WILFRED, SAINT, a Saxon bishop, one of the principal instruments by which the papal authority was extended to Britain. He was descended of a noble family of Bernicia, where he is said to have been born in the year 634. He was taught the use of arms and other accomplishments of a Saxon noble. At the age of thirteen he became subject to the authority of an unkind step-mother, from which he was relieved by being received into Queen Eanfleda's household. While only in his fourteenth year he was directed by the queen to be an attendant on an aged Saxon noble named Cudda, who had resolved to spend the remainder of his days as patron of a small monastery in Lindisfarne. It is said that Wilfred here devoted himself to theological reading, in the course of which he discovered the differences between the practice of the Scottish Church and that of the rest of the Christian world as to the observance of Easter, and conceived the design of visiting Rome, that he might obtain a satisfactory solution of the difficulty. In 653, when nineteen years old, he proceeded on his journey, accompanied by Benedict Biscop, who afterwards enjoyed a celebrity much resembling his own, and with recommendations from the courts of Bernicia and Kent. At Rome, where he remained for several months, he received special instruction on the subject as to which he had undertaken the journey, and on theological matters of more serious importance, from Archdeacon Boniface, by whom he was brought under the notice of the pope. In passing through Lyon he had secured the friendship of a powerful French prelate, Archbishop Delfinus, with whom he lived for three years on his return. Upon the fall of the Merovingian dynasty, Delfinus was put to death by Ebroin, mayor of the palace, and Wilfred narrowly escaped from sharing in his fate. Returning from the centre of ecclesiastical learning and authority, Wilfred naturally obtained a high influence among the Saxon Christians, by and ecclesiastical. From Alchfrid, king of Northumbria, he obtained a grant of land and a monastery at Ripon, within which, in 664, he was ordained a priest by Agilberct, bishop of the West Saxons. The ceremony was performed in time to give him a voice in the celebrated conference of Streanæshalch, or Whitby, where the Easter question and that of the tonsure were solemnly discussed. The Scoto-Irish clergy having so far diverged from the commonly received interpretation of the decision of the Council of Nice, regarding the time of Easter, as to solemnise it on the day of the full moon when that day fell upon a Sunday, instead of waiting till the ensuing Monday, and having also adopted a peculiar practice in the tonsure, or shaving of the head, the King of Northumbria, whose dominions were under the spiritual juris-diction of the Scottish bishops of Lindisfarne, was desirous that his clergy should conform to the practice of the rest of Christendom, or justify their divergence by authority. The conference was held at the monastery of Whitby, at the commencement of the year 664. His own practice was vindicated by Colman, bishop of Lindisfarne, on the example of St. Columba; but Wilfred adduced the higher authority of St. Peter, and the king decided in his favour. The jurisdiction of the Scottish bishops over Northumbria arose from the circumstance of the see of York having been left vacant. The king determined to fill the see, and his choice naturally fell on Wilfred. He saw difficulties in the way of being canonically consecrated in Britain, and proceeding to France, the ceremony was performed with much pomp by the same Agilberct who had ordained him priest, and who had become bishop of Paris. The ship in which he returned was driven by a storm on the coast of Sussex, where he and his followers narrowly escaped being plundered and enslaved by the barbarous and unconverted inhabitants. In the meantime the influence of the Scoto-Irish and British party in the Church had got one of their own number, Cedda, placed in the chair of York. Three years elapsed before Wilfred could get his claim enforced; but the arrival of the learned Theodore from Rome, and his elevation to the archiepiscopal see of Canterbury, decided the contest in favour of the Roman party in 669. Wilfred, in possession of a bishopric, soon showed the ambition and priestly pride of his character by enlarging the power of the Church and surrounding his own person with pomp and state. He carried on a bold contest for superiority on the side of the ecclesiastical against the kingly power, both of them but imperfectly developed, and depending for their extent very much on the personal character of the individuals who might wield them. He appears not to have been luxurious or sensual in his own personal habits; but he lived magnificently, kept a great table, and was surrounded by a body of attendants, which rivel in number and grandeur with the king's court. He was the first patron of ecclesiastical architecture in England. Rome and the other continental cities he had visited naturally filled his mind with magnificent conceptions, which he embodied in the embellishments of the cathedral church of York; covering the roof with lead, and filling the windows with glass. He built a church at Ripon of hewn stone, of which the great size and the columns and porticoes are the subject of admiration by the ecclesiastical annalists; and another at Hexham, which was called the finest ecclesiastical edifice on the western side of the Alps. He had a great influence over Ethelàrytha, the queen, whom he persuaded to retire to a nunnery. Either by his interference or his ambition he roused the anger of the victorious Ecgfrid, now king of Northumbria, who resolved to break his power by dividing his bishopric into three, a project in which Theodore, the archbishop, concurred. Refusing his assent, Wilfred was deposed. He proceeded to Rome, to make a personal appeal to the court; and on his way, being driven on the coast of Friesland, remained there for some time, converting the natives to Christianity. The pope naturally decided in his favour; but the king, instead of seconding the papal decree, committed Wilfred to prison, whence he escaped to the wastes of Sussex, where he devoted the energies of his active mind to the conversion and civilisation of the heathen inhabitants. Cæadwalla, who had been driven from his kingdom of Wessex, was aided in the recovery of it by Wilfred, and afterwards extended his authority over Sussex. Wilfred, powerfully befriended and supported by his eminent services to Christianity, was recalled to his see, and had hopes held out to him of succeeding Theodore as the primacy. The bishop however was still opposed to Wilfred as the head of the Roman party; and after the death of Theodore the primacy remained vacant for two years, and was then filled by Berctwald. This archbishop, soon after his accession, presided at a council held in 692, at which the old question of the division of the see of York was revived. Wilfred on this occasion took high ground, charging his opponents with schism and apostacy in resisting the head of the Church; and he was deposed and excommunicated. Wilfred again proceeded to Rome, where he had in his favour his zeal in support of the papal authority, and the countenance of his old patron, Boniface. He remained some years at Rome, and did not reach England on his return till 705. The authority he brought with him overawed his opponents; but age and decrepitude seem to have quenched his ambition, and he neither sought the primacy nor a restoration to his see of York. He died at his monastery of Oundle in 709, and his body was conveyed to Ripon, where it was interred.

WILKES, JOHN, was born at Clerkenwell, October 17th, 1727. His father, a distiller in that place, gave him a liberal education; for after he had spent several years at school in Hertford and in Buckinghamshire, he was sent, with a private tutor, to the university of Leyden. Wilkes did not neglect the opportunities afforded him, but evinced through life considerable scholarship and taste for classical literature and polite learning. He translated parts of Anacreon, and printed handsome editions of the Characters of Theophrastus and of the poems of Catullus. His manners were elegant, and his conversation pleasing and witty. At an early age his accomplishments secured him many friends of rank and influence, amongst whom may be mentioned Lord Temple, and Mr. Pitt, afterwards Lord Chatham. His devotion to literature and the society of eminent men did not secure his youth from vicious excesses. He was notorious for his dissipation and extravagance, and at an early age was embarrassed in fortune and tainted in character. In 1749 he married Miss Mead, of a Buckinghamshire family, but that lady was in two years divorced from himself, on their stipulations were by no means suitable. They continued to live together for some time, and a daughter was born of their marriage; but at length his excesses and mutual disagreement led to a separation. This was followed by a lawsuit concerning his wife's annuity, in which his character was exposed to much obloquy. His vices however were not destined to ruin him. Neither his character nor his talents would have raised him to political eminence; but the impolitic and illegal measures of his opponents made him the idol of the people.

The first appearance of Wilkes in public was in April 1754, when he addressed the electors of Berwick-upon-Tweed with a view of becoming their representative in parliament. He did not however succeed in obtaining a seat in the House of Commons until 1757, when he was returned for the borough of Aylesbury, for which place he was re-elected in the next parliament, in 1761. In March, 1762, he published a very successful pamphlet, being 'Observations on the Papers relative to the Rupture with Spain, laid before both Houses of Parliament on Friday, January 29, 1762.' It did not appear with his name, and Wilkes still shielded the authorship upon editing, in June of the same year he commenced the publication of his celebrated newspaper, the 'North Briton,' which he undertook in opposition to 'The Briton,' a paper written in defence of Lord Bute's administration. The unpopularity of Lord Bute was already very great, but the 'North Briton' increased it to an alarming extent, by stirring appeals to the passions and to national prejudices. The minister quailed before the clamour with which he was universally assailed, and withdrew from public affairs; but his known influence with the king, and the political complexion of the ministers under Mr. George Grenville, his successor, led to the belief that he still enjoyed a secret control over the national councils. Wilkes, with the assistance, it is said, of Charles Churchill and Lord Temple, continued his attacks upon the ministry with unabated activity. The government were watching an opportunity of punishing their mischievous opponent, and at length struck a blow which recoiled upon themselves. In No. 45 of his paper he charged the king with having uttered a falsehood in his speech from the throne; upon which a general warrant was issued by Lord Halifax, one of the principal secretaries of state, commanding the apprehension of the authors, printers, and publishers of the 'North Briton,' as a seditious and treasonable paper. By virtue of this warrant the house of Wilkes was entered by three king's messengers, his papers were searched, and he himself was seized and committed to the Tower. In a few days he was brought, by habeas

Digitized by Google

corpus, before the Court of Common Pleas, and discharged out of custody on account of his privilege as a member of the House of Commons. An information however was immediately exhibited against him by the attorney-general, to which he declined to appear. He was, at the same time, dismissed from his command in the militia, and his friend, Lord Temple, was deprived of his office of lord-lieutenant of Buckinghamshire.

On the meeting of parliament in November (1763), the House of Commons were acquainted, by a message from the king, with the proceedings that had been taken against their member, and a copy of the obnoxious number of the 'North Briton' was laid before them. They immediately resolved that the paper "was a false, scandalous, and seditious libel," and ordered it to be burnt by the hands of the common hangman. When the sheriffs of London proceeded to execute this sentence at the Royal Exchange they were insulted by the mob, and a riot ensued, the first of many tumults in the cause of Mr. Wilkes. That which had been intended as a disgrace and punishment to Mr. Wilkes was the commencement of a series of triumphs over the ministers and the parliament. The people had regarded his imprisonment by a general warrant as illegal and oppressive, and his paper, though adjudged libellous in higher quarters, was read by them with enthusiasm, and its author greeted everywhere with the loudest applause. On his liberation from the Tower, Wilkes had brought an action against the under-secretary of state for the seizure of his papers; and the cause now coming on for trial, he obtained a warrant in his favour, with 1000*l.* damages. On this occasion Chief Justice Pratt, afterwards Lord Camden, declared general warrants to be "unconstitutional, illegal, and absolutely void."

Meanwhile Wilkes had been called upon by the House of Commons to answer the charge of being the author of the libel, but excused himself on account of a wound which he had received in a duel. He shortly afterwards withdrew into France, whence he forwarded to the Speaker a certificate of his illness and inability to attend. The House disregarded his excuse, proceeded in his absence to inquire into the authorship of the 'North Briton,' and having proved Mr. Wilkes to be the author, expelled him the House, on the 19th of January 1764. On the 21st of February he was convicted in the Court of King's Bench of re-publishing No. 45 of the 'North Briton,' and of printing and publishing an 'Essay on Woman.' The latter was an obscene poem of which he had printed only 12 copies, and one of them had been surreptitiously obtained through a printer who had been employed at his private press. On receiving him of judgment, the ministers hoped to lower the enthusiasm of the people in his favour; but the means to which they had resorted in obtaining possession of the book, increased the indignation against the government, and the sympathy for the victim of ministerial persecution.

Wilkes remained abroad, and not appearing to receive judgment of the court, he was outlawed. He travelled on the continent for some years, but did not lose sight of his interests at home. He solicited pardon for the past, and employment or a pension for the future, and it is said that he obtained a pension of 1000*l.* a year from the Rockingham administration, paid out of their own salaries, viz., from the first lord of the treasury 300*l.*, from the lords of the treasury 60*l.* each, from the lords of trade 40*l.* each, &c. ('Letter of Mr. Horne,' in 'Junius,' ii. 204). He also published at Paris, in 1767, 'A Collection of the genuine Papers, Letters, &c., in the case of J. Wilkes, late Member for Aylesbury,' by which he hoped to keep alive the public interest in his favour. In 1768 he returned to England, and in March of that year offered himself as a candidate for the representation of the City of London. He succeeded in the 1247 votes, but in spite of the violent attachment of the populace, he failed in obtaining a majority. He then declared himself a candidate for the county of Middlesex, and on the 28th was returned by a large majority. Serious riots occurred at both these elections, and the court party declared that the city, and even the king's person, were in danger. Although an outlawry was hanging over his head, Wilkes was imprudently allowed to be at liberty all this time, and to appear on the hustings, and harangue immense mobs in London, Westminster, and Brentford. After his election he surrendered himself before the Court of King's Bench, but the court refused to commit him upon his outlawry, as moved by the attorney-general, and he was accordingly discharged. He was arrested immediately afterwards on a writ of 'capias utlagatum.' A tumult arose, and as the officers were conveying him to the King's Bench prison, he was rescued by the mob. Not thinking it prudent however to take advantage of the popular zeal, he went privately to prison after the dispersion of the mob. He was still under confinement at the meeting of parliament on the 10th of May, and a mob assembled before his prison to convey him in triumph to the House of Commons. A conflict ensued; the military were ordered to fire, and killed and wounded several of the rioters. The death of one person was brought in murder by the coroner's jury, and the magistrate who had given the order to fire was tried for that crime, but acquitted. This riot was distinguished by the popular party as the massacre in St. George's Fields, and formed the subject of angry complaints against the government. Mr. Wilkes's outlawry was afterwards reversed by Lord Mansfield, but judgment was pronounced upon him for his two libels, and he was sentenced to two fines of 500*l.* each, and to imprisonment for the two terms of ten and twelve months. Not contented with his imprisonment, the ministers devised fresh means of persecution against Mr. Wilkes, which, like their previous measures, increased his popularity and diminished their own. He had contrived to obtain a copy of a letter addressed by Lord Weymouth to the chairman of the quarter-sessions at Lambeth, before the riot in St. George's Fields; in which that nobleman recommended the early and effectual employment of the military to suppress disturbances. This letter was published by Mr. Wilkes with a preface, in which he charged the secretary of state with having "planned and determined upon the horrid massacre in St. George's Fields" three weeks before its execution. Lord Weymouth complained of this publication in the House of Lords as a breach of privilege. A complaint was addressed by the Lords to the Commons, and a conference held upon the subject. When Mr. Wilkes was brought to the bar to be heard upon a petition which he had presented, he avowed himself the publisher of Lord Weymouth's letter, and the author of the prefatory remarks; upon which the House resolved that his remarks were a scandalous and seditious libel, and, for the second time, expelled him.

A new writ was issued for Middlesex, and Mr. Wilkes was re-elected without opposition and without expense. The House resolved that this election was void by reason of the expulsion, and issued another writ. Mr. Wilkes was again chosen without a contest, when the House declared him incapable of being elected into that parliament. Notwithstanding this declaration of incapacity, he stood once more, when Mr. Dingley, his opponent, could not even obtain a nomination, and Wilkes was returned a third time without opposition. This election was likewise declared to be void, and the time a new expedient was resorted to; the government persuaded Colonel Luttrell to vacate his seat in parliament, and to oppose Mr. Wilkes in the approaching election. Mr. Wilkes was returned by an overwhelming majority, and his opponent mustered less than 300 votes, yet the House of Commons declared that Mr. Wilkes was incapable of being elected, and that Col. Luttrell, being next on the poll, and qualified to sit in parliament, was duly elected as member for the county. This violation of the rights of election was resented not only by the freeholders of Middlesex, but by the whole country. The battle was no longer between Mr. Wilkes and the ministers, but between the whole electoral body and the parliament. In the midst of petitions, addresses, and remonstrances, the letters of Junius inflamed the people and confounded the ministers. Truly did he say to the latter; "You have nothing in this country to rest upon but general constitutional point, on the decision of which our existence, as a free people, absolutely depends.' (Letter XI. to the Duke of Grafton.) Meanwhile the popular champion, through whose sides the constitution had been assailed, though still immured in the King's Bench prison, was receiving substantial marks of public favour. Subscriptions were opened for the payment of his fines and personal debts, and upwards of 20,000*l.* were raised for that purpose in the course of a few weeks. Presents of all kinds were also heaped upon him; plate, jewels, wine, furniture, and embroidered pieces of gold. His portrait was in universal request, and was reproduced in every form of art, from the marble bust to the village sign-board.

Another legal triumph soon followed. On the reversal of his outlawry, Mr. Wilkes had proceeded with an action against Lord Halifax for false imprisonment and the seizure of his papers. In November 1769, the cause was tried in the Common Pleas, when he obtained a verdict, with 4000*l.* damages, which were defrayed by the crown.

In the following April, Mr. Wilkes was discharged from his confinement, on giving a bond for his good behaviour during seven years. He was shortly afterwards admitted to the office of alderman for the ward of Farringdon Without, and aspired to other civic honours. He served as sheriff in 1771. In the two following years he was elected by the livery as one of the persons to be chosen lord mayor; and on his third examination, in 1774, was returned by the court of aldermen. On the 10th of October he was again elected for the county of Middlesex, and continued in the House of Commons for many years. But his popularity had declined: to use his own words, he was "a fire burned out," but the comforts of the lucrative office of chamberlain of the City of London, which he obtained in 1779, were an ample compensation for the loss of popular favour.

One political triumph however was still reserved for him. In the parliaments of 1774 and 1780 he had made many unsuccessful attempts to expunge from the journals, the resolutions of the House of Commons in regard to the Middlesex elections; but at length, on the dissolution of Lord North's administration in 1782, he accomplished his object. On the 3rd May, the House voted that the resolution of the 17th February 1769, by which he had been declared incapable of re-election, should be expunged from their journals, "it being subversive of the rights of the whole body of the electors of the kingdom." All the other resolutions and orders of the House concerning the Middlesex elections were also ordered to be expunged. In 1784 he was elected for the last time by the county of Middlesex; he did not offer himself again at the dissolution in 1790, but retired into private life. In retirement he lived to be forgotten, and died December 27, 1797, at the age of 70.

WILKIE, SIR DAVID, was born at the manse of the parish of Cults, on the banks of Eden-water, in Fifeshire, on the 18th of

Digitized by Google

November 1785. He was the third son of David Wilkie, minister of Cults, and Isabella Lister, his third wife. Wilkie displayed what may be termed an innate love for drawing when quite a child: he has been heard to say that he could draw before he could read, and paint before he could spell. It became at length evident to his father that young David would turn his attention to nothing but painting, and eventually he consented to allow him to follow his own inclination. He was accordingly sent, in 1799, to the Trustees' Academy at Edinburgh. John Graham was master of the academy at this time, and Sir William Allan and John Burnet were Wilkie's fellow-scholars. The progress Wilkie made at this time, says Sir William Allan, "was marvellous. Everything he attempted indicated a knowledge far beyond his years; and he soon took up that position in art which he maintained to the last. He was always on the look-out for character: he frequented tryste, fairs, and market-places."

In 1803 he won the ten-guinea premium that was awarded in that year, for the best painting of 'Callisto in the bath of Diana.' In the same year he made the sketch of his picture of the 'Village Politicians.' In 1804, in his nineteenth year, he left the academy and returned home. At home he painted in the same year, for Kinnear of Kinloch, his picture of 'Pitlessie Fair,' in which he inserted about 140 figures, mostly portraits, many of which he sketched while at church, as he had no other way of procuring them. For this picture he received only 25*l*. He painted likewise at this time many portraits in small and in miniature, and the picture called the 'Village Recruit,' which he took with him to London soon after it was finished, and exposed for sale in a shop-window at Charing-cross, and at the low price it was marked, 6*l*., it soon found a purchaser. After he had found a lodging in No. 3, Norton-street, Wilkie set to work in obtaining admission as a student at the Royal Academy. The young painter's first patron in London was Stodart, the pianoforte-maker, who happened to be married to a Wilkie, and had a taste for painting as well as music. He sat to Wilkie for his portrait, and when he found a purchaser for him, introduced him to a valuable connection, and procured him several sitters. The Earl of Mansfield, to whom Wilkie had been introduced by Stodart, commissioned him to paint a picture from his sketch of the 'Village Politicians,' for which Wilkie demanded fifteen guineas; but the earl merely said, "County your friends about the price." When however the picture was finished and exhibited in the Royal Academy in 1806, it excited such universal admiration, that Wilkie was advised not to sell it for less than 30 guineas. The painter accordingly demanded 30 guineas of the earl, who paid the money, but first interpreted his right to make any such demand. Wilkie followed the earl's advice, "consult your friends," in justification of his proceeding. He had been offered from two other parties 100*l*. for the picture.

From this time commissions were abundant, and instead of returning to Scotland, as he had intended, he found it necessary to establish himself in London. He received commissions from Mr. Whitbread, Lord Mulgrave, and Sir George Beaumont, who until his death proved a most sincere and valuable friend to Wilkie. The picture of the 'Village Politicians' was painted from the "ale cann commentators," in the ballad of 'Will and Jean,' by Burnett. As far as production of a living artist, it was a thing quite new to the English painters of that time, and various comments were made upon it by the academicians. Northcote termed it the "pauper style;" and Fuseli, when he met Wilkie, after he had seen it, said, "Young man, that is a dangerous work. That picture will either prove the most happy or the most unfortunate work of your life." It apparently proved to be the most fortunate; and although Wilkie was only twenty-one when he painted it, as a painting he never surpassed it afterwards, though in subject he produced several happier pictures. His next works were, 'The Blind Fiddler,' for Sir George Beaumont; 'Alfred in the Neatherd's Cottage,' for Mr. Davidson; the 'Card-Players,' for the Duke of Gloucester; and the 'Rent-Day,' for the Earl of Mulgrave: painted in 1807 and 1808. He then painted the 'Sick Lady,' the 'Jew's-Harp,' and the 'Cut Finger.' After these, the sketch of the 'Reading of the Will,' the 'Wardrobe Ransacked,' the 'Game-Keeper,' and the 'Ale-House Door,' afterwards called the 'Village Festival,' painted for Mr. Angerstein for 600 guineas, and now in the National Gallery: all painted in 1809, 1810, and 1811. In 1809 he was elected an Associate of the Royal Academy, and a member in 1811.

Wilkie was naturally of a weak constitution, and his incessant application to his profession rendered necessary at this time a suspension of all exertion; and this, together with the declining state of his father's health, induced him to pay a visit to his native place, where he arrived in August 1811. In October of the same year he returned to his easel in some new apartments at Kensington, as being the most healthy part of the metropolis.

On the 1st of May 1812 he opened an exhibition at 87, Pall Mall, of all his pictures, twenty-nine in number, including sketches (some of which however were painted after the pictures), from which he expected to derive considerable profit; but although it extended his reputation, it appears to have been a very unprofitable expedient. The expense of the exhibition amounted to 414*l*. In December of this year he lost his father, and he invited his mother and sister to come to live with him in London, where he took a commodious house in Kensington, 24, Lower Phillimore Place, to receive them in. In 1813 he exhibited his picture of 'Blindman's Buff,' which he painted for the Prince Regent. The prices Wilkie now received were very different from those which he had for his early pictures. For the 'Letter of Introduction,' and the 'Refusal,' or 'Duncan Gray,' both small pictures, painted in 1813, he received respectively 250 and 300 guineas, yet he was not making 600*l*. a year. He returned his income in 1813 for the income-tax, according to the average of three years, and making the necessary reduction for his house, at 500*l*.

In 1814 he went with his friend Mr. Haydon to Paris, and carefully studied the pictures which Napoleon had collected in that city—the spoils of the churches and galleries of the Continent. In 1814 and 1815 he painted 'Distraining for Rent,' the 'Pedlar,' and the 'Rabbit on the Wall.' The proprietors of the British Institution purchased the first for 600 guineas. In the summer of 1816 he went with Haydon, the engraver, to Holland and Belgium. In 1816 he painted the 'Breakfast' for the Marquis of Stafford. In 1817 he painted his only landscape, a piece called 'Sheep-Washing.' For the 'Breakfast' the Marquis of Stafford paid him 400*l*. In 1817 also he commenced a picture for the Duke of Wellington, the 'Chelsea Pensioners,' and another, the 'Penny Wedding,' for the Prince Regent. In the same year he paid a visit to Scotland and Sir Walter (then Mr.) Scott, of whom and family he painted an interesting picture; he also made at this time a sketch for his picture of the 'Whiskey-Still.' After his return to London the authorities of Cupar sent him the freedom of the burgh. In 1818 he painted the 'Errand-Boy,' 'Chimp-Menders,' 'Death of Sir Philip Sidney,' all small pieces, and finished the 'Penny Wedding' and the 'Whiskey-Still.' For the 'Wedding' he received 545*l*., including frame. In 1819 he commenced the 'Reading of the Will,' for the King of Bavaria, which he finished in the following year, and was paid 447*l*. 10*s*. for it. In 1821 he painted his 'Chelsea Pensioners,' which was exhibited in 1822. This picture, painted for the Duke of Wellington for 1200 guineas, is certainly Wilkie's master-piece; it is of its class the finest work which has been painted in England, and ranks Wilkie among the most celebrated masters of the Dutch school. The colouring is sober and true, the drawing good, and the character, composition, and execution exquisite: almost its only bad point is the head and figure of the female to the right; but Wilkie seldom introduced females into his earlier pictures, and never when he did he generally failed. The subject of this picture is a veteran reading to some Chelsea pensioners the Gazette of the battle of Waterloo, which had been just brought by an orderly of the Marquis of Anglesey's lancers.

We have now traced Wilkie's progress, with a few exceptions, from the first to the last of those works of his upon which his future fame will rest—the 'Village Politicians,' and the 'Chelsea Pensioners.' After the last-named picture he produced many excell-nt works, but it is generally allowed that he did not add anything to his reputation. His later works were certainly not sufficient even to uphold his reputation which Wilkie had acquired. He not only changed his subjects, but he changed his style of execution also. In his own peculiar style he was without a rival; in the style which he at this time adopted he had many superiors. One of the worst and earliest of these new productions was the 'Entrance of George IV. into Holyrood,' a picture confusedly composed, flat and ill-executed, and ill-drawn. At the death of Sir Henry Raeburn, in 1823, Wilkie was appointed limner to the king in Scotland. In 1824 he lost his mother and one of his brothers, and he suffered himself so much from ill-health that he determined upon a protracted visit to the Continent. He set out with a friend and cousin in the summer of 1825 for Paris, from whence to Switzerland and Italy. In Italy Wilkie remained eight months. He then visited Munich, Dresden, Teplitz, Carlsbad, Prague, and Vienna, and returned for another season to Italy. At Rome, on his second visit, a public dinner was given to him by the Scotch artists and amateurs, at which the Duke of Hamilton presided. During his second visit to Italy his health began to revive, and he painted three pictures at Rome. From Italy he went through the south of France, entered Spain in October 1827, and travelled to Madrid. In Madrid he painted a picture of a Spanish Council of War, and two other Spanish subjects, one of which was the 'Defence of Saragossa,' in which he inserted the portrait of General Palafox, the defender of the place. In the summer he left Spain, and reached Paris in June 1828, and returned to England in the same month, after an absence of three years. In the exhibition of 1829 he had eight pictures, four Italian, three Spanish, and a portrait of the Earl of Kellie. The three Spanish and two of the Italian were purchased by George IV. In the same year he painted a portrait of the king in Scotch dress. Some of these pictures were much admired by his friends, but far less by the public. The principal characteristics are effect of colour and light and shade, which, with breadth and facility, he appears to have now considered the proper objects of his art, and an advance beyond the truth, simplicity, and character of his earlier works. Of this new style, in a letter from Spain he speaks as follows:—"I have now, from the study of the old masters, adopted a bolder and, I think, more effective style, and one result is *rapidity*." In other letters he speaks of his imitation of Rembrandt, Correggio, and Velasquez. These pictures seem to be perishing almost as rapidly as they were painted; whilst many of his earlier works are in excellent preservation, many of these are mere wrecks. After the death of Sir Thomas Lawrence, in 1830, Wilkie was appointed in his place painter in ordinary to his

Digitized by Google

Majesty. He was also a candidate for the office of president of the Academy; but there was only one vote in his favour, Sir M. A. Shee being the successful candidate.

In the same year he exhibited his full-length portrait of George IV. in a Highland dress, and the king's entrance into Holyrood. In 1831 his only works in the exhibition were portraits of Lady Lyndhurst and Lord Melville. In 1832 he exhibited his celebrated picture of 'John Knox preaching the Reformation in St. Andrews,' painted for Sir R. Peel for 1200 guineas; and a full-length of William IV. In 1833 he exhibited a portrait of the Duke of Sussex in a Highland dress. In 1834 he exhibited six pictures, of which were portraits, among them the Duke of Wellington and Queen Adelaide. In 1835 he again exhibited six pictures, the great attraction of which was his picture of 'Christopher Columbus submitting the chart of his Voyage for the discovery of the New World to the Spanish authorities:' three of the others were portraits. His next principal works were, 'Peep-o'-Day Boy,' painted after a visit to Ireland; and 'Napoleon and the Pope in conference at Fontainebleau,' exhibited in 1836. In this year he was knighted by William IV.; and he removed to a more spacious house, in Vicarage-place, Kensington. In 1837 appeared his 'Mary, Queen of Scots, escaping from Loch Leven;' 'the Empress Josephine and the Fortune-teller;' and the 'Cotter's Saturday Night.' In 1838, the Queen's First Council and a portrait of O'Connell. In 1839, his large picture of 'Sir David Baird discovering the body of Sultan Tippoo Saib after storming Seringapatam,' painted for Lady Baird for 1500 guineas. In 1840 Wilkie exhibited eight pieces: the most striking was that of 'Benvenuto Cellini presenting for the approval of Pope Paul III. a silver Vase of his own workmanship.' His portrait of Queen Victoria, exhibited at the same time, was generally considered a complete failure.

In the autumn of 1840 Sir David was suddenly left with his friend Mr. Woodburn upon his tour to the East: various rumours were circulated as the cause of his journey, but probably none quite correct. He went by Holland and the Rhine to the south of Germany, thence to Constantinople by the Danube. At Constantinople he painted a portrait of the young Sultan, who gave him four sittings. On January the 12th, Wilkie and his friend left Constantinople by steam for Smyrna, where they arrived on the 14th. They left Smyrna on the 1st of February, arrived at Rhodes on the 2nd, and at Beyrout on the 9th. At this time, says Wilkie, 'my weather was "remarkably fine, mild, and beautiful, like the summer in England." They arrived at Jaffa on the 25th, and at Jerusalem on the 27th of the same month, after a journey from England of six months and twelve days. Wilkie describes as follows the impression made upon him by the sight of Jerusalem—after ascending an olive-tree on the road from Jaffa, he says, "We saw—and, oh, what a sight!—the splendid walled city of Jerusalem. This struck me as unlike all other cities: it recalled the imaginations of Nicolas Poussin—a city not for every day, not for the present, but for all time." While in the Holy Land he visited the Dead Sea, and tested its level by the barometer of Mr. J. Harvey, who had lent it to Sir David for that purpose. On the 17th of April they left Jerusalem for Jaffa, and that place on the 8th for Damietta in Egypt, whence they started on the 22nd for Alexandria. At Alexandria Wilkie complained of illness; he had felt slightly unwell for the last three months. He commenced a portrait of Mehemet Ali at Alexandria, who wished the portrait for himself, and sat very patiently two hours and a half the first sitting. On the 21st of May he embarked on board the Oriental for Malta; on the 26th he arrived at Malta. On the 1st of June he expired off Gibraltar, and at half-past eight in the evening of the same day his body was committed to the deep, in lat. 36° 20′ and long. 6° 42′: the burial service was performed by the Rev. James Vaughan, rector of Wrotsall, near Bath. His death appears to have been hastened by imprudently indulging in fruit and iced lemonade at Malta. On the 28th of August 1841, a meeting of the friends of Sir David Wilkie took place at the Thatched House Tavern, St. James's-street, at which Sir Robert Peel presided. The result of the meeting was a subscription for the purpose of erecting a suitable monument to the painter; and a statue of Sir David Wilkie was accordingly executed by Mr. Joseph, and placed in the inner hall of the National Gallery.

Wilkie was tall and of sandy complexion, with sharp eyes, was polite and mild in his manners, was a staunch lover of everything Scotch, appears to have been of no party in politics, but shows in his letters an undue respect for the high in place and the wealthy. As a painter, he was slow, and required models upon all occasions. In the fragments of a journal printed in his Life by Allan Cunningham, 3 vols., 8vo, 1843, there are many details relating to his studies, which are interesting to the artist; in the same work there are a series of remarks upon painting by Wilkie, which contain many sound views, and are in parts well written.

Wilkie's works are well known by the excellent engravings of Raimbach, Burnet, Cousins, Doo, and C. Fox. A set of coloured prints in imitation of Sir David's original sketches was published after his death. To the 'Life of Wilkie' already referred to there is an appendix containing a list of all his works, with the proprietors' names, and the prices received for them by the painter. At the sale of his effects, which realised several thousand pounds, there were many unfinished works, some of which were sold at very high prices; an unfinished picture of 'The School' sold for 700*l*.

WILKIE, WILLIAM, D.D., who enjoyed among his literary friends the title of 'the Scottish Homer,' was born at Ecclin in Linlithgowshire, N. B., on the 5th of October 1721. His inclination for poetry was early developed, and in the ninth volume of Sir John Sinclair's 'Statistical Account of Scotland' there are some verses which he is said to have written at the age of ten. He entered the University of Edinburgh at the age of thirteen. Before he had completed his academical studies, his father, a farmer near Edinburgh, died, leaving him the current lease of his farm, and the duty of providing for three sisters. He thus became a practical farmer, and bringing his mind to bear on that pursuit, he astonished his neighbourhood by the variety and the theoretical character of his operations, and still more by the success with which many of them were rewarded. In the meantime he partially continued his studies; and having taken orders in the Church of Scotland, his clerical profession and his zeal for the cultivation of potatoes procured him the title of 'the potatoes minister.' At this time he conducted three distinct occupations: he was an active farmer, frequently labouring with his own hand; he wrote epic poetry; and he occasionally preached in the parish church. In 1757 he published 'The Epigoniad, a Poem, in nine books.' The name was unfortunate, for it carried no associations to render the subject recognisable. The main incident was the sacking of Thebes by the Epigoni, or descendants of those who had been slain at the first siege of the city. It was an attempt to produce an epic poem, and, though it showed much scholarship and imagination, the attempt failed. The work is now very little known, though it has been published in some of the collections of the British Poets. At the time when the 'Epigoniad' appeared, there was an intense anxiety among Scotsmen to produce rivals of all the great names in every department of literature; and as Home was to be the Shakspere, Wilkie was to be the Homer of Scotland. The English critics found much food for ridicule in the Scotticisms of the 'Epigoniad,' and Hume wrote a vindication of it, at great length, in the 'Critical Review.' A second edition of this poem was published in 1759, accompanied by 'A Dream, in the manner of Spenser.' In 1753 Wilkie was ordained assistant and successor to the clergyman of Ratho, a parish near Edinburgh. In 1759 he was chosen Professor of Natural Philosophy at St. Andrews. In 1768 he published a volume of 'Moral Fables,' in verse, which suffered the fate of his epic. He died on the 10th of October 1772. He was a man of great learning. His eccentricities are the subject of many curious literary anecdotes. His manners were rude, and his habits filthy; and the contrast between these peculiarities and the stores of learning and genius which he exhibited in conversation drew from Charles Townsend the remark, "that he had never met with a man who approached so near to the two extremes of a god and a brute as Dr. Wilkie."

WILKINS, SIR CHARLES, Knight and K.C.H., was born in the year 1749, at Frome in Somersetshire. His father, Walter, derived his descent from an ancestor of the same name, Bishop Wilkins, Bishop of Chester. An uncle, Mr. Charles Wray, from whom Mr. Wilkins derived his baptismal name, was a partner of Messrs. Hoares, the bankers, in Fleet-street. This gentleman, having received the offer of a writership on the Bengal establishment, accepted it for his nephew. Mr. Wilkins arrived at Calcutta in 1770, and in the course of a few years found means amidst his duties as a writer to make considerable progress in the knowledge of Arabic and Persian, as well as of some of the spoken languages of India. He effected this at a time when such studies were generally neglected, and when no part of them had yet been made compulsory. In 1778 he aided the efforts of the Governor-general Hastings for improving the education of the Company's servants by printing the Bengalee grammar of Halhed, who, in his preface, informs us that after having failed to obtain types of the Bengalee character from the oldest artists in London, he had had recourse to Mr. Wilkins, whose success was complete. "This book," Mr. Halhed observes, "will always bear an intrinsic value from its containing as extraordinary an instance of mechanic abilities as has perhaps ever appeared. In a country so remote from all connection with European artists, Mr. Wilkins was obliged to charge himself with the various occupations of metallurgist, engraver, founder, and printer." Mr. Hastings, in a letter to the chairman of the Court of Directors, remarks, that "to the ingenuity of Mr. Wilkins, assisted by models for imitation or by artists for his direction, the government was indebted for its printing-office, and for the many official purposes to which it had been applied." Lord Teignmouth also, in his 'Life of Sir William Jones,' attests, that "the art of printing had been introduced into Bengal by the untaught skill of Mr. Wilkins, and had advanced to great perfection, and that many publications equally useful and interesting had issued from the press which he had established."

In the same manner Mr. Wilkins formed a set of Persian types, which, as well as the Bengalee, continued to be employed for the service of the Company. As his proficiency in the native languages advanced, he became more convinced of the importance of endeavouring to make himself master of that parent dialect which he found diffused over them all, and which is the depository of the learning and science of India. He continued therefore during the remainder of his residence in that country to follow this hitherto untrodden path of science, and thus has justly obtained the title of 'the Father of Sanskrit Literature.' He was fortunate in having been the contemporary in India of Mr. Hastings and Sir William Jones, and of enjoying the

Digitized by Google

intimate friendship of those distinguished men, who took the most lively interest in his literary pursuits, and whose approbation stimulated his exertions; nor can it be doubted that his knowledge of the Oriental languages, and the salutary influence which his Sanskrit learning gave him over everything connected with the Brahmins, were often eminently useful in the civil and judicial government of India. In some manuscript letters of Sir William Jones's addressed to Mr. Wilkins, which are in the possession of his family, are numerous instances of Sir William's reference to him in aid of his own studies in Sanskrit, as well as relating to questions connected with his judicial office. In one of these letters he says, "You are the first European who ever understood Sanskrit." In another, "it is of the utmost importance that the stream of Hindoo law should be pure, for we are entirely at the mercy of the Hindoo lawyers through our ignorance of Sanskrit."

In the year 1784 Mr. Wilkins was instrumental, in union with the same accomplished scholar, in establishing the Asiatic Society of Bengal, whose publications, called 'The Asiatic Researches,' were regarded with the greatest interest by the learned of Europe. A separate work however of his own operated perhaps still more strongly to excite curiosity, and to give hopes of an ample harvest in the field of Sanskrit letters: namely, his translation of the Bhagvatgita, one of the Episodes of the Mahabhárata, or great national poem of the Hindoos. This translation having been transmitted in manuscript by the governor-general to the chairman of the Court of Directors in 1785, with a recommendation that it should be published, was printed accordingly at the expense of the Company, together with the annexed letter of Mr. Hastings before alluded to, in which a then unprecedented state-man took occasion to communicate his views on the encouragement necessary to be given by the government of India to the cultivation of languages and science. In 1786 the decline of Mr. Wilkins's health, caused by the unremitted attention given to his studies and public duties, rendered necessary his return to Europe. At Bath in the following year he published an English translation of the 'Hitopadésa of Vishnu Sarma,' being the Sanskrit original of that Persian collection of fables, the French and English versions of which are known by the name of the 'Fables of Pilpay.' Not long afterwards he began to arrange the materials for a Sanskrit grammar, which he had brought with him from India; and at his residence at Hawkhurst in Kent, following the same method which he had employed at Hooghly with the Bengalee types, he formed with his own hands a set of Devanágari characters in steel, made matrices and moulds, and cast from them a fount of types. He had already printed twenty pages of the grammar, when, in May 1796, his house was burnt to the ground, and so suddenly that although his books and manuscripts were saved, together with the greater part of the punches and matrices, the types were lost or rendered useless. A copy of the printed pages had been sent to his friend the late William Marsden, Esq. [MARSDEN, WILLIAM], and is probably the only one extant. This misfortune, added to other circumstances, prevented the resumption of his labours till 1806, when, soon after the formation of the East India College at Hertford, the study of Sanskrit having become one of the most desirable branches of the system of education there established, Mr. Wilkins zealously aided this object, the grammar was speedily completed, new letters were cast, and in less than two years this, the greatest of Mr. Wilkins's works, was published.

In 1801 he had been appointed librarian to the East India Company. Under his fostering care the library and museum attained a degree of importance, utility, and interest which they had not before possessed; and became an attraction to visitors both native and foreign, who, in common with those connected with India continually resorting thither, were not less gratified by the obliging attentions of the librarian, than impressed with admiration of his profound and extensive knowledge: an elegant testimony to this effect is to be found in the amusing romance of 'Hadji Baba.' In 1805 he became visitor and examiner of the students in the Oriental department both at Haileybury and at Addiscombe. These offices he held and performed the duties of them, with scarcely any intermission, until his death, which occurred on the 13th of May 1836, within a few days of attaining his eighty-seventh year. To such a degree did he enjoy the faculties of his mind to the last, that, not many days before the short illness which preceded his decease, he made, at the request of the president of the Board of Control, a translation of a letter from the Imam of Muscat, and forwarded it to that minister. Sir Charles Wilkins was twice married, and left three daughters.

The published works of Sir Charles Wilkins, beside those already mentioned, are a new edition of Richardson's 'Arabic and Persian Dictionary' (1806-10), and the rules of the Sanskrit language (1815). In Dalrymple's 'Oriental Repertory' are found also a translation of the Dushwarta and Sakoontala, an episode of the Mahabhárata; and in the 'Annals of Oriental Literature' another portion of a translation of the same great poem. To these may be added some papers in the early volumes of the 'Asiatic Researches.' Among his unpublished translations from the Sanskrit are 'The Institutes of Menu,' of which he had completed more than two-thirds, when he was induced to desist by the knowledge that Sir William Jones was engaged on the same work, and which the latter published in 1794. Mr. Wilkins was a member of the Royal Institute of Paris, and of many other learned societies abroad as well as at home. In 1825 the Royal Society of Literature presented to him their gold medal, bearing the inscription 'Carolo Wilkins, Literatum Sanscritæ Princip.' In 1833 George IV. conferred on him the honour of knight bachelor and knight commander of the Guelphic order.

WILKINS, JOHN, Bishop of Chester in the reign of Charles II., was, according to Anthony à Wood, "a person endowed with rare gifts," "a noted theologist and preacher, a curious critic in several matters, an excell-nt mathematician and experimentist, and one as well seen in mechanisme and new philosophy (of which he was a great promoter) as any of his time." He was the son of Walter Wilkins, a goldsmith and citizen of Oxford, but was born at the residence of his maternal grandfather, John Dod (a nonconformist of some note, and author of several theological works, from one of which, an exposition of the Ten Commandments, he is styled 'the Decalogist') at Fawsley, near Daventry in Northamptonshire, in 1614. Wilkins appears to have remained with his grandfather until he arrived at a proper age for entering a grammar-school, when his father placed him under Mr. Edward Sylvester, an Oxford schoolmaster. In Easter Term 1627, at the age of thirteen, he was admitted a student at New Inn Hall, whence he shortly removed to Magdalen Hall, where for a short time he was under the tuition of John Tombes, the celebrated Anabaptist and opponent of Baxter. Tombes left the university while Wilkins was an under-graduate, and he did not proceed to his first degree at the usual time; but he took the degree of B.A. on the 20th of October 1631, and that of M.A. on the 11th of June 1634. Having then arrived at the age of twenty-six, he took orders, and became successively chaplain to William, Lord Say, George, Lord Berkeley, and Charles, Count-palatine of the Rhine, with whom he resided for a considerable time while he was in England. The skill of Wilkins in the mathematics, to which that prince was much attached, is said to have been his chief recommendation for the last-mentioned appointment, which gave him much opportunity for prosecuting his favourite studies. During this time he wrote several small treatises on mechanical philosophy. His early education had given him a strong bias towards puritanical principles, and accordingly on the breaking out of the civil war he took part with the parliament and Presbyterians, and became a party to the Solemn League and Covenant. Academical studies at the universities being much interrupted by the disturbances of that period, Wilkins assiduously promoted those meetings in London which afterwards led to the formation of the Royal Society. According to Bishop Sprat and Dr. Wallis, indeed, he was the principal promoter of the meetings referred to, at which political and theological discussions were strictly avoided, while every branch of natural philosophy was made a subject of inquiry. In 1648 he was selected by a committee appointed for the reformation of the University of Oxford to fill the office of warden of Wadham College, and on the 13th of April, having taken the degree of B.D. on the preceding day, he was put in possession of the wardenship, which was rendered vacant by the ejection of the loyalist warden, Mr. John Pitt. On the 18th of December 1649 he became D.D., and about the same time he took the required engagement of fidelity to the new commonwealth. Being unable after his removal from London to attend the philosophical meetings, he took part in the establishment of a similar association of similar objects, at Oxford, and in the year 1652, prior to which the society had met at the lodgings of Dr. Petty, to the end of his wardenship, the meetings were held in Wadham College.

In or about the year 1656 Wilkins married Robina, widow of Peter French, and sister of Oliver Cromwell, from whom he obtained a dispensation for retaining his office, notwithstanding the rules of the college, which imposed celibacy on the warden. Burnet states, in his 'History of his Own Time,' that he made no other use of this alliance "but to gain good offices, and to secure the University of Oxford from the sourness of Owen and Goodwin." In the early part of 1659, after the death of Oliver, Richard Cromwell appointed Wilkins master of Trinity College, Cambridge, and there also he exerted himself to increase a taste for experimental philosophy, as well as to substitute a more liberal and universal henceforward for academical studies. At the Restoration, in the following year, he was ejected from his mastership, and for some time he remained out of favour, both at court and with the archbishop of Canterbury, on account of his marriage. While his fortunes were at this low ebb, Wilkins was chosen preacher to the Society of Gray's Inn, and being thus again brought to reside in London, he entered with ardour into the proceedings of the philosophical association with which he had formerly been connected, and which now assumed a more organised form. In 1662 he was presented to the rectory of St. Lawrence, Jewry, in the gift of the crown, and on the formation of the Royal Society in the following year, he became one of the council. Having obtained favour at court, he was soon promoted to the deanery of Ripon, and in 1668 to the bishopric of Chester, to which he was consecrated on the 15th of November: Dr. Tillotson, who had married his step-daughter, preached his consecration sermon. It is related that he obtained this bishopric through the interest of the Duke of Buckingham; and Walter Pope, in his Life of Seth Ward, bishop of Salisbury, said that he had it not only with, but against the consent of the archbishop of Canterbury (Sheldon), who subsequently, after he knew him personally, declared that the

Digitized by Google

prejudice which he had entertained against him was unjust. Wilkins died November 19, 1672, of a suppression of urine, which was mistaken for stone, and mistreated. He was at the time of his death at Tillotson's house in Chancery-lane, London, and he was buried in the church of St. Lawrence, Jewry. Tillotson was appointed executor to his will, which gave 400*l.* to the Royal Society and 200*l.* to Wadham College. In Bliss's edition of the 'Athenæ Oxonienses' are notices of a few other ecclesiastical preferments of Wilkins, not mentioned above.

Wilkins's opinions on ecclesiastical subjects exposed him to much animadversion; but even those who were opposed to him in opinion bear testimony to his superior talents. Wood, whose panegyric has been quoted, observes that he could not say "that there was anything deficient in him but a constant mind and settled principles;" and other writers allude to his character in similar terms. His avowed moderation and toleration to dissenters, and his readiness to swear allegiance to the ruling power, whatever that might be, are the points most dwelt upon by those who take an unfavourable view of his character; but his benevolence does not appear to be impugned, and he is said to have possessed a courage which enabled him to stand against the current reproaches which less kindly-disposed clergymen were ready to heap on him.

Some of Wilkins's works are exceedingly curious, although, as might be expected from the state of science in his day, they contain much that is chimerical and absurd. The principal are the following:—1, 'Discovery of a New World;' or a discourse tending to prove that it is probable that there may be another habitable world in the Moon; with a discourse concerning the possibility of a passage thither.' This work, which appeared in 1638, and went several times reprinted, excited much ridicule; the last of the fourteen propositions which the author endeavours to establish—that it is possible for some of our posterity to find out a conveyance to the other world which he supposes to exist in the moon, and if there be inhabitants there, to have commerce with them,—is perhaps the only one that would now be generally regarded as absurd. Wilkins however endeavours to prove that the construction of a flying-machine of sufficient capacity for such a voyage is by no means the chimerical absurdity which most, even in the present day, would consider it. 2, 'Discourse concerning a new Planet,' tending to prove that it is probable our Earth is one of the Planets,' published in 1640. These two works appeared anonymously, but were well known to be by Wilkins. 3, 'Mercury, or the Secret and Swift Messenger; shewing how a man may with privacy and speed communicate his Thoughts to a Friend at any distance.' This curious volume contains antices of a great number of schemes for telegraphic communication, writing by cipher or in sympathetic inks, and other means of secret or rapid communication. One chapter, the eighteenth, is devoted to suggestions for "a language to consist only of tones and the musical notes, without any articulate sound." 4, 'Mathematical Magic, or the Wonders that may be performed by Mechanical Geometry,' a singular work, the object of which is tolerably defined by its title, published in 1648. 5, 'In 1668 appeared in one folio volume, printed by order of the Royal Society, an "Essay towards a Real Character and a Philosophical Language,' a work founded upon or suggested by a treatise published a few years previously by George Dalgarno. To this is appended an 'Alphabetical Dictionary, wherein all English words, according to their various significations, are either referred to their places in the Philosophical Tables (in the Essay) or explained by such words as are in those tables.' The first four of the preceding works were reprinted in 1708, and again in 1802, in a collected form, together with an abstract of the 'Essay towards a Real Character.' Wilkins also published several theological works, of which 'Ecclesiastes, or a Discourse of the Gift of Preaching as it falls under the Rules of Art,' passed through several editions, the first having appeared in 1646. His 'Discourse concerning the Beauty of Providence,' in all the Diagonal Passages of it,' first published in 1649, and 'Discourse concerning the Gift of Prayer,' published in 1651, were also repeatedly reprinted. Wilkins left his papers to the care of his friend Tillotson, allowing him to use his own discretion as to publishing any of them; and in 1675 appeared a treatise 'Of the Principles and Duties of Natural Religion,' which he had left in an unfinished state. In 1682 Tillotson published a volume containing fifteen of Wilkins's sermons, and some others were published separately during his life and also after his decease.

WILKINS, WILLIAM, was born August 31, 1778, in the parish of St. Giles, Norwich. His father was a builder and architect of some eminence also named William, who practised at Norwich, but later in life removed to Cambridge: he was the author of an 'Essay on Norwich Castle,' in vol. xii. of the 'Archæologia.' Young Wilkins received his early education at the Free Grammar School, Norwich, was matriculated at Gonville and Caius College, Cambridge, in 1796; and graduated as sixth wrangler in 1800. Having in the following year obtained a travelling bachelorship, he visited Italy and Greece; and almost immediately after his return, published his 'Antiquities of Magna Græcia,' imperial folio, 1807, a work rather unsatisfactorily executed and not containing much of particular interest to professional students, owing to which it was coldly received by architects. It was however well calculated to recommend the author to scholars and obtain for him the patronage of the university, nor did it fail to do so. In the same year (1807) he was employed as architect of Downing College, and the buildings were forthwith begun. They were left at his death very far from being completed. Wilkins in these buildings threw away a rare opportunity. Biassed by his previous studies, and ambitious of giving his own university a classical piece of architecture, he postponed all other considerations to that alone. Enamoured of the study of the Grecian style, he seems neither to have thought how far that style could be adapted to the occasion, nor how far the occasion required what the style would not admit of. Instead of even endeavouring to adapt it, he merely applied it, just as he found it, to designs of low buildings which derive their only impression merely from their columns, for in other respects they are merely so many neat houses. Neither does the building make amends in other respects for its unsatisfactoriness as a piece of architecture, the accommodation it affords being very defective, although the cost was enormous.

In the case of the East India College at Hailey bury, Herts, which he built a few years afterwards, when he held the appointment of architect to the East India Company, there were at least no local associations to deter him from having recourse again to 'pure Greek' architecture; but it is somewhat strange that, instead of endeavouring to improve upon his specimen at Cambridge, he should have done little more than repeat the same design, and with little more success. He afterwards succeeded somewhat better when he had to adopt gothic for the additions and alterations which he executed in the three colleges of Trinity (1823), Corpus (1823), and King's (1828) at Cambridge; at least they were at the time regarded as rather creditable than otherwise, though they would now be considered to evince a somewhat extraordinary ignorance of the true character of gothic architecture.

In the façade of the University College, Gower-street, originally called the University of London, he introduced a dome in combination with a Grecian portico; and elevated the latter upon a substructure the height of the basement floor, forming a picturesque arrangement of flights of steps. Of all his works perhaps this is the one which obtained for him most praise from both professional men and critics; but unfortunately the wings have not yet been erected, and those parts of the exterior to which they would have been connected still remain in their first unfinished state: as such the interior was anything but convenient and has been considerably altered. The reputation acquired by this edifice, the only one he had then produced in the metropolis, except the University Club-house, Pall Mall East, suffered greatly by the nearly universal outcry raised against his National Gallery. No doubt he had many difficulties and adverse circumstances to contend with in that work: cramped by want of space, and thwarted in various ways, he had no little vexation to encounter, and had also to sustain a unanimous opposition against him from the public and the press; but it is difficult to conceive how he could have fallen so far short of his preceding work. Here the dome is a most unfortunate feature—offensive in outline and mean in character. The portico itself is very far from satisfactory; but here the architect was restricted by being obliged to make use of the ionic from the portico of Carlton House, to which however he did not restore their originally rich entablature; the interior is in almost every respect bad.

While the National Gallery was incurring such ample adverse criticism, the architect entered into the competition for the new houses of parliament, in 1836; but his design did not obtain one of the premiums. The remarks however attached to it by its author in the descriptive catalogue of the designs were in a tone that called attention to it there, and he immediately followed them up by 'An Apology for the Designs of the New Houses of Parliament, marked "Phil. Archimedes;" ' wherein he animadverted very freely, and with no little bitterness of tone, both on the successful design and the conduct of the commissioners. To annoyances and vexations of this kind succeeded an event which made a considerable change for the worse in his profession; for on the death of Sir John Soane, in 1837, he was elected to succeed him as professor of architecture at the Royal Academy, of which he had been made a member in 1834. Yet while his acquirements were of a kind to do honour to the academical chair, it is scarcely probable that he would have proved a very competent instructor. His 'Prolusiones Architectonicæ,' the first part of which (the only one published) appeared just at that time, 1837, did not augur well for his future lectures, being minutely archæological, and withal fanciful. He did not however live to deliver any lectures at the academy, for before the term (two years) allowed to a new professor to prepare himself for them had expired, he himself was no more. His constitution had latterly been greatly impaired by gout, and he had been visibly sinking for some time. He died at Cambridge, August 31st, 1839, on his sixty-first birthday, and was interred in the chapel of Corpus Christi, a part of the new buildings at that college erected by him, and which he considered his best work.

Among other structures by him are:—the Nelson Pillar in Sackville Street, Dublin, 1808; the Nelson Pillar at Yarmouth, 1817; and St. George's Hospital, Hyde Park Corner, which is remarkable for the tetrastyle portico of square columns in the east front. He also erected several private mansions. Besides the literary works already mentioned, he published 'Athenienses, or Remarks on the Buildings and Antiquities of Athens,' in 1816; and 'The Civil Architecture of

Digitized by Google

Vitruvius, containing those books relating to the Public and Private Edifices of the Ancients,' imp. 4to, 1812.

* WILKINSON, SIR JOHN GARDNER, Knight, was born in 1797. He is the son of the Rev. John Wilkinson by the daughter of the Rev. Richard Gardner. He was educated at Harrow School and at Exeter College, Oxford. He afterwards went to Egypt, where he remained twelve years, devoting himself to the study of the antiquities of the country, and making himself acquainted with the languages, manners, and customs of the modern inhabitants. He resided a considerable time in a tomb at Thebes, and employed himself in making accurate surveys of the district, and drawings of the stupendous architectural monuments, and in copying with minute fidelity the sculptures, paintings, hieroglyphics, and other objects of interest there existing. The works which he has since published afford abundant evidence, not only of his assiduity, but of the care and skill with which his investigations were conducted.

In 1828 Mr. Wilkinson published at Malta 'Materia Hieroglyphica,' in four parts; and in London, in 1835, 'Topography of Thebes, and General View of Egypt,' 8vo. In 1836 he published the First Series of his great work on the Ancient Egyptians, 'The Manners and Customs of the Ancient Egyptians, including their Private Life, Government, Laws, Arts, Manufactures, Religion, Agriculture, and Early History, derived from a Comparison of the Paintings, Sculptures, and Monuments, still existing, with the Accounts of Ancient Authors,' 3 vols. 8vo. The Second Series, in 2 vols. 8vo, was published in 1840, in which year he received the honour of knighthood for his labours in literature and archæology.

In 1843, Sir Gardner Wilkinson, having previously been elected F.R.S., M.R.C.L., F.R.G.S., &c., published 'Modern Egypt and Thebes, being a Description of Egypt, including the Information required for Travellers in that Country,' 2 vols. 8vo. The third edition of this 'Ancient Egyptians,' including both series, and illustrated with 600 plates and wood-cuts, was published in 1847, in 5 vols. 8vo. In the same year Mr. Murray published as one of his series of 'Hand-Books,' a 'Hand-Book for Travellers in Egypt, including Descriptions of the Course of the Nile, of the Second Cataract, Alexandria, Cairo, the Pyramids, and Thebes, the Overland Transit to India, the Peninsula of Mount Sinai, the Oases, &c., being a new edition corrected and condensed of 'Modern Egypt and Thebes,' by Sir Gardner Wilkinson,' 12mo. In 1844 Sir Gardner Wilkinson travelled in Dalmatia and Montenegro, and in 1848 published 'Dalmatia and Montenegro; with a Journey to Mostar in Herzegovina, and Remarks on the Slavonic Nations, the History of Dalmatia and Ragusa, the Uscocs, &c.' 2 vols. 8vo. In 1850, he published 'The Architecture of Ancient Egypt, in which the Columns and Capitals, the Orders, and the Temples, are simplified; with Remarks on the Early Progress of Architecture, &c., 8vo, with a large Volume of Plates illustrative of the Subject, and including the various Columns and Details from actual Measurement.' In 1851 he published 'The Fragments of the Hieratic Papyrus at Turin, containing the names of Egyptian Kings, with Remarks,' 8vo, and abridged from his larger work, with the addition of other matter in consequence of his having revisited Egypt, and of other discoveries having been made since the publication of the larger work.

Lord Ripon, in an address to the Royal Society of literature, makes the following remarks on the great work, 'The Ancient Egyptians:'—"Indefatigable in research, full of learning, accurate in facts, Sir Gardner Wilkinson has at the same time treated his subject with the enthusiasm of genius and the liveliness of poetry. He opens to you the temple of their deities, the palace of their sovereign, the field of battle, and the repositories of the dead. He traces for you their early history, he exhibits to you their knowledge of the arts and sciences, the course of their husbandry, and the process of their manufactures; and he introduces you to their private life with a graphic vivacity which makes you at once a judge of the virtues and vices of the Egyptian character, and a partaker as it were of the intimacies of their domestic society." In 1856 he published a volume 'On Colour.'

WILLAERT, ADRIA'NO, a composer much celebrated when musical learning was more cultivated than musical genius, was born at Bruges, in the Netherlands, in the latter part of the 15th century. He first studied the law in the university of Paris, but, as often has happened, the most winning of the muses seduced him from all his pursuit, and thenceforward devoting himself to harmony, he soon became famous for his motets. These procured him the high situation of Maestro di Capella of St. Mark's, Venice, which he held till his decease in September 1563. He was the master of Costanza Porta, of Cipriano Rose, and also of the famous Zarlino, who, in his 'Institutioni Harmoniche,' mentions him in the most eulogistic terms.

WILLAN, ROBERT, was born on the 12th of November 1757, at the Hill, near Sedbergh in Yorkshire, where his father had an extensive practice as a medical man. His parents belonging to the Society of Friends, he was brought up in the principles of this body, and received his early education in the grammar-school of his native place. His progress as a boy in his classical and mathematical studies was very remarkable, and in 1777 he went to Edinburgh well prepared to commence his medical studies. After the usual residence of three years, he graduated in 1780, on which occasion he presented an inaugural dissertation on inflammation of the liver. It was published under the title 'De Jecinoris Inflammatione.' He subsequently came to London for the purpose of further improvement, and was about to settle there, when a relative in a good practice at Darlington died, and Willan became his successor. He remained at Darlington about a year, and returned to London in 1782. During the time he was at Darlington he analysed the sulphureous mineral-spring of Croft, and published the result in an octavo volume, with the title 'Observations on the Sulphur Water at Croft near Darlington.' A second edition of this work was published in 1786. In this work is one of the earliest notices of the peculiar forms of vegetation that inhabit various mineral-springs. He recommends these waters particularly in skin diseases, and perhaps here may be found the germs of inquiry that led to his future labours.

In 1783 the Public Dispensary in Carey-street was opened, and Willan was made physician. In 1785 he was admitted a licentiate of the College of Physicians, on which occasion he addressed to that body some congratulatory Greek verses. In 1786 he commenced a course of lectures at the Dispensary on the principles and practice of medicine; but his success appears to have been small. He was subsequently appointed physician to the Finsbury Dispensary. He was remarkable for the punctuality with which he attended to his public duties, and it said he never sought relaxation by absence from London for thirty years.

From an early period of his professional career Willan seems to have been dissatisfied with the existing nomenclature and classification of cutaneous diseases. He ought by an accurate distinction of external forms to render their classification more simple, and their recognition more certain. In 1789 he had succeeded so far in this object, that a paper which he read before the Medical Society of London obtained for him the Fothergill gold medal of that year. This laid the foundation for the publication of his great work, the 'Description and Treatment of Cutaneous Diseases.' This work was illustrated with coloured plates of the various diseases which were described in the letter-press. The first part was published in London in 1798, and continued in the first order into which he had divided cutaneous diseases, the papulous eruptions of the skin. The second order, scaly diseases of the skin, was published in 1801. He did not live to complete this work. Two more volumes appeared in 1805-7, containing a part of his third order, the rashes, in which the varieties of scarlet fever and measles were treated. A fourth volume, the remainder of the rashes and the Bullæ, or large vesications, was published in 1808. The subject of vaccination having excited great interest, Willan was induced to publish a volume on this subject out of the regular order of his treatise of cutaneous diseases. It was with the title 'On Vaccine Inoculation.' In this work he gave a full account of Jenner's disease the cow-pox, also of the chicken-pox, and of other cutaneous diseases which might be confounded with the vaccine disease. The remaining portions of the work, including the pustulæ, vesiculæ, tubercular, and macular orders, were not published at the completion of Dr. Willan's work; but all the materials having been committed by him to the care of Dr. Bateman, were afterwards published by him in a work entitled 'Delineations of Cutaneous Diseases, exhibiting the characteristic appearances of the principal genera and species comprised in the classification of the late Dr. Willan, completing the whole of the arrangement begun by that author,' London, 1817. By the simple classification which he adopted, and its application to a large number of cases, Willan did more for the advancement of the knowledge of diseases of the skin than any previous writer, and laid the foundation for the successful labours of Bateman, Rayer, and subsequent writers on this subject.

Besides this great work, Willan published several papers in Journals and Transactions, upon various professional subjects. During some part of the time that he was connected with the Dispensary in Carey-street, he published monthly reports of the cases, with observations. These reports contained much valuable information, and those from 1796 to 1800 were published in a separate volume, with the title 'Reports on the Diseases of London,' London, 12mo, 1801. In the early part of his life he published a little volume entitled 'History of the Ministry of Jesus Christ, combined from the Narrative of it in the four Evangelists.' This was published in 1782, and a second edition, with notes and observations, appeared in 1786. Willan was fond of antiquarian pursuits, and read several papers before the Antiquarian Society, of which body he was elected a fellow in 1791. One of the most elaborate of his papers was an essay on the practice of lustration by head-dips, a practice which still continues in some of the northern counties of England. He was elected in 1809 a fellow of the Royal Society.

During the latter part of his life he resigned his public situations. He took an active interest in the establishment of the Fever Hospital, and was made one of its first physicians extraordinary. His health, which was never strong, began to decline in 1810, and his friends persuaded him to embark for Madeira, where he died on the 7th of April 1812.

At the time of his death he was engaged in investigating several points connected with the antiquities of medicine. Among other questions which occupied him was the nature of the *ignis sacer*; the evidences of the prevalence of small-pox, measles, scarlet-fever, and other epidemic

Digitized by Google

diseases amongst the ancients; the history of leprosy, and also of lues. Dr. Willan was a man of retiring and studious habits, devotedly fond of his profession. He had few connexions, and modest manners, so that his course to practice was slow, although it was ample in the end. He was much esteemed by his medical brethren, and beloved by the poor, to whom he was ever kind and attentive. He was a sound observer, and a good practical physician; and his classification of the diseases of the skin must ever be regarded as a great step for the advancement of the knowledge of the forms of disease.

(Bateman, *Memoir of Dr. Willan*, in 32nd number of *Edinburgh Medical and Surgical Journal*).

WILLDENOW, CARL LUDWIG, a botanist, was born in 1765, at Berlin, where his father was an apothecary. He received his early education at Berlin, and studied medicine at Halle, whence he proceeded to Langensalza, for the purpose of studying chemistry in the laboratory of Wiegleb. He took his degree of Doctor of Medicine at Halle; returned to his native city, and, having married, commenced the practice of his profession. He early turned his attention to botany, and before he had graduated he published his Prodromus of the Berlin Flora, with the title 'Prodromus Floræ Berolinensis,' Berlin, 8vo, 1787. On the occasion of his graduating at Halle he presented as his thesis a botanical work, which was entitled 'Tractatus de Achilleis et Tanaceto,' Halle, 8vo, 1789. Shortly after this he published his 'Historia Amaranthorum,' at Zürich, illustrated with 12 plates. Nor did he confine his natural history studies to plants. He took great interest in zoology, and had collected in his museum many specimens of rare animals; and in 1789 he published a catalogue of butterflies in the Mark of Brandenburg, entitled 'Tabellarisches Verzeichniss der in der Churmark Brandenburg enheimischen Schmetterlinge,' Berlin, 8vo. In 1792 he published a memoir of Gleditsch the botanist, and in 1794 his elements of botany, with the title 'Grundries der Kräuter-Kunde,' Berlin, 8vo. This was one of the best elementary works on botany of the day, and was extensively used throughout Germany as a class-book. It was also translated into French and English, and in fact became the model on which most of the subsequent introductions to botany were written. He afterwards published a work of the same nature in 1804, entitled 'An Introduction to the Self-Study of Botany' ('Anleitung zum S-lbst-Studien der Botanik'), but this is an inferior work to the first. In 1792 he published, in folio, a work on the rarer plants, with the title 'Phytographia, seu Descriptio rariorum minus cognitarum Plantarum,' Erlangen. This was followed, in 1796, by a work on the trees and shrubs growing in the open air in the Garden of Berlin, with some account of their culture. Of this work a second edition appeared in 1811.

The successive publication of these works had acquired for Willdenow the reputation of a first-rate botanist, and obtained for him in 1798 the appointment to the chair of Natural History at Berlin. He was also appointed superintendent of the Botanic Garden at Berlin. Previous to his appointment this garden had been much neglected, but by his diligence it became the depository of some of the rarest plants growing in Europe. Willdenow corresponded with most of the botanists of his day, and from Klein he received plants from India; from Humboldt and Bonpland, those of America; from Labillardière, and Smith, those of New Holland; and from Desfontaines, those of Africa. It was thus that, instead of 1200 species he found growing in the garden, he left 6000. He also collected a large herbarium, consisting of above 20,000 species of plants.

The great work of the life of Willdenow was his 'Species Plantarum' of Linnæus. He commenced this work in 1797, and continued publishing it at intervals till 1810, when his health became too enfeebled to enable him to go on. He proceeded as far as the first part of the fifth volume, which contained descriptions of the genera of the natural order Filices. A second part of the fifth volume, including the mosses, was published by Schwægricher in 1830; and Link, in 1824, published two parts of a sixth volume, including the *Fungi*, *Hyphomycetes*, and *Gymnomycetes*. This work was the most important one of its day for systematic botany, as it included descriptions of all species that had been described since the first publication of the 'Species Plantarum' by Linnæus. The first volumes of the book are not so well executed as the last, which is easily accounted for when the different periods in which the author was placed is considered. There are also many manifest errors in the references to works, and in the quotation of synonyms, which diminish its value, and which have produced some very severe criticisms. Every allowance however should be made on account of the magnitude of the work; and, whatever might be its faults, there was nothing to supply its place till the publication of the 'Prodromus' of De Candolle, and where this was incomplete, the aid of the 'Species Plantarum' of Willdenow was still essential. The whole work is arranged according to the Linnæan system. From 1803 to 1809 Willdenow published at intervals descriptions with coloured plates of plants growing in the Botanic Garden at Berlin, under the title 'Hortus Berolinensis,' Berlin, folio. He also contributed many essays and papers to various Journals and Transactions of societies. In 1811 Willdenow went with his family to Paris for the purpose of studying and describing plants in the collections there. He however was able to effect little, on account of his health, and he returned to Berlin, where he died on the 10th of July 1812.

WILLE, JEAN GEORGE, a distinguished engraver, was born at Königsberg, near Giessen, in Hesse, November 5, 1715. He was destined by his parents for business, but from his earliest years he had a passion for drawing and design, and having by his own efforts learnt to engrave, he in his nineteenth year proceeded to Paris where he was employed by Dallé at a low salary. His improvement in his art was very rapid, and he finally attained an almost unrivalled reputation as an engraver of portraits and of figure pieces from the Dutch and Flemish masters. Among his most celebrated prints are the portraits of Marshal Saxe; Massé de Boullongne; Marigny, Count de Saint Florentin, &c., and his genre engravings, such as 'The Knitter,' 'The Reader,' 'An Old Woman of Normandy,' 'The Bullfinch,' 'The Turkey,' 'Satin Gown,' Schalken's 'Family Concert,' 'Wandering Musicians,' and many others from the works of Gerard Dow, Mieris, Dietrich, Terburg, and other masters of the Dutch school. Wille never left Paris after he entered it, and came, though born in Germany, to be generally regarded as a Frenchman. He was admitted a member of the Académie des Beaux-Arts, in 1761; was created a knight of the legion of honour by Napoleon I., and died at Paris on the 8th of August 1808. The engravings of Wille are correct in drawing, brilliant, yet delicate and refined in effect, and convey with admirable precision and feeling the character of the masters from whose works they are executed. Among his pupils were Muller, Schmuser, Bervic, and others who have distinguished themselves in this profession.

WILLEMS, JAN FRANS, the originator of what is called 'the Flemish movement' for the revival of the cultivation of the Dutch language in Belgium, was born at Bouchout, a village near Antwerp, on the 11th of March 1793. The French *sans-culotte* army, under Dumouriez, was at that very time advancing to the siege of Antwerp; early on the day his soldiers entered Bouchout in which that little boy was born, and on hearing the state of affairs politely withdrew from his father's house, observing that the new comer would be the first French citizen of the district, and little foreseeing how effective an opponent he would prove to the influence of France in Flanders. The attachment of Willems to the Flemish language first showed itself at the town of Lierre, where he was sent from the age of twelve to fifteen, to learn singing and playing on the organ, and where he was fortunate enough to meet with a protector and educator in the person of Mr. Reynders, who, by the then cost of public education, was means of schooling in Belgium noted as tutor to his own family, and allowed young Willems to share their instructions in Latin and literature. Lierre was still in possession of some of the 'Rederyk-Kamers,' or Chambers of Rhetoric, the existence of which was one of the most familiar literary features of olden Belgium, and they were in the habit of getting up theatrical entertainments. "The Cecilian Society of the principal church, St. Gummar's, where I every day sang or played the organ, being," says Willems, in a history which he afterwards wrote of the Chambers of Lierre, "in the mind to act some pieces for the benefit of the church, this was the occasion of first bringing me on the stage, and I represented the angel Gabriel bringing the annunciation to the Virgin Mary, in the piece entitled 'The Nativity and Youth of Jesus Christ.' I remember that our manager, Mr. Van den Brande, churchwarden of St. Gummar's, a very pious man, every evening before the curtain was made us kneel down on the stage, and read the Litany of Our Lady that the performance might go off well. It was strange to see how all the characters were mingled together on their knees, and how St. Joseph and Our Lady (N.B., as Our Lady with a beard), Herod, the three Kings, the Jewish Scribes and Pharisees, the angels and the devils all joined in the responses, 'Pray for us, pray for us.' I shall never forget it." The mysteries of the middle ages were thus, it will be seen, flourishing in the 19th century in Belgium, as well as in some more remote corners of Europe.

When Willems was a boy of fourteen at Lierre he wrote a poetical satire in Flemish on the authorities of Bouchout, who had arbitrarily dismissed his father from the post of tax-collector. This and some other proofs of talent led his patron Bergmann to determine not to bury him in the obscurity of his native village but send him to Antwerp, where he was placed as clerk to a notary, and, in 1812, contended victoriously against twenty-six competitors for the prize that was offered for the best poem on the battle of Friedland and the peace of Tilsit. An amateur theatre at Antwerp was the next scene of the early days of his composition 'The Rich Antwerper' and 'Quintin Matsys' met with success both on the stage and in print. The union of Belgium with Holland, which followed the overthrow of the French dominion in both countries in 1814, naturally directed attention to the fact that the so-called Flemish language and the language of Amsterdam are in reality but very slightly differing dialects of one common language which was at one time more cultivated in Flanders and at another in Holland. Willems took the lead in reviving and making popular what it is very singular should ever have been overlooked or forgotten. A spirited poem by him—'Aen de Belgen' (To the Belgians)—published in 1818, exhorted his countrymen not to continue to abandon the language of their fathers, which was also the language of Vondel and Bilderdyk. This poem, which produced a strong sensation, was accompanied by a French translation, which it may be remarked was not a very faithful one. It formed the prelude to Willems's 'Dissertation on the Dutch Language and Literature in connection with the Southern Provinces of the Netherlands' (Ver-

Digitized by Google

handeling over de Nederduytsche Taal- en Letterkunde opgetelyk de Zuydelyke Provincien der Nederlanden), which was commenced in 1819 and completed in 1824. In this work, which extends to two octavo volumes, he aimed at tracing the literary history of Flanders and Brabant from the 13th to the 19th century, showing that literature had flourished in those countries as long as the national language was cultivated, but that it had declined since the religious wars which led to the separation of the North and the South Netherlands, because from that period Latin, and particularly French, had been looked upon as the only instruments of literary cultivation in the Catholic Netherlands, while the use of the native dialect, or of one nearly akin to it, had been abandoned to the Protestants of the Seven United Provinces. There was an outcry against the author of this work on two accounts, one from the antagonists of the union of Belgium with Holland, who stigmatised him as a sycophant of the government because his views tended to recommend the government measure of the introduction of Dutch as the official language, the other from zealous Catholics, who were indignant that a Catholic should maintain the superiority of the literature of the Protestant North to the Catholic South. The dissertation had great value at the time of its appearance as the only attempt at a connected history of Flemish literature, but the additional light since thrown on the subject by the researches of Willems himself and of several others has had the effect of rendering it in some degree obsolete. From the time of its publication Willems was looked upon as the champion of the Flemish cause, which he defended against all enemies and in particular against Van de Weyer [WEYER, VAN DE] in a French pamphlet, entitled 'De la langue Belgique,' which appeared in 1829, only a year before the violent severance of Belgium and Holland.

The revolution of 1830 appeared at first a right to be a mortal blow to the prospects of the Flemish language, and also to the fortunes of its champion. Willems had been placed by the Dutch government in the advantageous post of a receiver of some public dues at Antwerp, where he had been previously appointed by the city as an assistant keeper of archives. He had also been, in conjunction with Van de Weyer, one of the commission for publishing the historical monuments of the South Netherlands. Of these posts he was deprived by the provisional government of Belgium, and sent in an obscure position, with a reduced salary, to the small town of Eeclo, where, on receiving the offers of the Dutch government to place him in a more advantageous position in Holland, he remained for four years. By that time the indignant remonstrances of some of the chief literary men of Belgium, and in particular of his old opponent Van de Weyer, aroused the government to a sense of his unworthy treatment, and in 1835 he was placed at Ghent in a situation similar to that he had occupied at Antwerp. While at Eeclo he had published a modern Flemish version of the celebrated mediæval poem of 'Reynard the Fox,' which he maintained to be of Flemish origin; on the sale of the library of the old Flemish manuscript of the poem at London, in the auction of Richard Heber's library, he applied to the Belgian government to secure it for Belgium, it was purchased at his recommendation for 160*l.*, and in 1836 the poem was printed under his editorship, with a preface, in which he sustained his views with great ability. From this time his life flowed in a course of literary labours and honours. A society was formed at Ghent "for the encouragement of the Low-Dutch language and literature," which published a periodical, the 'Belgian Museum' ('Belgisch Museum), under the editorship of Willems, which was so entirely his work that at his death it suddenly ceased, and was brought to a close, with, for its last article, the life of Willems, from which this notice has chiefly been taken. It extends to ten volumes, and is full of interesting matter. The cultivation of the Flemish language, which he had first promoted, went on increasing. In 1841 a Flemish festival was held at the University of Ghent; two years later a meeting of the "Taelverbond," or "Language Association," at Brussels, at which Willems officiated as president. The movement was too powerful to be withstood by the government. Willems had no longer to fear disgrace for his assertions, and had already, in 1838, been named a knight of the order of Leopold. The Flemish movement still appears to make progress, and the meetings which have been held of distinguished literary men of both the North and South Netherlands appear likely to result in placing the language in Belgium in a higher degree of estimation than it has been for centuries. Willems however was not destined to witness this triumph. He died at Ghent on the 24th of June 1846, after a very brief illness, of an apoplectic attack.

The list of his works given in the 'Belgisch Museum' is forty-three in number, thirty-four in Flemish, five in French, and the remainder in both languages. The most important that have not been already mentioned are his 'Mengelingen van vaderlandschen Inhond' (Miscellanies on National Subjects), Antwerp, 1827-30; the 'Rhymed Chronicle of Jan van Heelu;' the 'Rhymed Chronicle of Brabant, by Jan de Klerk,' edited for the Belgian Historical Commission; and the 'Chronicle of Edward the Third, king of England, written in rhyme in 1347 by Jan de Klerk,' and first published by Willems at Ghent in 1840.

WILLIAM I, King of England, styled THE CONQUEROR (in Latin *Conquestor* or *Conquisitor*, in French *Conquerer*, meaning only, in the language of the feudal system, the *acquirer*), was the illegitimate and only son of Robert, Duke of Normandy, surnamed *Le Diable* (the Devil), and was born in 1027. The vulgar story makes his mother the daughter of Fulbert de Croy, a tanner or skinner of Falaise, whom Robert first saw and became enamoured of as she was dancing with some of her female companions: her name, it is said, was Arlette or Harlotta, whence our English 'harlot.' This is a very suspicious etymology. According to the contemporary historian William of Jumieges (Gemeticensis), the Conqueror's mother was Herleva, the daughter of Fulbert, an officer of Duke Robert's household. After Robert's death she married a Norman knight (*miles*) named Herluin, by whom she had two sons, both of whom made a great figure in their time: Robert, who was created Earl of Mortague in Normandy, and Odo, who became bishop of Bayeux; besides a daughter, who was married to Odo, earl of Albemarle.

During his father's life he was entrusted to the care of Henry I. of France, at whose court he resided. He succeeded to the duchy of Normandy as William II., on the death of his father in 1035. During his minority the nobles several times revolted against his authority, and Normandy was a scene of constant hostility and desolation. Aided however by Henry I., and still more by the mutual jealousies of the nobles, he was enabled to maintain his position till 1047, when in a battle fought at Val des Dunes, between Caen and Argentan, he crushed his most formidable competitor, Guido of Macon, who was supported by nearly the whole body of Norman nobles. By the consequences of this victory, and of subsequent advantages which he obtained over other assailants, the power of William was so far consolidated as to lead him to extend his ambitious views to foreign lands, and especially to the British islands. The commencement of his transactions with England and his acquisition of the crown of that country by the victory of Hastings, or rather Senlac, gained Saturday, 14th of October 1065, have been detailed in the articles EDWARD THE CONFESSOR (ii. 707) and HAROLD II. (iii. 299).

On the death of Harold, Edgar Atheling was unanimously declared king by the Witan assembled in London; and the further management of the war with the Norman invader was committed to the two distinguished brother Earls Edwin and Morcar. But this opposition soon gave way. After a few days a deputation from the nobility, the clergy, and the citizens of London, headed by the two Saxon earls and the rival king, or pretender to the throne, Edgar himself, waited upon William at Berkhamstead, to proffer to him, give him hostages, and made him an offer of the crown; and his coronation took place in Westminster Abbey on the 25th of December, from which day accordingly is dated the commencement of his reign.

The Conqueror's first measures were conciliatory; even in rewarding his Norman followers, we are told, he deprived no Englishman of anything to which he had a just claim: he probably limited his seizures to the land and other property of those who had fallen in arms against him. He respected also the public liberties as well as private rights; the police of the kingdom were maintained in much good order, and the same time the taxes were collected with lenity. But circumstances made it impossible that this state of things should last long. On the one side a numerous people, the old occupants of the country, exasperated by defeat, and on the watch for revenge; on the other, a handful of foreign intruders, flushed with recent victory, and feeling safe in their swords alone lay their safety, as well as their rights: these were elements sure to produce a speedy explosion, even if William's own passions had been much more temperate or more under control than they were. The Saxons and the Normans, it is to be remembered, although belonging to the same great Teutonic race, had been rivals and enemies, as far as their history can be traced, from their first appearance in Western and Northern Europe, and this island, originally wrested by the Saxons from their common prey the Celts, had been their chief battle-field for the last five hundred and fifty years; for the Danes, as they were commonly called, who had made repeated descents upon Britain ever since the beginning of the 9th century, were the same people who, under the name of Northmen, or Normans, had in the beginning of the 10th century effected a settlement in France, and had now, in the middle of the 11th, achieved the conquest of England. It can hardly be doubted, too, from the character of William, that the mildness of his government in the commencement of his reign was only an artful policy adopted to enable him the better to establish his power before carrying out what in that age, and down to a much later date, were held to be the unquestionable rights of conquest. In fact he could not have retained the dominion of the country, if he had not made it furnish lands and lordships for his followers, as well as a crown for himself.

A few months sufficed to make an end of the apparent good agreement between the English and their new rulers. In March 1067, William, as if with no object beyond showing himself in triumph among his old subjects and receiving their congratulations, returned to Normandy, leaving the government of England in the hands of his half-brother, Bishop Odo, upon whom he had conferred the earldom of Kent, and of William Fitz-Osbern, also one of his relations, whom he had created Earl of Hereford. Whether it was that these regents attempted any new exactions or other acts of oppression, or only that advantage was taken of the absence of their master, not many weeks passed before the natives were up in arms in various parts of the country. William returned from Normandy in December. The ensuing two years witnessed a far more severe contest than that

Digitized by Google

which had been decided on the field of Hastings; in fact it was now, in 1068 and 1069, and not in 1066, that the subjugation of the country was really effected, and the Norman dominion established. At first the enemy seemed to be everywhere—nor were the insurgent natives the only power that threatened to dispute with William the possession of the country. His first movement was against the city of Exeter, the head-quarters of the south-western insurrection; but with all his vigour, it was not till after a siege of eighteen days that he forced his way into the place, and even then he engaged that the inhabitants should not be injured either in their lives, their properties, or their municipal privileges. In the quarter of the kingdom, as yet at least, the revolt scarcely seems to have been a Saxon or national movement; it might have grown to that, but at present it was apparently little more than a resistance to some oppressive proceedings, or apprehended proceedings, of the established authorities. William was satisfied therefore with merely putting down the dangerous example, perhaps even at the cost of some concession or compromise; it was necessary that he should not leave such a flame behind him to gather strength while he should be engaged with the more formidable rebellion in the north. That occupied him with little intermission for the whole of the next and a great part of the succeeding year. At the head of it, when it had broken out, were the two earls Edwin and Morcar; they were fallen upon and compelled to make their submission; and for a time the attempt seemed to be crushed. A second rising was speedily put down; and in the course of the succeeding summer of 1069, first the three surviving sons of Harold landed at Plymouth from Ireland, in June, with a fleet of sixty-four sail, and then, in July, Canute the son of Sveno, the Danish king, appeared on the eastern coast at the head of a much more formidable armament: the Irish invaders were driven back after having plundered the adjacent country; the Danes were joined by the newly quieted inhabitants of Yorkshire and Northumberland (themselves mostly of Danish lineage), and a final struggle ensued, which did not indeed last long, and in which William came off victorious, but which left that part of his kingdom literally a desolate wilderness; for, after he had subdued all armed resistance, he found no other way which promised to be effectual in preventing a new insurrection, except actually to depopulate the country by fire and sword, and to reduce a large tract of it to the solitude and silence of death. It is affirmed that above a hundred thousand men, women, and children were destroyed in this terrible operation, and that for nine years thereafter not a patch of tillage was to be seen between York and Durham; nor were the ruins of the buildings that had been thrown down in the reckless devastation cleared away for more than a century.

From this time William ruled his kingdom like a true conqueror. The natives of the country were rapidly deprived of everything, and reduced to a state of complete slavery. All the offices both in the church and the state, from the highest to the lowest, were filled, scarcely an exception, filled with Normans and other foreigners. On any pretence or no pretence at all, by confiscations and unjust decrees, by force or by fraud, nearly every Englishman was in the course of a few years ejected from all proprietorship of the soil, which was not merely, according to the principle of the feudal system, declared as derived from and held of the crown, but was actually seized by the crown, and either retained by it or redistributed at its pleasure. In other respects also feudalism was carried out with a rigour and to an excess that had nowhere else been exemplified. The people were a ground to the earth by various new and oppressive imposts. Fortresses were erected and garrisoned in all the considerable towns to overawe the inhabitants. In short the country was reduced to a vast encampment, in which the only freedom, public or private, that was left was the right of a small number of foreign masters to tyrannise at will over a multitude of toiling and helpless bondsmen.

All this however, and the deluge of blood in which the northern rebellion had been quenched, had the full effect that was intended, of breaking the spirit of the nation, and hushing for the future the very sound of resistance. The only further trouble that William had with the native English was in putting down a band of outlaws, who, headed by the intrepid and skilful Saxon Hereward, for a short time set his power at defiance amid the fens and morasses of the Isle of Ely; and they were rooted out in the course of the year 1071. In 1072 the Conqueror, all England being reduced to subjection, found himself at leisure to lead a great army across the northern border to chastise the Scottish king Malcolm Canmore, who, besides having received and protected Edgar Atheling, whose sister he had married, had two years before, immediately after the suppression of the Northumbrian insurrection, made an inroad into the western parts of York and Durham, and spread almost as much devastation in that quarter as the vengeance of the English king had done along the eastern coast. As William advanced, the inhabitants not only fled before him, but, setting fire to their farm-houses and villages, and carrying away with them everything of value which the flames did not consume, left the land a bare and silent desert. He continued his unresisted march however as far as the Tay, and there, at Abernethy, Malcolm met him, and made his submission, which, according to the English chroniclers, went the length of swearing fealty to him for the kingdom of Scotland, but most probably amounted only to an acknowledgment of him as king of England by the performance of homage for Cumberland and the other English possessions annexed to the Scottish crown. Malcolm moreover is stated to have given hostages for his observance of the peace thus concluded; but no friendship was established between the two; the Scottish king continued to adhere to the cause of his brother-in-law, and a few years after this, in 1079, seizing his opportunity while William was in Normandy, he again crossed the border, and carried fire and sword into Northumberland as far as the Tyne. In the autumn of the following year William sent an army into Scotland under the command of his son Robert; but after advancing only a few miles (to a place which Simeon of Durham calls Eglesebrid), it returned without having effected anything. It was soon after this that the fortress of Newcastle was erected on the Tyne, with the view of checking these Scottish inroads.

Meanwhile, in 1075, during another visit of William to his continental dominions, a number of his Anglo-Norman barons, with Roger, the son of William Fitz-Osbern, and his successor in the earldom of Hereford, at their head, offended, as they professed, at his generally haughty bearing and oppressive government, but chiefly moved, it is probable, by dissatisfaction at the lion's share he had taken to himself in the fruits of their common conquest, had entered into a confederacy to drive him from the throne. But their conspiracy being detected, they were hurried into an armed rising before their plans were mature, and their forces were dispersed by the grand justiciaries William de Warrenne and Richard de Benfail, in a battle fought at a place called, by Ordericus Vitalis, Fagaduna, by which is supposed to be meant Beecham, or Bichem, in Norfolk. On his return home William, the Saxon chronicler states, led a powerful army into Wales, and established his dominion over that country.

The next and only other attempt which was made in William's lifetime to shake his throne, though it wore at first a formidable aspect, came also to nothing, as all the rest had done, defeated partly by his vigilance, promptitude, and energy, partly, as one would say, by his good fortune. In 1085 Canute, the son of Sveno, who had now succeeded his father as king of Denmark, put himself at the head of a great naval armament with the avowed design of asserting his hereditary claim to the English crown. William immediately collected a great army to oppose him, by bringing over multitudes of mercenaries from every part of the continent; but the matter never came to the arbitrement of the sword: the sagacious English king is supposed to have employed his treasure in corrupting the forces of his enemy, as well as in hiring mercenaries for his own defence; be that as it may, one cause or another always prevented Canute from putting to sea; and, after he had lain for more than a month in the port of Haithaby, or Haddeby (on the right bank of the Schle, opposite to Schleswig), a mutiny broke out in the fleet, and the enterprise was abandoned. It was to help him to meet this danger that William revived the odious tax called the Danegelt.

Shortly after his conquest of England, William had promised to his eldest son Robert his hereditary duchy, but afterwards refused to resign it. This led to a contest of arms, in which the father and son are said to have on one occasion encountered without knowing one another, when the old king was wounded in the hand in the unnatural strife. This was while William was besieging the castle of Gerberoi, into which his son had thrown himself. They were eventually reconciled by the intercession of Queen Matilda. It was another quarrel about Normandy however with Philip I. of France, who had taken the part of Robert, that cost William his life. In the summer of 1087 a sarcasm of Philip's on the corpulency of his brother of England, who was then confined to his bed by illness at Rouen (lying-in, as Philip phrased it), infuriated the proud Norman; he swore that at his churching he would set all France in a blaze: as soon as he was able to go on horseback, he collected an army, and made a dash at the city of Mante, formerly belonging to Normandy, which he took, and immediately ordered to be set on fire. This was on the 10th of August. He was enjoying the sight of the conflagration, in which many of the inhabitants perished, when his horse stumbled on some hot embers, and threw him forward on the pommel of the saddle, by which he was so much injured that, being carried back to Rouen, he never again left his bed, but died there on the morning of the 9th of September following, in the fifty-ninth year of his age and twenty-first of his reign.

The principal portion of the laws of the Conqueror that has come down to us consists of a capitulary, which is said to have been drawn up and agreed upon in an assembly of the principal persons of the realm, whom he called together about the year 1070. It is for the most part a selection of the laws previously in force in the Saxon times, according to the last general revision by Canute the Great. It exists both in Latin and in Romance, or old French; and the Latin version, which is preserved in the history attributed to Ingulphus, has usually been reckoned the original; but Sir Francis Palgrave, who has printed both versions from better manuscripts than had been before employed, in his 'Rise and Progress of the English Commonwealth,' Proofs and Illustrations, lxxxviii.-civ., has advanced some reasons for believing that these laws of the Conqueror were most probably originally written in Latin, which was the language in which legal documents were commonly drawn up in England for some ages after this date. The common statement that William attempted to abolish the English tongue and to substitute the French, whether in

Digitized by Google

the courts of law or in the ordinary intercourse of life, rests upon no good authority, and is irreconcilable with well-ascertained facts. The memorable survey of the kingdom completed by order of William in 1086, and known as the *Domesday Book*, need only be mentioned here.

The wife of William the Conqueror was Matilda, daughter of Baldwin V., earl of Flanders, surnamed the Gentle. He married her before he acquired the crown of England, and she died on the 2nd of November 1083. Their children were, Robert, whom his father called Gambaron (Roundlege), and Courthose (Shorthose), who died a prisoner in the castle of Cardiff in 1134; Richard, who was gored to death by a stag in the New Forest; William, by whom he was succeeded on the English throne; Henry, who succeeded William; Cecilia, who became abbess of the monastery of the Holy Trinity at Caen, and died there on the 13th of July 1126; Constance, who was married to Alan, earl of Bretagne and Richmond, but died without issue; Adelina, who died young before the Conquest; Adela, who married Stephen, earl of Blois, by whom she became the mother of Stephen, king of England, and who afterwards took the veil, and died in the nunnery of Marcigny in France about 1137; Gundred, who married William de Warrenne, earl of Surrey, and died in childbed at Castlecrie in Norfolk, May 27, 1085; and Agatha, who was contracted to Alphonso, king of Leon and Castile, but died before her marriage. He had also a natural son, William de Peveril, by Maud, daughter of Ingolric, a Saxon nobleman, who afterwards married Rainulph le Peveril.

WILLIAM II., King of England, surnamed by his French and Norman contemporaries *Le Rouge*, and by the English *The Red* (meaning the Ruddy-faced), which epithets the Latin chroniclers have inaccurately translated not by the proper term *Ruber*, but by *Rufus* (which means the Red-haired), was the second of the three surviving sons of William the Conqueror, and was born in Normandy in 1056. He was educated under the care of the celebrated Lanfranc, whom, in 1063, his father had called from his retirement at Bec to preside over the newly-founded monastery of St. Stephen, at Caen, and whom he afterwards, in 1070, made archbishop of Canterbury. Lanfranc was at the young prince's instructor not only in learning and piety, but in the art of war, and it was from Lanfranc that Rufus received his knighthood. He appears to have been from his boyhood a favourite of his father, who saw reflected in him much more of his own character than in the eldest son, the thoughtless and indolent Robert. In the days before his death, the Conqueror, having assembled around his bed those of his prelates and barons who were with him at Rouen, declared to them that he was willing to leave the dukedom of Normandy, which he had received from his ancestors, to his first-born; but that as for the succession to the kingdom of England, which he had acquired by his own good sword, he would leave that to the decision of God. He added however that he earnestly hoped it might fall to William; and he advised that prince, who was present (Robert was not), to repair immediately to England, giving him at the same time a recommendatory letter to Archbishop Lanfranc. William lost no time in setting out for the sea-coast; he heard of his father having breathed his last as he was about to embark at Wissant, near Calais, having probably waited till he should be able to carry over that news; he concealed it however till he had crossed the Channel, and taken possession of the fortresses of Dover, Pevensey, and Hastings, on pretended orders from his father; he then hastened to Winchester, where he easily induced the master of the royal treasury, William de Pont de l'Arche, to give him his keys; and finally he presented himself before Lanfranc, to whom he had already forwarded his father's letter by a confidential messenger. Lanfranc a few days after assembled a council of the prelates and barons; no one opposed his proposition that William should be declared king, and he was accordingly crowned by the Archbishop of Westminster, on Sunday the 26th of September 1087. The commencement of his reign is dated from that day.

The first business to which the Red King had to address himself was to defend the throne which he had thus mounted against his elder brother. Robert, who at the time of his father's death had been living in exile and poverty at Abbeville in the dominions of the King of France, soon made his appearance at Rouen, and was et once acknowledged as Duke of Normandy. It may be doubted whether he would not have been satisfied with this ancestral inheritance if he had been left to himself; but this, in the circumstances, could hardly be. His chief instigator was Odo, the bishop of Bayeux, who, in the latter years of the preceding reign, had fallen under the displeasure of his half-brother the Conqueror, and was now eager to avenge himself by the dethronement of Rufus. Many others of the English barons also who held possessions in both countries were strongly averse to their separation, as involving the inconveniences and risks of a divided allegiance. Odo is said to have arranged his plans with his friends at the festival of Easter 1088, which was kept by William et Winchester with great state. The insurrection broke out immediately after in all parts of the kingdom. But no efficient assistance came from Robert. William, with prompt sagacity, appealed to his Saxon subjects to stand by him against their hated Norman lords; the castles of Pevensey and Rochester, with Odo in the former, and Eustace, earl of Boulogne, in the latter, were both compelled to surrender; and the rebels, after some further ineffectual resistance, soon everywhere threw down their arms. This unsuccessful attempt to make a revolution in England was speedily followed by a revolt of many of the Norman barons against Duke Robert, who with difficulty was able to maintain his ground, even with the assistance of his brother Henry, to whom in his necessity he parted with about a third of his dominions for the sum of 3000*l.* [HENRY I., vol. iii., 352.] After this civil war had gone on for some time, and Normandy had been reduced to a state of almost complete anarchy, William landed in that country at the head of an army, in January 1091. But the two brothers did not try their strength in battle: Robert applied for protection to his feudal lord, Philip I., king of France, and by his mediation a peace was concluded between them at Caen. By this treaty William released possession of all the Norman fortresses of which his partisans had already made themselves masters, and that was the only actual result of the pacification. It was also indeed agreed that Robert should have compensation in England for the territory thus taken from him, and that, whichever of the two brothers should survive the other should inherit both countries; but these engagements, which cost William nothing at the time of making them, were certainly never looked upon by him, nor perhaps even by Philip (whose desertion of his brother at a critical juncture he had already, some time before this, obtained by a judiciously administered bribe), as good for anything except to serve the purpose of the moment. Robert and William, now converted from enemies into allies, next turned their united arms against their remaining brother, and Henry was in his turn driven into exile. William then returned to England, Robert accompanied him; but he soon found that his promised indemnity was not to be obtained, and he returned to Normandy in disgust. Meanwhile the Red King, in the latter part of 1091, had marched an army into Scotland to avenge himself on Malcolm Canmore, who had taken advantage of his absence in Normandy to invade Northumberland. The two kings settled their differences without fighting, by a treaty, in which Malcolm consented to do homage to William—whether for his kingdom of Scotland or for his English possessions is, as in other like cases, matter of dispute. This Scottish war broke out again two years after; Malcolm made another furious inroad into Northumberland in the autumn of 1093, and, in an attempt to make himself master of Alnwick Castle, he was slain, on the 13th of November in that year, with his eldest son. In the spring of 1094, Rufus again passed over into Normandy, where his brother had once more called to his assistance the French king, and that war between the two remained. Finding it to be unequal against him, Rufus had recourse to his old policy, in the conduct of which however he introduced a new stroke of ingenuity: having sent his commission over to England for an immediate levy of 20,000 men, in which that force had assembled for embarkation at Hastings, an order suddenly came that they should all return home, each man merely leaving behind him, in lieu of his services in the field, the sum of ten shillings, which is supposed to have been what each had received from his lord to maintain him during the campaign; the money thus procured William handed over to Philip, who thereupon withdrew from the war. Rufus was prevented from immediately taking full advantage of this arrangement by being recalled to England by a rising in Wales, and being afterwards further detained by a conspiracy of his Norman subjects in the northern counties, at the head of which was Robert de Mowbray, earl of Northumberland, the most powerful of the barons. He made two campaigns, with little success, against the Welsh in the summers of 1094 and 1095, and was at last obliged to rest satisfied with curbing them, and guarding the western counties from their incursions, by a chain of fortresses; but Mowbray and his adherents were, after a short contest of arms, effectually put down. Soon after this, in 1096, Robert, seized with the new spirit of taking the cross and setting out to fight the infidels in Palestine, freed William from all further trouble about Normandy by characteristically offering to put him in immediate possession of the whole duchy for 10,000*l.* The latter appears to have included a right of redemption by Robert either within or after five years; but the transaction could not have appeared to anybody to amount really to anything else than a complete and final surrender. Such at any rate we may be certain that William determined it should be, whatever were the precise terms of the conveyance. Rufus at this moment had no more money than his needy brother; but by the instrumentality of the famous Ralph Flambard, who ever since the death of Archbishop Lanfranc, in 1089, had been et once his prime minister and chief agent of his oppressions, and the favourite companion of his debaucheries, he soon managed to raise the required sum, not, as an old writer expresses it, by merely fleecing his poor subjects, but rather, as it were, by flaying off their skins. The people of Normandy in general submitted quietly enough to this transference of themselves and their country to a new lord; but the Manceaux, or inhabitants of the district of Maine, Robert's right to which was disputed, rallied around his rival claimant, Helie de la Flèche, and attempted to set William's authority at defiance. This opposition called over the English king once more to the Continent in 1100: he was hunting in the New Forest when a messenger arrived with the news that Helie had surprised the town of Mans, and was besieging the Norman garrison in the castle. Rufus instantly rode to the nearest seaport, and, stepping on board the first vessel he found, directed the crew to hoist sail and begone, asking them, in answer to their entreaties that he would wait till the weather was calmer, if they had ever heard of a king that was drowned. "If I understand," he

Digitized by Google

also said, "the temper of the youth of this land, I shall have plenty of followers." Nevertheless it does not appear that any considerable force accompanied him; but as soon as Helie heard of his arrival, he dismissed his troops and took to flight, upon which William shortly after returned to England. This was the last time that the Red King took the field. On the 2nd of August following he was shot dead by an arrow as he was hunting in the New Forest, by whose hand was never certainly known, although the popular story of the time, dressed up with many striking circumstances by the monkish chroniclers who subsequently recorded it, attributed the act to Sir Walter Tyrrell, otherwise, from his estates in France, called Sir Walter de Poix, a bolt aimed by whom at a deer is said to have been turned aside by a tree, and, striking the king under his raised right arm, to have pierced his heart. The dead body was left unnoticed till a late hour in the evening, when it was found by a poor charcoal-burner, who put it in his cart and so conveyed it to Winchester. William's successor on the English throne was HENRY I.

William Rufus was never married, and the genealogists have not even assigned to him any natural children, notwithstanding all the licentiousness that is attributed to him in general terms. The chroniclers, who were all ecclesiastics, have drawn his character in the darkest colours, and it may be presumed that he is indebted for some portion of the infamy and malediction they have heaped upon him to the manner in which he treated the church, of which he was throughout his reign the systematic oppressor and despoiler. At the same time it is sufficiently clear that neither as a man nor as a king did he much care for restraints of any kind more than those of religion. He was not only dissolute, but rapacious, crafty, unscrupulous, and in the main regardless of everything except his own interests and passions. Rufus, with all his ruffianism, had a taste for some of the true splendours of civilisation, and showed that he was not altogether sunk in sensuality by devoting part of his wealth to architecture, the only one of the fine arts which a king could in his day do much to encourage. Besides other erections of importance, he was the founder of the first Westminster Hall. The commissioners of the Fine Arts, in their Report, dated March 24, 1843, state that "they have reason to believe that the original hall of King William Rufus occupied the same area as the present building."

WILLIAM III., King of England, was born in 1650, and was the posthumous son of William II., prince of Orange, by Mary, daughter of Charles I., king of England. As William II. was the eldest son of the stadtholder, Frederic Henry, who was the youngest son of William the Silent, by Louisa, daughter of the famous Admiral Coligni, William III. was great-grandson of the founder of the Dutch republic, and was also lineally descended, in the female line, from the renowned leader of the Huguenots. Not only had a father's care been denied to the birth and infancy of William III., but his youth was destined to suffer for the errors of his parents. The stadtholder Frederic Henry, unlike his brother Maurice, had administered his office without attempting to violate the liberties of the republic, or giving umbrage to the jealousy of the States: but his son William II., even in the brief career which was cut short by death in his twenty-fourth year, contrived, by his violence and infringement of constitutional rights, to revive public suspicion of the designs of his house against the freedom of the commonwealth; and the party opposed to the Orange interest took advantage of the helplessness of his infant son to prevent his succeeding by election to the dignity of stadtholder, which had become, as it were, hereditary in the line of Nassau. The alliance of that family with the house of Stuart had also excited the jealousy of Cromwell, whose power was now in the ascendant; and, when peace was concluded between the two republics of England and the United Provinces, in 1654, the imperious demand of the protector, that all the States should solemnly engage to exclude the infant prince of Orange and his descendants prospectively from the stadtholdership, was only satisfied by a secret engagement to the same effect, to which Holland, as the leading province of the Union, acceded.

The restoration of the Stuarts to the British throne, in a few years, tended however at once to raise the hopes of the adherents of the house of Orange, and to increase the disquietude of their opponents; and, in 1667, the republicans, headed by the two celebrated brothers, John and Cornelius de Witt, succeeded in inducing the States to pass the "Perpetual Edict," for ever abolishing the office of stadtholder. But the iniquitous aggression of the French king, Louis XIV., upon the republic in 1672, soon put an end to the operation of this edict. However pure might have been the intentions of the De Witts, their measures had left the republic defenceless. Confiding in the friendship of France, and distrusting the best officers of the army, as devoted to the house of Orange, they had, by reductions and neglect, so weakened the land forces of the republic, that resistance to the invaders seemed hopeless. The Orange party were loud in their clamours against the administration of their rivals; and the populace, who had always been favourable to the family of Nassau, were instigated to revolt. Their fury was directed against the De Witts, whom they murdered with horrid barbarity; and the young prince of Orange was tumultuously raised to the proscribed dignity of stadtholder.

William III. was only in the twenty-second year of his age when he was thus suddenly called to the government of a factious and distracted

state, a lawless populace, and a dispirited and disorganised army. With such means was he required to arrest the progress of the victorious king of France at the head of a veteran army of 100,000 men, aided by the best generals of the age, and supported by the whole power both of his own crown and that of England, which the baseness of Charles II. had rendered subservient to his ambition. But, happily for his country and the world, William at once displayed the same characteristics of a firmness and sagacity far beyond his youthful years, which seem to have been the heir-looms of his race, and equally to have distinguished him with his great ancestors William the Silent and Maurice. He indignantly repelled all the efforts of the combined kings of England and France to seduce him from the cause of the republic; and when Buckingham, the favourite of Charles II., asked him if he did not see that the destruction of the commonwealth was inevitable, he replied, "There is one means by which I at least shall be sure not to witness the ruin of my country: I will die in the last ditch." His magnanimous spirit he knew how to infuse also into his despairing countrymen, who cut the dikes of their lands, and resigned the fertile fields, which their ancestors had rescued from the sea, to the ravages of that element, rather than yield them to their invaders. The example of their young leader taught them to spurn the insolent demands of their enemies; and in two short campaigns the French armies, which had overrun the United Provinces, and penetrated almost to the gates of Amsterdam, were entirely driven out of the territory of the republic. In 1674, the young Prince of Orange ventured to bring the veteran Condé to a battle: and, though he suffered for his temerity at Seneffe, he so conducted himself in that defeat as to extort from his illustrious opponent the generous avowal that "he had acted in everything like an old captain, except in venturing his life too much like a young soldier."

During the remainder of the war, which, after a separate peace between England and the States, was protracted with France for four years, and concluded by the peace of Nimeguen in 1678, William continued to display both the highest military and political talents; and, shortly before the close of hostilities, he had effected a personal alliance, which largely influenced the fortunes of his subsequent life. This was his marriage with his cousin Mary, eldest daughter of James, duke of York, and heiress presumptive to the British crown. It is not easy to comprehend the motives of Charles II. to adopt a measure so contrary to his usual policy and inclinations as this union of the princess with William, who, though his nephew, had thwarted his designs and offended his wishes by his maintenance of the republican cause. But dread of the growing discontents of his people, and a belief that the marriage would diminish the jealousies excited by his brother's religion, are supposed to have been motives sufficient to obtain his consent; and he invited or permitted his nephew to pay him the visit in England during which the alliance was concluded.

Neither the Prince of Orange nor Charles II. and his brother probably foresaw all the consequences of this union to the politics of Europe. But no event of William's fortune contributed so essentially to the furtherance of that great design which had become the master passion of his mind—the reduction and infringement of the overgrown power of Louis XIV. and the security of the liberties of the Protestant world; and in whatever degree motives of personal ambition, whether unconsciously to himself or otherwise, were mingled in his plans, he never appears to have suffered any consideration for an instant to interfere with the full pursuit of the great cause to which he had devoted himself. Many circumstances contributed to place him at the head of the general league, provoked by the aggressive power of Louis XIV., in resistance to which his first glory had been won. The revocation of the Edict of Nantes, in 1685, by that monarch, and his persecution of his Protestant subjects, had excited and outraged all their European brethren of the same faith; the insolent pretensions of Louis had given mortal offence to the emperor and king of Spain; the apprehensions which experience had taught the United Provinces to entertain of the projects of this French king naturally rendered the court of their stadtholder the centre of negociation against him; and various causes of hatred and fear enabled William to combine the States themselves and the Protestant princes of Germany, with the two Roman Catholic monarchs of the house of Austria and other powers, in the celebrated league which was concluded against Louis XIV. at Augsburg, in 1687. To the completeness of that great European confederacy nothing was wanting but the accession of England; and this was obtained, in the only manner which the alliance of her new king, James II., with France rendered practicable, by his decided attempt to overthrow the national faith.

From his marriage, William had abstained from taking part in the struggle of parties in England; and though, through his activity in thwarting the schemes of the French king, he had not been able to escape the displeasure of his uncle Charles II., he had lived on decent terms with his father-in-law, and since his accession had proffered him aid in suppressing the rebellion of the Duke of Monmouth. But when he publicly refused to support the repeal of the Test Act, James began both to treat him as an enemy and to take injurious measures against the United Provinces; and, on the other hand, all the English Protestants turned their eyes to the Prince of Orange for the protection of their liberties and faith. On the invitation of the principal

Digitized by Google

persons both of the Whig and Tory parties, William was at length induced to undertake an expedition into England for the restoration of the national rights; and having arranged his preparations with consummate skill, he sailed from Holland with an army of about 14,000 men, composed partly of Dutch troops and partly of English regiments in the service of the States, and landed at Torbay, on the 5th of November 1688.

The landing of William in Torbay was followed, after a few days of hesitation, by an almost total defection of James's English subjects from their allegiance; and with unparalleled ease and rapidity was that memorable and bloodless revolution effected which changed the royal and feudal establishment of these realms into a free state. For once all parties and orders of men in the nation, except a very small minority of Roman Catholics, peaceably concurred in the necessity for a change of government; and when the betrayed and misguided king fled to France, the most opposite principles of passive obedience and popular rights were strained to the same practical conclusion, that James II. had either deserted or forfeited the throne. The all-important question, in what manner the vacant regal seat should be occupied, terminated the short-lived concord of factions. But William, whether moved in part by a mere selfish ambition, or wholly by a better conviction of the public exigencies of the crisis, at once cut short all schemes of the high monarchical party for restricting his functions to a regency, either on behalf of his wife or her infant brother. He declared that, except as king, he would not remain in the country. This decisive language hastened the proceedings of the convention parliament, which William had composed of the peers, the surviving members of the three last Houses of Commons, and the corporation of London; and in the famous Act of Settlement passed by that body, the crown, with constitutional limitations as to its power, was conferred upon the Prince and Princess of Orange, with remainder successively to the issue of the latter, to the Princess Anne and her children, and to the heirs of William by any other wife.

Notwithstanding the ease with which William III. thus acquired the British crown, he was soon compelled to contend in arms for its preservation. In Scotland the cause of James was upheld by the gallant Viscount Dundee, but perished with his fall in the brief moment of victory. In Ireland, the struggle maintained by James's Roman Catholic adherents was more obstinate; but William in person inflicted on them a memorable defeat at the passage of the Boyne in 1690; and the capitulation of Limerick in the following year completed the submission of Ireland. Meanwhile William had the satisfaction of engaging England in the League of Augsburg. The war of that confederacy against Louis XIV., of which the principal conduct was intrusted to William, had indeed little success; for though possessed of considerable military talents, he wanted that good fortune which the ancients numbered among the most indispensable attributes of a great general; and he sustained in the course of this struggle two severe defeats from the French under the Duke of Luxemburg at Steenkirk and Neerwinden. By the peace of Ryswick, which terminated the war in 1697, little more was gained from the French monarch by the allies than the recognition of William III. as king of England.

The possession of that throne had meanwhile given him little happiness. Though almost all the nation had at first concurred in the Revolution of 1688, the Tory and high church party were in general indisposed to the pretensions and person of the new king. The Whigs were still full of jealousy of the royal power; and the cold reserved temper and ungracious manner of William disgusted and alienated the minds of his subjects in general. His most favourite schemes were continually thwarted in parliament; his whole reign was harassed with intrigues of factions and plans of insurrection at home; and his life and throne were assailed from abroad with hostile plots of assassination by the adherents of James II., and with projects of invasion undertaken by Louis XIV. for the restoration of the dethroned king. To add to the distresses of William, he experienced in 1695 a severe domestic calamity in the loss of his queen-consort Mary, to whom he was deeply attached. Her decease, as she left no issue, terminated all claim of her husband to the crown in the eyes of that part of the nation who had been reconciled to his government by the semblance of hereditary right in her participation of the throne. His measures now experienced systematic opposition from all parties: from the Jacobites, as the partisans of the exiled monarch were termed, who of course regarded him as an usurper; from the Tories in general, to whom he was personally obnoxious: and from the Whigs and republicans, who desired in various degrees to lower or annul the royal power. The first use therefore which was made in parliament of the peace of Ryswick was to compel him to reduce the army to an insignificant remnant of guards and garrisons, and to send out of the kingdom the regiments of French Protestant refugees, as well as his own favourite Dutch guards; and these and other mortifications had such an effect upon his mind as to extort from him a passionate expression of his regret that he had interfered in the affairs of a nation at once so ungrateful and so suspicious.

From the annoyances of his position in England, he sought relief by renewing with more ardour than ever his attention to the affairs of Europe, and by pursuing his favourite project for humbling the power of the French king, which the precarious health of Charles II., the childless monarch of Spain, and the pretensions of the house of Bourbon to the inheritance of his dominions, threatened to render more dangerous than ever. To avert these impending evils to the balance of power in Europe, William successively negociated two treaties of partition for the Spanish monarchy, to both of which Louis XIV. was an artful and faithless associate; for when the Spanish king, in indignation that other powers should dismember and distribute his dominions, bequeathed them at his death, in 1700, to Philip duke of Anjou, second son of the dauphin, Louis XIV., in spite of every obligation of treaties, accepted the testament for his grandson.

William III., now in declining health, was sensibly affected by this defeat of all his labours: but he applied himself with his usual energy to form a new league against France; and the insulting conduct of Louis XIV. at this crisis, in giving the son of James II., on the death of that prince, the title of king of England, so exasperated the British nation, that they eagerly seconded William's wishes for a war. But, in the midst of eager preparations for the commencement of hostilities, William's life was suddenly brought to a close. His constitution, originally frail and sickly, had now been completely exhausted by a career of incessant and harassing anxieties. An accidental fall from his horse, by which he broke his collar-bone, gave a fatal shock to his worn-out frame; and he expired at Kensington palace, on the 8th of March 1702, in the fifty-second year of his age.

WILLIAM (HENRY) IV., king of England, was the third son of King George III., and was born at Buckingham House, on the 21st of August 1765. He was placed, with his elder brothers, the Prince of Wales and Prince Frederick (afterwards Duke of York), under the care of Dr. Majendie, till the year 1771, when a separate establishment was formed for the two elder princes, and Prince William was sent at Kew with his younger brother Edward (afterwards Duke of Kent), under the superintendence of Colonel Bude, a native of Switzerland, who afterwards became private secretary to the Duke of York. It having been determined that he should enter the navy, he was, on the 15th of June 1779, rated as a midshipman on board the Prince George, of 98 guns, then bearing the flag of Rear-Admiral Digby at Spithead. The Prince George soon after joined the Channel fleet, under the command of Sir Charles Hardy, and in the end of the year sailed as one of the squadron sent out by Rodney to Gibraltar with supplies for the garrison. On the passage out they fell in, on the 8th of January 1780, with a Spanish fleet of store-ships, under the convoy of seven men-of-war, and took them all, twenty-two in number: the largest man-of-war, the Guipuscuano, of 84 guns, Rodney named the Princess Royal, "in respect to the royal highness by whose presence she had the honour to be taken." In this first affair however in which his royal highness met the enemy there was no fighting. But eight days after a Spanish squadron of fourteen ships of the line, commanded by Don Juan de Langara, encountered off Cadiz, and a sharp though short engagement ensued, which ended in the capture of several of the enemy's ships, and the destruction or dispersion of the rest. Rodney having then proceeded to the Bay of Gibraltar and thrown in his supplies to the garrison, lay there for about three weeks, during which time his royal highness often visited the rock. The Prince George returned in the division under the command of Admiral Digby, who was despatched home with the prizes, and who on the passage fell in with a French convoy bound for the Mauritius, of which he captured three store-ships and a man-of-war; and his royal highness found himself again in England by the beginning of May.

Having made two or three more short cruises in the Prince George, he then went out a second time to Gibraltar in that ship in the spring of 1781, in the fleet commanded by Admiral Darby. After this service Digby, with the Prince George and other ships, proceeded to New York, which he reached on the 24th of August. While his royal highness remained here, which he did throughout the winter, lodging in the town, it appears that a plan was arranged by some of the revolutionary partisans, with the sanction of Washington, for getting possession of his person; but the attempt was never actually made. In the autumn of 1782 he was, at his own request, transferred on board the Warwick, 50 guns, commanded by Captain Elphinstone, afterwards Lord Keith; from which however he was soon after, by the king's orders, removed to the Barfleur, commanded by Sir Samuel Hood. It was while he was in this ship, then lying off Staten Island, that he made his first acquaintance with Nelson, at the time commanding the Albemarle frigate, whose fast friend he ever afterwards continued. In the early part of 1783 Sir Samuel, now Lord Hood, arrived with his fleet at Port Royal, Jamaica; and the prince remained here and at the Havanna, to which he proceeded in the Fortunée frigate, on the sailing of Lord Hood for England, till midsummer, when he returned home in the Fortunée, in which he reached Spithead on the 26th of June. The next two years were spent in a continental tour, on which he set out 31st July 1783, attended by General Bude and Captain Merrick, and in the course of which, after being joined at Hanover by his brother Frederick, now styled Bishop of Osnaburg, he visited Berlin, where the two young English princes saw a great deal of Frederick the Great, Lüneburg, where they spent a winter, Göttingen, Hesse-Cassel, &c., after which Prince William proceeded along through Switzerland to Savoy and Piedmont, and

Digitized by Google

after a visit to Prague, returned to Italy, where he spent the winter. Having come back to England in the spring of 1785, he was, after the usual examination, passed as a lieutenant on the 17th of June, and appointed third lieuteuant of the Hebe frigate, in which he soon after made a voyage round the British Islands. In April 1786, having previously risen to be second lieutenant of the Hebe, he was removed to the Pegasus, and received his commission as captain. In this ship he soon after sailed to Newfeundland, thence to Halifax in Nova Scotia, and thence to Antigua, where he found his friend Nelson commanding on the Leeward Islands station. In June 1787, he was ordered to Jamaica, from which however he soon after took upon him to return without instructions to Halifax; for that irregularity he was ordered to Quebec, but, after staying there a short time, he ventured again to take his own course, and set sail for England. He arrived at Cork in December, but was immediately ordered to repair with his ship to Plymouth; and when he got there he was by another Admiralty order expressly forbidden to quit that port without permission. In the end it was directed that his punishment should be to remain at Plymouth for as long a time as he had absented himself from his station without orders, and then to return to Halifax and the West Indies, and to remain there till he should be ordered home. He went out accordingly in command of the Andromeda, and remained, principally at Jamaica, till the spring of 1789.

The disposition he had shown to break through the ordinary rules of discipline, and the impossibility that was found to exist of imposing an adequate punishment on a prince of the blood, probably led first to the determination that his royal highness's further professional career should be confined to a formal ascent through the successive honours or nominal distinctions of the service. In May 1789, immediately after his return home, he was created duke of Clarence, with the titles of Duke of Clarence and St. Andrews and Earl of Munster; and an income of 12,000*l.* a year was settled upon him by parliament. The next year, after commanding for a short time the Valiant, of 74 guns, on that ship being paid off he was promoted to the rank of rear-admiral of the blue; he was made rear-admiral of the red in 1792, vice-admiral of the blue in 1794, vice-admiral of the red in 1795, admiral of the blue in 1799, and admiral of the fleet in 1801. During all this time however his royal highness remained without employment, living on shore as a private individual with Mrs. Jordan, with whom he had formed a connection in 1791, which lasted for twenty years, and produced a family of five sons and five daughters, of whom the eldest son was created Earl of Munster in 1831, and is since dead. The duke however frequently took part in the debates of the House of Lords, and was at least a tolerably fluent if not a very elegant or logical speaker. One of the subjects in reference to which he particularly distinguished himself was the abolition of the slave-trade, of which he was one of the most determined opponents, not a little to the injury of his popularity for some years. From 1797, when he was appointed to the office of ranger, he usually resided at Bushy Park.

In his general politics the Duke of Clarence attached himself, with his brother the Prince of Wales, from his first entrance upon public life, to the party of the Whig opposition; but he also followed the prince in giving his support to Pitt after the commencement of the war with France in 1793. On the return of Pitt to power however, after the ejection of the Addington administration, in 1804, he again joined the opposition with the prince and the Duke of Sussex; and after Pitt's death he gave a zealous support to the new ministry of Fox and Grenville on all subjects except only the abolition of the slave-trade, which he opposed to the last, in common with all his brothers. The ministry of 1806 raised his parliamentary allowance, and that of each of the other male branches of the royal family, from 12,000*l.* to 18,000*l.* per annum.

Towards the close of the war his royal highness was permitted for a short time to hoist his flag in the Jason to view the military operations going forward on the Dutch coast; and after the peace he performed the holiday services of bringing over the Duchess of Oldenburg to Sheerness, and accompanying Louis XVIII. to the French coast in that ship, and afterwards of bringing the Emperor of Russia and the King of Prussia to England in the Impregnable.

On the 11th of July 1818, the duke was married at Kew to the Princess Adelaide Louisa Theresa Caroline Amelia, (the late Queen-Dowager Adelaide), eldest daughter of George Frederic Charles, duke of Saxe-Meiningen. Their union produced two daughters, one born in March 1819, the other in December 1820, both of whom died in infancy. Upon his marriage 6000*l.* was added by parliament to the income of his royal highness. In 1827, when the death of the Duke of York had placed the Duke of Clarence in the situation of heir presumptive to the throne, a further increase of 3000*l.* was made to his annual allowance, and the sum of 5000*l.* a year was at the same time settled upon the duchess. On the elevation of Mr. Canning to the premiership in April of this year, he placed the duke at the head of the Admiralty, with the office of lord high admiral, but without a seat in the cabinet. This office however his royal highness only held till the following September; and he returned again to private life, till the death of George IV., on Saturday, the 26th of June 1830, raised him to the throne.

The course of events during the reign of William IV. derived its

direction and character from the memorable movements on the continent of Europe with which the accession of a new king in England chanced to be coincident. The publication of the ordinances of Charles X. against the press in France took place exactly a month after King William's accession: then rapidly followed the revolution of the Three Days in Paris, the dethronement of Charles, the transference of the French crown to the Duke of Orleans, and after the lapse of another month the commencement of the similar revolution in Brussels, which terminated in the separation of Holland and Belgium. In England the first symptom of wide-spread popular uneasiness, dissaffection, and tendency to outbreak was given by the dangerous incendiary fires which alarmed the country in the months of September and October. The new parliament, elected since the accession of the new king, met on the 26th of October. On the 7th of November immense excitement was occasioned in the metropolis and elsewhere by the announcement of the resolution come to by the responsible advisers of his majesty that he could not venture with safety to his person to dine on that evening with the lord mayor and corporation of the city of London in Guildhall. This was followed on that day week by the resignation of the Duke of Wellington, Sir Robert Peel, and the other ministers, on Sir Henry Parnell carrying his motion in the House of Commons for referring the settlement of the civil list to a select committee, by a majority of 233 against 204; and within another week the Grey administration was in office under the banner of parliamentary reform. Meanwhile commotion and contention were spreading on the continent. Besides many minor agitation of the same kind, the insurrection in Poland broke out in the end of November—an unhappy attempt, which was entirely unsuccessful.

On the 1st of March 1831, Lord John Russell, as the organ of the cabinet, and, as was universally believed, with the concurrence of his majesty, moved in the House of Commons the first reading of the first Reform Bill. On the 22nd of the same month the second reading was carried by a majority of one; or by 302 votes against 301. But on the 20th of April ministers were beaten by 299 against 291 on General Gascoigne's motion for striking out the part of their reform scheme which diminished the number of members of the House of Commons; and two days after parliament was dissolved, with the avowed design of ascertaining by a new election the sense of the people on the measure which had more than three times been rejected or abandoned. The new parliament assembled on the 14th of June, and the success of the ministerial appeal to the people was shown by the second reading of a second Reform Bill being carried in the House of Commons on the 4th of July by a majority of 367 to 231. It was set till the 19th of September that the bill might come to a vote on the third reading; but that too was carried by a large majority, by 349 against 236. The measure however was defeated in the Upper House on the 3rd of October, by the second reading being negatived by a majority of 199 to 158. On the 20th parliament was prorogued.

A new session commenced on the 6th of December; and on the 12th Lord John Russell introduced the third Reform Bill, the second reading of which was carried on the 17th by a majority of 324 against 162. But the friends of the measure had not become more numerous, it was evident that its opponents were growing weary of the contest, and were hopeless of ultimately averting it. On the third reading nevertheless, the vote upon which did not take place till the 19th of March 1832, the opposition mustered again in their former force, and the motion was resisted by 239 against 355. This time the measure was also se far successful in the Lords that the second reading was carried in that House, on the 13th of April, by a majority of 184 against 175. But on the 7th of May ministers were defeated by a majority of 151 to 116 on Lord Lyndhurst's motion for postponing the consideration of the first (or disfranchising) clause of the bill; on which they immediately resigned. A ministerial interregnum of nearly a fortnight's duration ensued; but by the 17th Earl Grey and his friends were again in power: the most stringent methods are understood to have been employed, with the consent of the king, to keep back the refractory peers; and on the 4th of June the Lords passed the bill by a large majority, 106 voting for the motion, and only 22 against it. It received the royal assent, and became law, three days after.

The bringing about of this change thus occupied, almost to the exclusion of all other measures or questions, the first two years of the reign of William. The action of the new machinery of representation then commenced. The parliament which had passed the Reform Bill was dissolved on the 3rd of December; and the first parliament elected under the new system assembled on the 29th of January 1833. The reform of the representation was now followed by the abolition of colonial slavery, the reform of the poor laws, and the reform of the Irish church. At the same time the Reform ministry underwent a succession of changes. First in March 1833, Lord Durham resigned the privy seal from illness; next followed, in the end of May 1834, the retirement of Mr. Stanley (now the Earl of Derby), Sir James Graham, Lord Ripon, and the Duke of Richmond, on an avowed difference with their colleagues: and finally, on the 9th of July, Lord Grey himself and Lord Althorp relinquished office in consequence of a misunderstanding with Mr. O'Connell in regard to

Digitized by Google

the Irish Coercion Bill. Lord Althorp was induced to return after about a week; but the cabinet was undi-nstood by this time to have lost the confidence of the king; and on the 16th of November, shortly after Lord Althorp had been called to the Upper House by the death of his father, Earl Spencer, and it became necessary to make a new arrangement with regard to his office of the chancellorship of the exchequer, his majesty sent for the Duke of Wellington, and directed him to construct a new ministry. On the 8th of December Sir Robert Peel was gazetted as first lord of the treasury, the Duke of Wellington as foreign secretary, and the cabinet was completed by other names belonging to the Conservative or anti-reform party. On the 30th parliament was dissolved.

This arrangement however did not stand long. On the day on which the new House of Commons assembled, the 19th of February 1835, ministers were beaten on the question of the speakership by a majority of ten votes, or by 316 against 306; and on the 24th they were again defeated on the address by 309 against 302. They maintained the struggle for six weeks longer; but at last, upon Lord John Russell carrying a motion against them on the Irish tithe question (the famous appropriation clause) by a majority of 288 to 253, on the 7th of April, they resigned the next day. The king, understood to be now thoroughly hostile to his old friends, in vain attempted a further resistance; by the 18th the Reform party were again in power, with Lord Melbourne as premier. But the Lord Durham, Lord Stanley, Sir James Graham, Lord Ripon, the Duke of Richmond, Earl Grey, and Earl Spencer, who, having all belonged to the original Reform cabinet, had since ceased to hold office, was now added Lord Brougham. Lord Melbourne's administration lasted for the remainder of the reign. Its most important measures were the several municipal reform acts. William IV. died at Windsor, after a short illness, on the morning of the 20th of June 1837. He was succeeded by Queen Victoria.

WILLIAM I. OF ORANGE. (Nassau, House of.)

WILLIAM FREDERICK I., King of the Netherlands, Grand-Duke of Luxemburg, Prince of Orange Nassau, was born at the Hague on the 24th of August 1772. His father, William V., prince of Orange Nassau, hereditary stadtholder, was descended from John the youngest brother of the great William I. of Orange, and died at Brunswick, April 1806. His grandfather William IV., the first hereditary stadtholder of the United Netherlands (from 1743, who died in 1751), had re-united the possessions of the four branches of the line of Nassau—Otto, Hadamar, Siegen, and Dillenberg, with his own branch, that of Dieta. His mother was Frederica Sophia Wilhelmina, daughter of Prince Augustus William of Prussia. In 1783 he made a journey to Germany, and passed some time at the court of his uncle Frederick William I. He afterwards studied for a time at Leyden.

After his marriage, on the 1st of October 1791, to Frederica Louisa Wilhelmina, daughter of Frederick William of Prussia, he, in conjunction with his brother Frederick, subsequently distinguished as a gen-ral, effected considerable improvements in the Dutch army; but many impediments were occasioned by internal dissensions—the patriots, who had been put down in 1787 by a Prussian force, secretly intriguing against the house of Orange. Some of them had taken refuge in France, and on the 1st of February 1793 the National Convention declared war against the stadtholder. Hoping, with the assistance of the patriots, to obtain possession of the rich provinces of Holland, Dumouriez conquered Dutch Brabant, which was however recovered by the hereditary prince, who was commander-in-chief of the Dutch army, which was joined by a body of the allies after the victory of Neerwinden. This victory had been gained over Dumouriez on the 18th of March, by the Austrian field-marshal the Prince of Coburg. The hereditary prince then hindered the French army of the north from penetrating into West Flandres; but on the 13th of September he was attacked in his position between Manim and Werwick with overwhelming force, and obliged to retreat behind the Scheldt. Soon after this the hereditary prince took Landrecies, and then, at the head of a Dutch and Austrian army, drove the enemy beyond the Sambre; but in the great battle of the 16th of June 1794, the French having taken Charleroi by storm and defeated the prince's left wing at Fleurus, he was again obliged by the directions of the Prince of Coburg to retreat. The Austrians retreated before Pichegru and Jourdan behind the Meuse; and the hereditary prince, with his weakened army, had no alternative but to cover the republic in connection with the army of the Duke of York. But the fortresses fell, and the frost enabled the enemy to pass the Waal on the ice, so that Pichegru entered Utrecht on the 17th of January 1795. The party of the patriots favoured the enemy, and the stadtholder was unable to save the republic, forsaken by its allies. His sons had resigned their commands on the 16th of January, and William V., with his family and a few faithful friends, embarked at Scheveningen on the 18th and 19th for England, where the peace of Hampton Court was negotiated him at his residence. The two sons returned to the Continent to arm a body of Dutch emigrants, at the expense of England, which however was dispersed again after the peace of Basel. Prince Frederick then entered the Austrian service, and died at Padua on the 6th of January 1799.

The hereditary prince then went with his family to Berlin, where he expected a favourable change in his position from the diplomatic influence of the Prussian court, then in alliance with France. He acquired some estates in the vicinity of Posen and in Silesia, and when his father made over to him, on the 29th of August 1802, the indemnity in Germany allotted to him by the Recess of the Empire (Fulda, Corvei, Dortmund, Weingarten, and other places), he took up his residence in Fulda, where, in the place of the inefficient university, he established a lyceum, and appropriated the revenues of two suppressed convents to the foundation of a national hospital. After the death of his father he assumed the government of his Nassau hereditary dominions; but as he declined joining the German Confederation of the Rhine he lost the sovereignty of the possessions of the house of Orange, which were obtained by his relations of Nassau-Usingen and Weilburg, and Murat, grand-duke of Berg; while Weingarten fell to Würtemburg. In August 1806 he went to Berlin, where, as commander of a Prussian regiment, he obtained in September the command-in-chief of a division of the Prussian army between Magdeburg and Erfurt. After the fatal battle of Jena he followed Field Marshal Möllendorf to Erfurt, and became a prisoner of war in consequence of the capitulation concluded by Möllendorf; he was allowed however to reside with his consort in Prussia. Napoleon I. declared that he, as well as the Elector of Hesse and the Duke of Brunswick, had forfeited his dominions; and Fulda was forced already, on the 27th of October, to do homage to the French emperor. Corvei, Dortmund, and the county of Spiegelberg were incorporated in 1807 with the kingdom of Westphalia and the grand-duchy of Berg. Even the domains reserved to him in the act of abdication were taken possession of by king and Würtemburg; Bavaria did not do so, and the other princes of the Confederation promised at least to pay to him the net surplus of the revenue. William had gone in the mean time with his consort and family to Danzig. No mention was made of him in the treaty of Tilsit. He remained in the possession of his estates in the grand-duchy of Warsaw, and again lived at Berlin with his family, and devoted himself to literary pursuits. In the war between France and Austria in 1809, William, with the friend of his youth and constant companion, Fagel, joined the army of the Archduke Charles and Duke Frederick in battle of Wagram. He then returned to Berlin, and in 1814 obtained the rank of Austrian field-marshal. Meantime, especially after the battle of Leipzig in 1813, influential men such as Hogendorp, v. d. Duyn, Limburg-Stirum, Hoop, Driel, Senge, and others, were exchanging thesselves at Amsterdam, the Hague, Leyden, Utrecht, and other places, to effect the restoration of the house of Orange. William was at that time in England to concert measures with the British government for the support of the Netherlands. When the victors at Leipzig approached the frontiers of Holland the inhabitants of Amsterdam rose on the 15th of November, and on the 17th the Hague declared for the prince.

The insurrection of Holland created a sensation of alarm in Paris, while the allies hailed it with joy, as an earnest of further success. When Captain Wuttier was sent from the Hague to the head-quarters of the allies at Frankfurt, he met at Munich, on the 22nd of November, the Prussian general Buiow, who being informed of what had passed in Holland, observed that this insurrection would be as advantageous to the allies as a successful campaign. As soon as William the Prussian's confidential agent reached Utrecht; but the army of the Allies, and the volunteers, who were called to arms, occupied the country. William hastened the arming of the people, and appointed a commission to draw up a constitution, which was accepted on the 29th of March 1814 by the deputies of the people, and then sworn to by the prince. He had already taken possession of his hereditary dominions in Germany, before the end of 1813; hereupon the congress at Vienna decided that Belgium and Liege, together with the Seven United Provinces, should be formed into one kingdom; and on the 16th of March 1815 the prince was proclaimed at the Hague as King of the Netherlands and Duke of Luxemburg. But he was obliged to cede to Prussia his hereditary possessions in Germany for Luxemburg, which after the 22nd of May 1815 belonged to the German Confederation, and which he now raised in May to the rank of a grand-duchy.

The union of so many provinces—the inhabitants of which, though of the same origin, differed very much in manners, customs, and religious doctrines—made a change in the constitution necessary. A commission, consisting of an equal number of Dutch and Belgians, was appointed to make such changes as were requisite. After the king had approved of this draft of a constitution, it was laid before the States-general and deputies from the southern provinces, and finally proclaimed on the 26th of August. In 1814 the king founded the military order of William, and in 1815, after the battle of Waterloo, the civil order of the Belgian Lion, and on the 21st of June 1816 he joined the Holy Alliance. He resided alternately at Brussels and the Hague. On the 17th of May 1816 a Dutch fleet, under Admiral Van der Capellen, joined the British fleet, under Lord Exmouth, in the

Digitized by Google

Bay of Algiers, and compelled the dey to conclude a treaty, by one article of which all Christian slaves were to be restored to liberty.

In the interior of the kingdom a want of harmony between the inhabitants manifested itself on several occasions, which, but for the moderation and firmness of the king, might even then have led to serious dissensions. The unbounded influence of the Roman Catholic clergy, over the belgian classes of the people; the mutual aversion of the Belgians and the Dutch, and the dissatisfaction of the latter with the long residence of the court at Brussels; divisions in the northern provinces between the friends of the old republican system and those of the new monarchical system—all tended to produce discontent, which was kept within bounds only by confidence in the character of the king, and the mild conciliatory principles of his government. In the foreign relations the government, in the main, followed the British system. The marriage of the Prince of Orange to the Grand-Duchess Anne of Russia improved the connection with that empire, but subsequently weakened the interest taken by England in the affairs of the Netherlands. Some differences had arisen with Prussia, with which kingdom a closer union was however caused by the marriage of Prince Frederick to the Princess Louisa, daughter of the King of Prussia, on the 21st of May 1825.

The union with Holland and various commercial treaties with foreign powers had given an extraordinary impulse to the manufactures and commerce of Belgium, especially of the cities of Antwerp and Ghent; but the government could not succeed in blending the Dutch and Belgians into one nation. Their mutual aversion manifested with great acrimony in the church, in the army, and even in the assemblies of the States general. The intolerance of the Roman Catholic clergy, encouraged by the pope, who even excommunicated the Brussels bishops of Tournay, Namur, and Leuwenter, who had taken the oath of allegiance to the king, and the prohibition of the French language in all judicial proceedings, created great irritation in the southern provinces (so that it was found necessary to modify it in several points); and besides these important differences respecting religion and language, there were several financial points in which the interests of the northern and southern provinces clashed; and which, notwithstanding several very beneficial measures, could not hinder the final separation of the two parts of the kingdom.

The union of Belgium and Holland had subsisted for fifteen years. The July revolution of 1830 in France revived the old mutinous pride of the Belgian cities, and a rising of the populace in Brussels, on the 25th of August 1830, commenced the revolution which separated the northern and the southern provinces. In consequence of a second insurrection in Brussels, on the 20th and 26th of September, conflicts arose between the 6000 troops, commanded by Prince Frederick, and the armed insurgents, commanded by foreign officers, which ended in the retreat of the Dutch. Meantime the king, yielding to the desire of a Belgian deputation of the 30th of August, had assembled the States-general at the Hague on the 13th of September, to discuss with them the question of a separate administration, and an alteration of the fundamental law. The two chambers were in favour of it, but the insurgents contended for a total separation, which already existed in fact, when the five powers, Great Britain, France, Austria, Russia, and Prussia, imposed a cessation on both nations, and by the protocol of the 4th of November 1830 recognised the independence of Belgium. King William protested, on the 12th of July 1831, against the eighteen articles presented by the great powers, particularly against that which proclaims the freedom of the Scheld. Holland, with enthusiasm, resolved to have recourse to arms. On the 2nd of August the Prince of Orange, at the head of 70,000 men, crossed the Belgian frontier; Turnhout and other places were taken; one Belgian army was defeated near Hasselt on the 8th of August, and again near Louvain on the 10th; but a French army intervened by forced marches, and the English and French ambassadors at the court of Brussels negociated an armistice, according to which the Prince of Orange evacuated Louvain on the 14th, and his army retired to its position before the war. A treaty in twenty-four articles was then proposed by the London Conference, which was acceded to by Belgium, but rejected by King William. Russia, Prussia, and Austria likewise wished some articles unfavourable to Holland to be modified, but France and England had recourse to measures of coercion. England blockaded the coast of Holland, an embargo was laid on the Dutch ships, and the citadel of Antwerp was taken on the 24th of December 1832, after a memorable siege by a French army of 70,000 men. This did not immediately lead to peace between Holland and Belgium, but a suspension of arms was effected on the 21st of May 1833.

The London Conference resumed its difficult task; many important questions remained to be settled: a wearisome series of protocols ensued; William did his utmost to delay the conclusion of these negociations, in hopes of some turn in his favour, and hostilities between Holland and Belgium were on the eve of recommencing at the end of 1838, and were prevented only by the remonstrances of the Conference. At length, induced chiefly by his financial embarrassments, William gave way, and, on the 4th of February 1839, signed the twenty-seven articles, modified to his disadvantage; and the definitive treaty was concluded on the 19th of April 1839, by the plenipotentiaries of the Netherlands and Belgium, and of the five great powers.

But though Holland was now wholly separated from Belgium, there was great excitement in the Dutch Chambers in 1839. They hoped for favourable financial laws and judicious reforms; instead of which proposals were laid before them for a loan of fifty-six millions of florins. The loan was rejected on the 20th of December, and the budget on the 23rd; a loan of only six millions was granted, and the budget voted for six months only. At the next meeting of the States-General, in March 1840, the king announced modified projects of law to be laid before them; in consequence of which the civil list was fixed at one million and a half of florins; and it was resolved to vote the budget for two years only instead of ten as hitherto. But notwithstanding this endeavour of the government to satisfy the people, the discontent with the king and the ministers increased. The king's passion for the Countess Henrietta d'Oultremont, a Roman Catholic lady, excited the general indignation of the people, so that he declared on the 25th of March 1840, that he renounced his projected union with her. This affair, and the discovery of an extensive conspiracy in Belgium, in which the Dutch appeared to be concerned, and finally the financial difficulties of the state, induced the king solemnly to resign the government on the 7th of October, 1840, into the hands of his son William II. Under the name of Count of Nassau, with an immense private fortune, he fixed his residence at Berlin, where, on the 17th of February 1841, he married the Countess d'Oultremont, and died on the 7th of November 1843. His left his large property to his family, besides a gift of ten millions of florins to the Dutch treasury.

WILLIAM II. (FREDERICK GEORGE LOUIS), King of the Netherlands and Grand Duke of Luxemburg, was born on December 6, 1792, and under the care of his father was educated in the military academy at Berlin, completing his education in the university of Oxford, where he showed much taste for science. His military service early, serving his first campaign with the English army in Spain, and in 1811 accepted the rank of lieutenant-colonel in the Spanish service. His courage and activity procured him the esteem of the Duke of Wellington, who made him his aide-de-camp. At the siege of Ciudad Rodrigo he was among the foremost in the storming party, and at that of Badajoz he entered at the head of an English column, whose retreat he had checked. He also distinguished himself at the battle of Salamanca, and on other occasions, for which he was promoted to be aide de-camp to the king of Great Britain. When in 1814 his father was restored to his kingdom, the Belgians received him gladly as their future sovereign. In 1815 he commanded the army of the Netherlands, and displayed bravery and military skill in the battle of Quatre Bras, and in that of Waterloo, at which he headed his troops, and was wounded in the shoulder. On his recovery he attended the Congress in Paris, and there made the proposal of his union with the Princess Charlotte of England, which however failed, because, it is said, the prince was unwilling to become an English subject only, even if the first; and he shortly afterwards married Anna Paulowna, the sister of the emperor Alexander of Russia. On the breaking out of the revolution in Belgium in 1830, he repaired first to Antwerp and then to Brussels, where his appearance made a great impression. But his endeavours at a reconciliation failed, and at length, overstepping his commission, on October 16 he recognised the independence of Belgium, for which his father afterwards banished him, and he withdrew to England, whither he brought his two eldest sons to be educated. In the following year however he was recalled to the command of the army of Holland in the short war against Belgium, in which he was at first victorious, but was at length compelled to retreat by the armed intervention of France. He was then appointed to the command of the army of observation on the Belgian frontier. On the resignation of his father, on October 7, 1840, he succeeded to the government, in which he showed great regard to economy, and a desire to promote financial improvements, but opposed all constitutional reform. On the breaking out of the revolutionary storm, which spread so widely through Europe in 1848, he was forced to consent to extensive changes, which probably might have been avoided by smaller concessions made earlier. He did not however live long to witness the effect of the alterations, as he died on March 17, 1849.

* WILLIAM III. (ALEXANDER PAUL FREDERICK LOUIS), the son of the preceding, the present king of the Netherlands, was born on February 19, 1817. On his accession to the throne he found himself involved in difficulties from the political party excitement then existing. He chose a ministry from what was called the liberal opposition, and as far as possible promoted economy in the finances. When the pretensions of the popish party had produced a great agitation in 1853, and became so strong as to compel a liberal ministry to resign, because not sufficiently vigorous in their measures against Roman Catholicism, the king wisely confined himself within the limits of the constitution. He changed his ministry in compliance with the desire of the representatives; and a short time brought calmer feelings and renewed peace. William married a daughter of the king of Wirtemberg in 1839, and has several children. [SEPP.]

WILLIAM of MALMESBURY. [MALMESBURY, WILLIAM OF.]

WILLIAM of NEWBURY (in Latin, Gulielmus Neubrigensis) is said to have been born at Bridlington, in 1136, and to have been properly called William Little, whence he sometimes designates himself Parvus, or Petit. His common name he derived from the monastery of Newbury in Yorkshire, of which he was a member.

Digitized by Google

Nothing more is known of his personal history, except that he is said to have been a disappointed candidate for the bishopric of St. Asaph on the death of Geoffrey of Monmouth in 1165, and that he appears to have died about 1220. He is known as the author of a Chronicle of England, which comes down to the year 1189, and is written in better Latin than was then common. It was first printed at Antwerp, in 12mo, in 1567, under the title of 'Gulielmi Neubrigensis Rerum Anglicarum Libri V.' The subsequent editions are, 'Gulielmus Neubrigensis de Rebus Anglicis, cum notis J. Picardi,' Paris, 8vo, 1610; and 'Gulielmi Neubrigensis Historia sive Chronica Rerum Anglicarum, Libris quinque, e codice MS. pervetusto in Bibliotheca Thomæ Seabright, Bar.; Studio atque Industria Th. Hearnii, qui si prater Joan. Picardi annotationes, &c. . . . . suas adjecit,' Oxon., 3 vols. 8vo, 1719. A more accurate edition is that published by the English Historical Society in 1856, in 2 vols 8vo, under the care of Mr. H. C. Hamilton.

WILLIAM of WYKEHAM. [WYKEHAM, WILLIAM OF.]

WILLIAMS, SIR CHARLES HANBURY, was born in 1709, and was the third son of John Hanbury, Esq., a South Sea Director. The name of Williams was assumed in pursuance of the directions of the will of his godfather, Charles Williams, Esq., of Caerleon. He was educated at Eton; after leaving school, he went abroad for some time, and after his return from foreign travel married, in 1732, Lady Frances Coningsby, daughter of Thomas, earl of Coningsby. The year after his marriage he became member for parliament for the county of Monmouth. In parliament he steadily supported Sir Robert Walpole, but took no prominent part as a speaker. He gave the minister however a more effective assistance than that of speeches, by frequent political ballads, which he composed with much skill, and to which he owes a great part of his reputation. In 1739 he was appointed paymaster of the marines; in 1746 he was made a knight of the Bath, and was sent as envoy to Dresden. In 1749 he succeeded Mr. Legge as minister plenipotentiary at Berlin, but in 1751 he returned again to Dresden. He occupied himself in these posts with employments greatly to the satisfaction of his employers, and showed a diligence and regularity in business which surprised those who had known him only as a man of fashion and a wit of private circles. He was sent from Dresden on a very important mission to St. Petersburg, which had for its object to engage the services of Russia in a triple alliance with Austria and England against France. His first efforts at St. Petersburg were attended with remarkable success, but the negociation ultimately failed, and its failure operated severely on Sir C. H. Williams' mind and health. He left St. Petersburg in 1757, in a bad state of health, and with his mind in some degree affected. When he arrived in England he was quite insane. He died on the 2nd of November, 1759. He left two daughters, the elder of whom married William Anne, fourth earl of Essex, and the younger the Hon. Robert Boyle Walsingham, a younger son of the first Earl of Shannon.

Sir Charles Hanbury Williams is known creditably as a poet by his Odes (12mo, 1775). His principal fame during his life was derived from his political squibs, which are of a superior order of excellence, and his talents for conversation. He was the intimate friend of Horace Walpole, Henry Fox, the first Lord Holland, and his brother Stephen Fox, the first Lord Ilchester. He is the author of a paper in the 'World,' No. 37, which describes with much humour the miseries of a great lady's dependent companion.

WILLIAMS, DANIEL, D.D., a Protestant Dissenting minister of the Presbyterian denomination, was born at Wrexham, in Denbighshire, in the year 1644. The disadvantages of his early education were compensated by the natural energy of his mind, and by his diligence. He was one of the first of the new generation who entered the Christian ministry after the ejection of the Nonconformists in 1662; and at the age of nineteen he was regularly admitted as a preacher. His first years in the ministry were passed in preaching in several parts of England, though the times were so unsettled that there was little prospect of his continuing his labours without hazard. At, in those days, more religious liberty was granted by the government in Ireland than in England, Mr. Williams repaired to the sister-country, and unexpectedly received an invitation to become chaplain to the Countess of Meath, which he accepted. Some time afterwards he was settled over a respectable congregation in Wood-street, Dublin. Here he remained nearly twenty years, and filled his station with great credit, being at the same time much respected by the Irish Protestants in general. During his residence in Dublin, he married a lady of an honourable family, with a considerable fortune.

Towards the close of the reign of James II., his warm opposition to Romanism exposed him to some danger; and he consequently came to England in 1687, and settled in London. On occasion of the proposal of an address upon the king's dispensing with the penal laws, Mr. Williams firmly took his stand with the opposition; and his views of the question prevailed in the conference of dissenting ministers. He now became the patron of those Irish Protestants who fled to England from the violence of Tyrconnel; assisting them himself, and procuring for them the sympathy and aid of the public. He rejoiced greatly in the Revolution of 1688; and was often consulted on Irish affairs by King William. In 1700 he went to Ireland on his own private business, and to visit his friends, by whom he was warmly received. Before the period of this visit he had settled as a pastor in Hand Alley, Bishopsgate-street. Here he continued twenty-seven years. He was highly esteemed by Mr. Richard Baxter, on whose death, in 1691, Mr. Williams was chosen to succeed him at the Merchants' Lecture at Pinners' Hall. The Antinomian controversy created parties among the Dissenters connected with this lecture, and Mr. Williams rendered himself obnoxious to those who advocated the tenets of Dr. Crisp, the avowed champion of the Antinomian doctrines. A secession took place, and another Tuesday lecture was established at Salters' Hall. On this occasion, Dr. Bates, Mr. Howe, and Mr. Alsop, who had been among the lecturers at Pinners' Hall, remained with Mr. Williams. When Dr. Crisp's works were reprinted, Mr. Williams, by request, wrote his 'Gospel Truth Stated and Vindicated.' Mr. Stephen Lob having charged this work with Socinianism, an appeal was made on both sides to Dr. Stillingfleet, then Bishop of Worcester, and to Dr. Edwards of Oxford, both these learned persons being regarded as masters in that controversy; and they both acquitted Mr. Williams of the charge. In his 'End of Discord; wherein is demonstrated that no doctrinal controversy remains between the Presbyterian and Congregational Ministers fit to justify longer divisions,' he distinctly states the opinion of the 'Orthodox, the Socinian, and the Antinomian' on the doctrine of the 'satisfaction of Christ,' and he adheres to the views of the first. So great was the heat occasioned by the Antinomian controversy, that we are informed that Mr. Williams's enemies, being foiled in impugning his opinions, endeavoured to misrepresent his character by arraigning his morals. So completely however did he triumph over the charges brought against him, that, after spending eight weeks over the affair, the committee of dissenting ministers in and about the city, reported to sixty of their body, who met April 8th, 1695, "That it is the unanimous opinion of the united ministers that Mr. Williams is entirely clear and innocent of all that was laid to his charge." His whole conduct throughout this painful trial appears much to have increased the attachment of his congregation, as well as his general estimation by the public. Having been now for some time a widower, Mr. Williams married Mrs. Backstead, a widow lady of great excellence, and with a considerable estate.

Diligent as was Mr. Williams in his attention to the pastoral office, he was a man of great public spirit. So long as opposition availed, he strenuously opposed the 'Occasional Conformity Bill,' and the Irish Sacramental Test Act, in the reign of Anne. He was a great promoter of the union between England and Scotland, which took place in 1707. In 1709 he received a diploma of D.D. from the universities of Edinburgh and Glasgow, at the same time with Dr. Oldfield and Dr. Calamy. Anxious for the honour and usefulness of his order, he was very desirous that all the candidates for the dissenting ministry should have at least a part of their education at one or other of the Scottish universities, as they were excluded by the subscription from the English; but his scheme for this purpose did not obtain encouragement. On the accession of George I. in 1714, Dr. Williams had the honour of presenting the address to his majesty, at the head of the London dissenting clergy of the three denominations; and from that time it has been usual for this body to go to court on similar occasions, it being one of the few points of union left on both sides, and by their committees in the royal closet. Dr. Williams's health had by this time visibly declined for a year or two, though he still continued the exercise of his ministry. At length, after a short attack of asthma, he died on the 26th of January 1716, in the seventy-third year of his age, and was buried in Bunhill Fields. In his funeral sermon, Dr. Evans, who had been his co-pastor for eleven years, ascribes to him "a copious invention, a penetrating judgment, a faithful memory, and vigorous affections, which were cultivated by much application to study." His moderation was known by his desire for a comprehension at the Revolution, on condition of a free toleration to such Dissenters as would not be included. His great conscientiousness and his unusual readiness to forgive injuries are also mentioned to his praise. He was accustomed to deliver a lecture to young people on Christmas-day, which was attended by many persons from all parts of the town. His discourses and treatises extend to six volumes 8vo, and have been collected and published at different periods: the last volume consists of Latin versions of several of his treatises, translated for the benefit of foreigners, agreeably to the instructions of his will. He also directed that his treatise entitled 'The Vanity of Childhood and Youth' should be rendered into Welsh for the use of schools, and printed often for the benefit of the poor.

Dr. Williams bequeathed the bulk of his estate to benevolent and useful objects. Having provided for his widow, he left dominions to the Society for the Reformation of Manners; for the education of youth in Dublin; for an itinerant preacher to the native Irish; to the poor of the Wood-street congregation in Dublin, and of that in Hand Alley in London; to the French refugees; to the poor of Shoreditch parish; to assist poor ministers and students; to several ministers' widows; to St. Thomas's Hospital; to the London workhouse; to the Society for promoting Christian Knowledge in Scotland; for the support of two preachers to the Indians; and for the maintenance of charity schools in Wales. He also left estates to the University of Glasgow, which at present furnish six handsome exhibitions to students for the ministry among Protestant dissenters in England, who are to be nominated by his trustees. The last grand bequest in his will was for the establishment of a public library in London. For this purpose

Digitized by Google

he had bought Dr. Bates's collection of books for between 500*l.* and 600*l.* to add to his own. He directed his trustees to erect a suitable building, the site for which was purchased by them in 1727, in Redcross street; and the library was opened in 1729. In 1845 it was removed from Redcross-street to Queen's square, Bloomsbury. Since the library was established, very considerable addit ons have been made to it by legacies, as well as by contributions in money and books. It contains nearly 20,000 volumes. Admission is liberally granted.

WILLIAMS, EDWARD, known by the Bardic name of Iolo Morganwg, was a poet of merit both in Welsh and English. He was born in the parish of Llancarvan in Glamorganshire, about the year 1747. His English poems, lyric and pastoral, in two volumes, published in 1794, present perhaps the most complete list of subscribers that ever was attached to any publication. It begins with the name of the Prince of Wales; it contains those of Mrs. Barbauld, of William Bowles, generalissimo of the Creek nation, Sir William Jones, Miss Hannah More, Lord Orford, Thomas Paine, Samuel Rogers, Miss Anna Seward, John Horne Tooke, Wilberforce, and General Washington. He afterwards published two volumes of Welsh hymns, 'Salmau yr Eglwys yn yr Amalwch.' Williams worked through life at his trade as a stonemason. He lived for some time in London, and was anxious to emigrate to America, but returned to Wales, and lived and died there. He was intimately acquainted with the literature of his country: he was one of the editors of the 'Myvyrian Archaiology,' and he was, in 1820, about to publish a collection of documents illustrative of Welsh history, but seems to have been prevented for want of sufficient support. These documents were collected for publication by the Welsh Manuscript Society, under the editorship of his son, Mr. Taliesin Williams, who published, in 1829, his father's 'Cyfrinach Beirdd Ynys Prydain' (or Secret of the Bards of the Isle of Britain), but we are not aware that they have been published. Iolo died at Flemingstone in Glamorganshire, on the 17th of December 1826; and Southey says, in his Life of Cowper, "It grieves me to think what curious knowledge, and how much of it, has probably perished with poor old Edward Williams." From some letters by him, which were printed during his lifetime in the third volume of the 'Cambrian Register,' it seems that he had written his autobiography, which he had collected an account of Welsh literature during his own time, as well as his opinions of Welsh literature in general.

WILLIAMS, JOHN, lord keeper of the great seal of England, and afterwards archbishop of York, was the son of Edward Williams, of Aber-Conway, in Caernarvonshire in Wales, where he was born on the 25th of March 1582. He received his earliest education at the public school at Ruthin, and entered a student of St. John's, Cambridge, on the 5th of November 1599. Connected with a great Welsh family, he was early looked upon as one likely to bring distinction on the principality. Being largely supplied with money, he distinguished himself at college by a gay life and profuse expenditure. "From a youth and so upward," says his entertaining biographer, Hacket, "he had not a fat to hold money, for he did not only lay out, but scatter, spending all that he had, and somewhat for which he was to be trusted." Yet he was a diligent and ardent student. He had a powerful memory, and great facility in learning languages and applying terms of art. When he afterwards sat on the bench of the Court of Chancery, and lawyers who professed a contempt for his legal acquirements endeavoured to puzzle him with pedantic technicalities, it is recorded that he used to retort, to the mirth of the whole court, by drawing upon his old studies in scholastic logic. He required little rest, and three hours of sleep contented him. "He surrendered up his whole time to dive into the profoundest of learning, in that hath no bottom. He read the best, he heard the best, he conferred with the best, exscribed, committed to memory, disputed: he had some work continually upon the loom. And though he never did so much in this unwearied industry as himself desired, he did far more than all that did highly value him could expect. . . . . All accounted himself a Fellowship was a garland too little for his head, and that he that wont his pace would quickly go farther than St. John's walks." In 1605 he took the degree of Master of Arts. He entered into holy orders in 1609, accepting a small living in Norfolk, and in 1611 he was instituted to the rectory of Grafton Regis in Northamptonshire. In the same year the foundation of his subsequent greatness was laid by his being chosen chaplain to the Lord Chancellor Egerton. He had been able to secure the favourable notice of King James by his conduct in relation to a slight dispute between his majesty and the University of Cambridge; and his new office, "a nest for an eagle," as Hacket calls it, gave him such access to the royal person as enabled him to profit by the favourable impression. Fortunately for himself, he refused the offer of remaining in his chaplaincy under Bacon—perhaps his worldly shrewdness taught him that the soil was undermined beneath.

Having been made one of the chaplains in ordinary to the king, in 1619, he preached before James at Theobalds, and the sermon was printed by command of his majesty, who soon afterwards gave him the rich deanery of Salisbury. But James could only issue his favours through one channel; and desiring to befriend Williams, recommended him to seek the patronage of Buckingham. He adopted the friendly hint, and acted his part in reconciling the conscience of the favourite's Roman Catholic bride to the Church of England. Of a paper, containing the elements of the doctrinal belief of the Church of England, which he drew up on this occasion, twenty copies were printed by order of the king. It was by the advice of Williams that Buckingham adopted the bold project of sacrificing Bacon to save himself from public indignation. The project was more successful than ordinary human foresight could have anticipated, and though it was an unpopular measure to renew the practice of committing the great seal to the hands of an ecclesiastic, the favourite's gratitude overcame his caution. Williams was sworn in as lord keeper on the 10th of July 1621. In the same month he was made bishop of Lincoln, and he was allowed to hold the deanery of Westminster (in which he had been installed in 1620) and the rectory of Walgrave in Northamptonshire (in which he had been instituted in 1611) against ecclesiastical preferments, that, according to Dr. Heylyn's remark, "he was a perfect diocese within himself, as being bishop, dean, prebend, residentiary, and parson, all at once." Bacon was not the only person on whose ruin Williams desired to rise; he was indefatigable in his endeavours to have Archbishop Abbot deprived of his office, on account of his having accidentally shot Lord Zouch's deer-keeper. [ABBOT, GEORGE.] It was part of Williams's policy to employ, with the vast funds which were at his command, a crowd of court spies, whose information he turned to his own advantage. When the Marquis Inoloso, the Spanish ambassador, had succeeded in terrifying James into the belief that he was a prisoner in the hands of Buckingham, Williams was able to inform the favourite of the cause of the king's altered conduct, and to suggest a remedy. Buckingham however appears to have soon entertained a fear that the lord keeper was acquiring too great a share of independent power, and his ruin was resolved on. Laud, whom he was the first to patronise, had also become his deadly enemy, and when he perceived that the keeper was sinking, "he shunned him," says Hacket, "as the old Romans, in their superstition, walked aloof from that soil which was blasted with thunder." Laud's brief but full diary is full of ominous dreams about Williams, in which the wish is father to the thought. In the meantime Buckingham himself sank in the favour of James, and Williams remained lord keeper till the accession of Charles, when, in October 1626, he was deprived of his office. Williams was ordered not to continue in his seat in the House of Lords, but he was not a man to be intimidated. He retained his place on the bench of bishops, and,—incited apparently by personal feelings,—supported, as far as his High Church principles would permit, the popular cause, and exerted himself in promoting the petition of Right. His relentless rival Laud raised against him, in the Star Chamber, a charge of betraying the king's secrets, contrary to his oath as a privy councillor. He was convicted of subornation of perjury in defending himself from this charge,—fined 10,000*l.*, suspended from his office, and condemned to imprisonment during the king's pleasure. At the meeting of the Long Parliament in 1640, he was released, and resumed his seat in the House of Lords. A revolution had now taken place in the court; he was received into favour, and in the following year translated to the archiepiscopal see of York. He retired during the civil war to Aber-Conway in Wales, and held out Conway Castle for the king. He died on the 25th of March 1650. Clarendon with some reason charges Williams with being vain, perfidious, and revengeful. Weldon and others accuse him of having been a corrupt judge; a charge receiving support from the various scale of his expenditure. The same writer charges him with profligacy: but according to Hacket, who would not be likely to mention such a circumstance if it were not true, he accidentally suffered a mutilation in youth, which made continence in his case no virtue. In Collier's 'Annals of the Stage' (ii. 37) the curious circumstance is recorded of Williams's having been charged with having the 'Midsummer Night's Dream' exhibited in his house on Sunday, 27th September 1631. In 1637 he published, in quarto, 'The Holy Table, name and thing, more antiently, properly, and literally used under the New Testament than that of Altar.'

Biography.—Memorial offered to the great learnings of John Williams, D.D. &c.; Phillips, *Life of John Williams*, &c.)

WILLIAMS, REV. JOHN, 'the Apostle of Polynesia,' was born June 29, 1796, at Tottenham, near London. In 1810 he was apprenticed to a furnishing ironmonger in the City Road; and though his indentures exempted him from the more laborious part of his business, young Williams soon displayed an inclination for the workshop rather than the counter, and became so skilful a workman that his master, Mr. Toukin, found it to his interest to employ him in executing orders which required peculiar delicacy and skill. While thus employed he became connected with companions whose irreligious habits threatened to exert a fatal influence upon his character; but on a Sabbath evening early in 1814 he was persuaded by Mrs. Toukin, the wife of his employer, to accompany her to the Tabernacle, Moorfields. He there heard a sermon by the Rev. Timothy East, of Birmingham, which so deeply impressed his mind as to lead to an entire change of life. Before long he united himself with the religious community assembling at the Tabernacle, joined a class of young men formed for the purpose of mutual improvement, and became an active Sunday-school teacher. Missionary operations were then exciting a very lively interest at the Tabernacle, and after much deliberation Williams offered his services to the London Missionary Society, in July 1816, and being accepted, he was allowed to leave Mr. Toukin before the expiration of his apprenticeship.

The islands of the Pacific Ocean, the inhabitants of which had been made known to the British public by the voyages of Captain Cook and others, were selected by the founders of the London Missionary Society as the scene of their earliest labours. For many years the pioneers of the benevolent enterprise laboured with very little success; but before the time when Williams offered himself to the Society, many of the natives had embraced Christianity, and in some islands the cruel rites of idolatry had been entirely abandoned. The most urgent demands for more missionaries were sent to the Society in England, and the directors, recognising the necessity of immediately meeting the requirement, despatched Williams and several other young men with only a few months' preparation for labours which rather called for years of preliminary study. During the short period allowed for this purpose, Williams did not confine himself to literary and theological studies, but also visited manufactories, and made himself acquainted with such processes as he might have to teach in accordance not only with his own views of the missionary work, but also with the instructions received from the Society with which he had connected himself, whose aim it has always been, in subordination to the great design of teaching the gospel, to introduce among the heathen the arts of civilised society.

In October 1816, Williams married Miss Mary Chauner, who proved an invaluable coadjutor in his future labours; and on the 16th of November following, Mr. and Mrs. Williams, in company with several other missionaries, embarked for Sydney, whence after a short stay they proceeded, after calling at New Zealand, to Eimeo, one of the Society Islands, which they reached exactly twelve months after leaving London. Here they remained for some months, Mr. Williams assisting the missionaries previously stationed there, and perfecting himself in the Tahitian language. During this time he also made the iron-work for a small vessel which the missionaries were building for Pomare, king of Tahiti. After a time a party of the missionaries, including Mr. and Mrs. Williams, removed to Huahine, another island of the same group, where they were very gladly received by the natives. The fame of their arrival brought visitors from the surrounding islands, and the urgent solicitations of Tamatoa, king of Raiatea (the Ulitea of Captain Cook), induced Messrs. Williams and Threlkeld to remove to that island, which is the largest and most central of the Society group. Its population was at that time about 1300, but its political influence was far greater than might be expected from its population; it was the seat of the idolatrous system prevalent in those islands, and contained "the archives of their religious legends; the temple and altar of Oro, the Mars and Moloch of the South Seas;" and its principal chiefs received divine honours, as well as civil allegiance and tribute from the neighbouring isles. Upon this interesting island the truths of Christianity had been first proclaimed by the Rev. Mr. Wilson, who, with Pomare and nineteen other Tahitians, had been accidentally driven thither in a storm; and the inhabitants had received their instruction so well as to be exceedingly desirous of obtaining missionaries for themselves. While however the people were willing to adopt Christianity as a national religion, and to give a cordial welcome to its teachers, Mr. Williams found their moral condition to be extremely debased, and their idleness apparently inveterate. They were also so scattered over the island as to render collective instruction almost impossible. It was indeed evident that their habits must be entirely remodelled before the missionaries could hope to prosecute their labours with success. Without neglecting the primary object of his mission, Williams induced the Raiateans to collect themselves to one spot, and to build habitations for themselves, as well as a chapel and school-house. For his own use he erected a comfortable house in the English style, presenting a model to which the natives were encouraged to look both in its structure and conveniences, and in the furniture with which it was adorned; almost everything being done by his own hands. The natives were thus taught not only to appreciate the comforts of civilised life, but to obtain them for themselves, for constructing houses with two or more apartments, with wooden floors, framed walls plastered with coral lime, thatched roofs, well stocked gardens, tables, chairs, sofas, and bedsteads with turned legs, carpets, and hangings. They were also instructed in boat-building, and their diligence and ingenuity were excited by judicious rewards in the form of nails, hinges, and other useful articles which the missionaries procured from England. Proceeding cautiously, first to make the natives feel their necessities, and then to put them in the right way for supplying them, the missionaries were at length gratified by a request to attend a meeting convened by the natives for the purpose of improving their social condition by the establishment of legal marriage. In May 1820, upon the occasion of the opening of a new chapel at Raiatea, at which more than 2400 persons were present, a complete code of laws was established by the votes of the people, and it differed from those previously introduced in other islands of the South Seas in the important point of the introduction of trial by jury. An efficient executive government was also organised, everything being done by the natives, though under the immediate superintendence of their instructors. Being desirous of extending to others the benefits which they enjoyed themselves, the Raiateans formed an auxiliary missionary society, which was supported by liberal donations of such articles as they had learned to prepare for sale; and Mr. Williams laid the foundation of future commercial wealth by teaching the people to cultivate tobacco

and the sugar-cane, and to prepare sugar for the market. With this view he constructed a sugar-mill, the rollers of which were turned in a lathe formed by his own hand.

The benevolence which prompted Williams to such exertions could not rest content within the narrow limits of Raiatea and such places as might be reached from it by occasional boat-voyages. The intelligence received from time to time from other islands gave him a strong desire to extend the peaceful conquest in which he had borne so distinguished a part, and he perceived that nothing was so much wanted for the political advantage of the civilised communities at the mission stations as a market for their produce and a ready means of communication with it. He therefore conceived that if a small ship were permanently engaged in the service of the missionaries, it would tend greatly to facilitate their labours for the civil and religious elevation of the islanders. Although not seconded in these views by the directors of the Society, he was so fully convinced of the importance of the scheme that he determined to undertake a very heavy pecuniary responsibility rather than abandon his project. He therefore visited Sydney about the commencement of 1822, and purchased a schooner of from eighty to ninety tons, called the Endeavour, in the hope that the Society would, upon full explanation of the circumstances, share the responsibility of the purchase. He also made arrangements for promoting the rising commerce of the islands, and returned with several cows, calves, and sheep, presented by Sir Thomas Brisbane, governor of New South Wales, for the use of the chiefs and missionaries. In July 1823, Williams sailed from Raiatea in the Endeavour, for the Hervey Islands, calling at Tahiti on mission-station of Huahine. After which he endeavoured to carry into effect a long-cherished scheme for the discovery of the island of Rarotonga, which was then only known to the missionaries by the report of a few of its natives upon other islands. Failing in his first attempt, he visited Mangaia and some other islands, but at length, as is described in the sixth chapter of his 'Missionary Enterprises,' he discovered the desired island, which is the finest and most populous of the Hervey group. Leaving a native teacher there, with a promise of sending further assistance, the Endeavour shortly returned to Raiatea, whence she soon sailed upon another expedition to Savage and Rimatara. Small as the vessel was for such a purpose, the indefatigable missionary was preparing for a more distant expedition to the Navigators' and other islands, when his projects were suddenly checked and he himself was involved in most painful embarrassments by the intelligence that certain interested merchants had procured the enactment of fiscal regulations by the governor of New South Wales, which greatly impeded the development of trade from the South Sea Islands, and rendered the retention of the Endeavour hopeless. At the same time he received intelligence from England that the directors of the Society disapproved of the steps he had taken with regard to the ship, they having a very commendable jealousy of anything that could, even in appearance, impart a worldly character to their proceedings. He was thus compelled to send the ship, laden with the most marketable produce that he could collect, to Sydney, with orders for the sale of both ship and cargo. Grievous as was the folly this disposition, he did not abandon his favourite design, but only allowed it to remain in abeyance for a time, while he devoted his energies to Raiatea, where it was found necessary, from the frequency of destructive storms, to remove the settlement to the opposite side of the island.

In the autumn of 1825 Rarotonga and other of the Hervey Islands were revisited by the Rev. Mr. Bourne, one of Williams's fellow-labourers, in the Hawaia, a vessel chartered for the purpose by the Society. In December of the same year Williams was joined by Mr. and Mrs. Pitman, who were appointed to occupy the new station at Rarotonga, but remained with him for some months at Raiatea before proceeding to their destination. In April 1827 they obtained a passage to Rarotonga, accompanied by Mr. and Mrs. Williams, who contemplated staying a few months to assist their less experienced friends. What has been already stated in reference to Raiatea will indicate the nature of the labours to be performed in other islands; but here was a new difficulty occasioned by the difference of the Rarotongan dialect from that with which the missionaries were acquainted under the name of the Tahitian, and in which all their books were printed. Having conquered the difficulties of the language so far as to be able to speak and preach to the Rarotongans, Williams next engaged himself in preparing books and translating portions of the Bible into the language, which of course he had to reduce to a written form and a grammatical system. When at length prepared to return to Raiatea, he waited month after month for an opportunity of doing so, and, when there seemed to be no hope of a vessel passing within sight, he determined upon building a ship, notwithstanding his limited knowledge of naval architecture, the total absence of assistance beyond what the natives could render, and the lack of iron and tools, of which he had a very insufficient supply. One of the first steps in this undertaking was the construction of a pair of smith's bellows, to obtain leather for which three of the four goats on the island were killed. It must have proved extremely mortifying to find that when the machine was completed it did not act properly, owing to a little over-skirt in the construction; but the perplexity was abruptly terminated by the entire destruction of everything but the boards by rats, which swarmed at Rarotonga. Undismayed by this mishap, Williams contrived a blowing-machine, which is fully described in his 'Missionary Enterprises,' in which no

Digitized by Google

leather was required. Having no saw, the trees used were split by wedges, and having no steaming apparatus, bent planks were procured by splitting curved trunks. Cordage was manufactured of the bark of the *Aibiscus*; sails were made of native matting; and for oakum were substituted cocoa-nut husk, banana stumps, native cloth, &c. Sheaves were formed of the 'aito,' or iron-wood, by means of a lathe constructed for the purpose, and the pintles of the rudder were made from a piece of a pickaxe, a cooper's adze, and a large hoe. By such contrivances, in the short space of fifteen weeks, was completed a seaworthy vessel about sixty feet long and eighteen feet wide. Supplied with anchors of wood and stone, and with a crew consisting only of natives, Williams first tried his vessel, which he styled the 'Messenger of Peace,' in a voyage of about 170 miles, to Aitutaki, which was accomplished without any more serious casualty than the breaking of the foremast through the inexperience of the native crew; and after a few days the vessel returned to Rarotonga with a valuable cargo of pigs, cocoa-nuts, and oats. Shortly afterwards Mr. and Mrs. Buzacott arrived at Rarotonga, having among their stores a supply of iron, which enabled Mr. Williams to strengthen his ship before sailing for Tahiti, a distance of 600 miles, which he accomplished in safety. Being now fully determined to undertake his long-contemplated voyage to the more westerly islands, Williams immediately set about preparations for it. He however returned to Raiatea, and was actively engaged in that and neighbouring islands for a considerable time before the great expedition could be commenced. On the 24th of May 1830 the Messenger of Peace left Raiatea on this important voyage, for the circumstances of which we must refer to the interesting narrative of the missionary voyager himself, merely stating that after calling at Mangaia, Rarotonga, and other out-stations, the vessel proceeded westward to Savage Island, Tongatabu, Savaii, and many other islands of the Hapai and Samoan or Navigators' groups, after which she returned to Raiatea. Towards the latter end of 1832, after conveying a supply of provisions, horses, asses, and cattle to Rarotonga, Williams again sailed in the Messenger of Peace to the Samoa, after which he returned to Rarotonga, where, with Messrs. Pitman and Buzacott, he completed the Rarotongan version of the New Testament. Having now determined to visit England, he sent the Messenger of Peace to Tahiti, with directions that she should be sold, if a purchaser should offer, and that another vessel should be chartered and sent for him. Not hearing again from Tahiti, he eventually completed a small vessel which had been commenced by an American then at Rarotonga, and in July 1833 sailed in it for Tahiti. The business of the mission required another visit to Rarotonga before he finally embarked for England, but at length, having once more visited Raiatea, he took passage in a homeward bound whaler, and reached London in June 1834. The recital of his adventures rendered him immediately an object of attraction at the numerous missionary meetings at which he took a part; and so great was the desire to hear him in all parts of the kingdom, that his labours at home were little less arduous than they had been in the South Seas.

While however his labours in speaking, preaching, and lecturing were almost incessant, Williams never lost sight of engagements more immediately connected with the welfare of Polynesia. He submitted to the directors of the London Missionary Society, and subsequently to the Christian public, plans for a theological college at Rarotonga, for the education of native missionaries, and of a school at Tahiti, which might both afford superior education to the sons of chiefs, and serve the purpose of a normal school for training native schoolmasters. He laid his manuscript of the New Testament before both the British and Foreign Bible Society, and subsequently superintended the printing of that and several other works for the use of the islanders; and he wrote an account of some of the most important circumstances of his extraordinary career, which appeared in April 1837, under the title of 'A Narrative of Missionary Enterprises in the South Sea Islands, with Remarks upon the Natural History of the Islands, Origin, Languages, Traditions, and Usages of the Inhabitants.' This volume immediately excited the deepest interest, not only among those who had heard the statements of the author, or whose hobbies and connections would naturally lead to its perusal, but also among the dignitaries of the Established Church, men eminent for their scientific attainments, and some of the nobility. The society of the humble-minded dissenting missionary was sought by many who had been accustomed to view such proceedings as those which he had narrated as Utopian and fanatical, and many noble donations were made through him to aid the general objects of the mission, as well as those special objects which the Society preferred leaving under his individual management, such as his cherished project of procuring a missionary ship. Referring to Pratt's 'Memoirs' for many pleasing illustrations of the effect produced by this volume, as well as by Williams's personal appeals, it may be stated that, having submitted to the common council of the city of London his ideas of the importance of the expedition he was about to undertake, in a commercial point of view, that body unanimously voted a sum of 500*l.* towards its support. For this purpose alone about 4000*l.* were subscribed, with which the Camden was purchased, repaired, and fitted out, and on the 11th of April 1838 she sailed from Gravesend, with Mr. and Mrs. Williams and sixteen other missionaries and missionaries' wives, who were to be left at their respective stations.

After a short stay at the Cape of Good Hope, and another at Sydney the Camden made for the Samoa. Williams visited many of the surrounding islands, then sailed to Rarotonga, and subsequently to Tahiti, Raiatea, and others of the Society group, whence the Camden again sailed for Samoa, the devoted missionary hoping at last to carry out his long-cherished design of visiting the islands yet farther westward, where as yet nothing had been done for the instruction of the savages. The expedition was proceeding successfully, and had reached the New Hebrides, when, on the 20th of November 1839, a party from the ship landed at Dillon's Bay, in the island of Erromanga, where the natives, irritated, there is reason to believe, by the barbarities perpetrated by the crew of a vessel that had previously visited the island, attacked them, and murdered Mr. Williams, then in the forty-fourth year of his age, and Mr. Harris, who was intending to become a missionary to the Marquesas. The intelligence of the melancholy event produced the most intense excitement both in the numerous islands where the apostolic labours of Williams had been performed, and in his native country, and the universal esteem which his character had obtained called forth the warmest expressions of respect and regret. Such remains of the body of Williams as could be subsequently procured (the greater portion having been devoured by the cannibals of Erromanga) were interred at Apia, in the island of Upolu. It is most gratifying to know that the benevolent work to which Williams devoted his life has not been checked by his untimely end, but that even upon the very island on which he fell the truths of Christianity have since been received with gladness.

Of the character of Williams it is unnecessary to attempt to form an estimate in this brief notice. To comprehend his self-denying zeal, his unconquerable perseverance in the pursuit of the philanthropic objects of his mission, the universality of his talents as an agent of civilisation, and the unbounded influence which marked his public and private actions, it is necessary to peruse the circumstantial narrative of his 'Missionary Enterprises,' a book replete with interest even to those who do not duly appreciate the motives which actuated him and his coadjutors. Much additional information upon these, as well as more purely personal history, is to be found in the volume of 'Memoirs' published by his friend the Rev. Ebenezer Prout, of Halstead.

WILLIAMS, ROGER, the founder of the state of Rhode Island, was born in Wales in 1599. Educated at Oxford, he was in due time ordained, and having adopted the principles of the Puritans, he determined on separating from the Church of England. To avoid the persecution at that time rife in this country, Williams emigrated, with many others of similar religious views, to New England—then the Puritans' land of promise. He landed at Nantasket, Massachusetts, in December 1631. His fervent and godly piety, and ability in preaching and exhortation, secured him much consideration. He was soon invited by the people of Salem to become assistant to their minister. But he had already promulgated doctrines which the 'court' of magistrates at Boston regarded as dangerous, and they warned the people of Salem that they had been precipitate in their choice, and bade them proceed no further. Williams had already distinctly enunciated the principle—which Bancroft ('Hist. of America,' chap. ix.) declares "he was the first person in modern Christendom to assert clearly"—of universal freedom of conscience, that the right of every person to worship in what manner he pleased, or to refrain from public worship altogether without interference on the part of the civil magistrate. He had besides written a defence of the right of the natives to the soil, which the magistrates also condemned; though on this point he subsequently made an explanation and consented to burn the manuscript, they declared that the matters were not so evil as at first they seemed. To avoid strife, he now retired to Plymouth, where he remained for two years, when, on the death of their minister, the church at Salem chose Williams as his successor. Again the court interposed. Williams refused to accept, and amplified his views of liberty of conscience, frankly declaring when pressed by his opponents, that he held that the magistrate ought not to interfere "even to stop a church from apostacy and heresy," and that the office of the civil magistrate "extends only to the bodies and goods and outward estates of men"—doctrines which the court declared to be opposed to the fundamental laws of the state, and subversive of all good government. The church of Salem was again warned: but Williams, on behalf of the church, issued 'Letters of Admonition,' which were adjudged to be a defiance of the authorities. Salem was disfranchised; and as, on being summoned before the court, he refused to withdraw any of his opinions, Williams was sentenced to banishment as a reviler of magistrates. He obtained permission however, winter being at hand, to remain till the spring; but as he persisted in preaching, and his people flocked to hear him, and it was understood that many had decided on going with him to found a new colony somewhere not very distant, the authorities decided to remove him at once as a dangerous person to England. Hearing of this, he fled into the woods, where, as he says in a passage quoted by Bancroft, "for fourteen weeks he was sorely tost in a bitter season, not knowing what bread or bed did mean." But he had acquired a mastery over the language of the Indians, was sheltered by them, and kindly treated.

As soon as the season allowed, Williams began the foundation of his new colony. At first he pitched on Seekonk, but that was within the patent of Plymouth, and when Governor Winthrop directed him to

Digitized by Google

Narragansett Bay as a spot outside the limits of any English patent, Williams regarded his suggestion as a "voice from God." He landed on Rhode Island with his companions in June 1636, on a spot still marked by tradition, and having purchased the land of the Indians, commenced to plant and build a town, which he called 'Providence,' because, he said, "I desired it might be for a shelter for persons distressed for conscience." Here he was soon joined by others who sympathised with his opinions, and in a year or two 'good people' from England flocked thither in considerable numbers—the fame of the earnestness, self-denial, and piety of the first settlers having quickly spread through the Puritan churches. Williams was the founder, the pastor, and the law-giver of the infant state; but he did not aim to be its ruler. He here carried out to the fullest extent the principles he had so boldly asserted. "He chose," to use the words of Bancroft, "to found a commonwealth in the unmixed form of a pure democracy; where the will of the majority should govern the state—yet only in civil things; God alone was respected as the ruler of conscience." It was the first purely democratic commonwealth in modern times, and, according to Bancroft, "this first system has had its influence on the whole political history of Rhode Island; in no state in the world, not even in the agricultural state of Vermont, has the magistracy so little power, or the representatives of the freemen so much."

With exemplary self-denial, Williams laboured on with his people. New settlements had been formed on the island, and the people, in order to secure themselves from disturbed relations with the government of Massachusetts, resolved to seek a charter of incorporation from the English parliament. Williams was chosen (1643) to negociate the grant. He was treated with marked respect by the Parliament, and a charter incorporating the settlers on Narragansett Bay, with "full power and authority to rule themselves," was readily accorded. Williams was received in triumph on his return to Rhode Island, and when some nine years later an infringement of the charter seemed imminent, he was again despatched to the mother-country to obtain a confirmation of the rights of the colony, in which mission he was entirely successful. He returned to Providence in 1654, where he was elected president of the colony, an office he held for three years.

While maintaining perfect liberty of conscience, Williams was an earnest maintainer of his own religious views. He had himself adopted the tenets of the Baptists, and his later years in life entered into a strenuous controversy with the Quakers. His work—'George Fox digged out of his Burrowes, or an Offer of Disputation on Fourteen Proposals made this last summer, 1672 (so called), unto G. Fox, then present on Rode Island in New England' (by R. Williams). As also how G. Fox ebily departing, the Disputation went on, being managed three days at Newport on Rode Island, and one day at Providence, between John Stubs, John Burnet (Burnyeat), and William Edmundson, on the one part, and R. W. on the other. In which many quotations out of G. Fox and Ed. Burrowe' Book in folio are alleged, with an appendix of some scores of G. F., his simple lame answers to his opposites in that Book, quoted and replied to. By R. W. of Providence in N. E. Boston, printed by John Foster,' small 4to, 1676—and Fox's answer—'A New England Fire-Brand quenched, being an Answer unto a Slanderous Book entitled George Fox digged out of his Burrowes, &c., printed at Boston in the year 1676 by Roger Williams of Providence in New England. Which he dedicateth to the King, with desires that, if the Most High please, Old and New England may flourish when the Pope and Mahomet, Rome and Constantinople, are in their ashes. Of a Dispute upon 14 of his Proposals held and debated betwixt him, the said Roger Williams, on the one part, and John Stubs, William Edmundson, and John Burnyeat on the other, at Providence and Newport in Rode Island, in the year 1672. In which his cavils are refuted, and his reflections reproved.' In two parts. As also an answer to R. W.'s Appendix, &c.; with a Postscript confuting its blasphemous assertions, viz., of the Blood of Christ that was shed, its being corruptible and corrupted; and that Salvation was by a man that was corruptible, &c. Wherunto is added a Catalogue of his Railery, Lies, scorn, and blasphemies; and his Temporising Spirit made manifest. By George Fox and John Burnyeat. Printed in the year 1679'—are works curious in themselves and of interest in the early history of Quakerism. Roger Williams died in Providence in April 1683.

WILLIAMS, SAMUEL, a skilful designer and engraver on wood, was born at Colchester, Essex, on the 23rd of February 1788. The son of parents in humble circumstances, his early desire to become an artist met with little encouragement, and though he taught himself drawing and painting, he was at the usual age apprenticed to a printer in his native town. While serving his apprenticeship however he taught himself etching, and subsequently wood-engraving. So attached had he become to the latter art, that on the expiration of his term of service he determined to adopt it as his calling, and, possessing some skill in design, he found on proceeding to London little difficulty in procuring employment among the publishers of low-priced works. His earliest patron is said by his son ('Athen.' 1853, p. 1261) to have been Mr. Crosby, by whom "a series of 300 cuts was given into the hands of the then untried country artist." Gradually working his way upwards, he eventually took his place among the best designers and wood-engravers of his time. His earlier engravings executed for Whittingham's Novelists and Poets, for Wiffen's 'Tasso,' and the architectural publications of Mr. J. Britton, displayed great freedom and ability—qualities strikingly apparent in his vigorous, characteristic, and original, though occasionally somewhat rude designs made for Hone's 'Every Day Book.' In his later engravings and designs—as those in Howitt's 'Rural Life,' Scrope's 'Days of Salmon-Fishing' and 'Deer-Stalking,' Thomson's 'Seasons,' &c.—he shows much more elaboration and neatness, with an equal evidence of the devoted study of rural life and scenery, but perhaps some loss of power. Throughout life he retained his early ambition of painting in oil, but we are not aware that he executed any works of consequence in that branch of art. He died on the 15th of September 1852. Two of his sons still sustain the reputation of the name of Williams as wood-engravers.

WILLIAMS, OF KARS, LIEUT-GENERAL SIR WILLIAM FENWICK, K.C.B., and M.P. for Calne, is a son of the late Mr. Thomas Williams, Commissary-General and Barrack-Master at Halifax, Nova Scotia, in which country he was born, December 10, 1800. He came to England at an early age, and his family for some generations having been connected with the artillery, he was sent to Woolwich Academy by the late Duke of Kent. He obtained his commission as second lieutenant in the Artillery in 1825, and became first lieutenant in 1827, and captain in 1840. Having served for nine years in Ceylon, he was sent to Turkey, where he received the brevet-rank of Major for his military services. In 1843 he was appointed by the Earl of Aberdeen Commissioner for settling the Turkish and Persian frontiers, a work of much delicacy and difficulty, and which he brought to a conclusion in 1852. During this time he had been selected by General Sir Hussey (afterwards Lord) Vivian as instructor of the Turks in artillery practice, and having taken an active part in the Conferences preceding the treaty of Erzeroum in May 1847, was advanced to the rank of lieutenant-colonel and the companionship of the Bath.

Upon the breaking out of hostilities with Russia in 1854, Lieutenant-Colonel Williams was appointed by the Earl of Clarendon her majesty's Commissioner with the Turkish forces in the East, at the same time he was advanced to the rank of Colonel, and shortly afterwards to that of Brigadier-General. In this trying post, in which he was far from being adequately supported by the British ambassador at Constantinople, he won the approbation of the army abroad and the government at home. The head-quarters which first arrived at Kars near Erzeroum, and though labouring under considerable difficulties, he repulsed with severe slaughter an attack of the Russians under General Mouravieff, September 29, 1855, but not receiving reinforcements in answer to his repeated but fruitless applications to the British ambassador, he was obliged to remain upon the defensive. Accordingly, in conjunction with Colonel Lake and General Kmety, he fortified the city of Kars, whilst Mouravieff besieged it closely on all sides, and it was only after enduring the extremity of suffering and hunger, that he agreed to capitulate. Together with his able assistant, Colonel Lake, General Williams was sent as a prisoner of war to St. Petersburg, where he was treated however with all honour and respect. As soon as the Treaty of Peace had been signed at Paris in March 1856, General Williams returned to England. For his victory at Kars he had already been made a K.C.B.; he was now presented with the freedom of the City of London, and rewarded with a baronetcy, bearing the addition 'of Kars,' and a pension of 1000*l.* a year; next, M.P. for Calne, 1856-59; commander of Woolwich garrison; commander of troops in Canada, and, 1865, governor of Nova Scotia.

WILLIAMSON, SIR JOSEPH, a statesman of the reign of Charles II. was the son of the Rev. Joseph Williamson, rector of Bridekirk in Cumberland. He came up to London, while yet a boy, in the capacity of clerk or secretary to Mr. Richard Tolson, member of parliament for Cockermouth, and, on the recommendation of his patron to Dr. Busby, the head master of Westminster School, he went from his service to that school. His assiduity and talent gained for him a recommendation from Dr. Busby to Dr. Langbaine, the provost of Queen's College, Oxford, by whom he was admitted on the foundation of that college. He took his degree of B.A. in 1653, and immediately after went to France as tutor to a nobleman to whom he was recommended by Dr. Langbaine. He was afterwards elected a fellow of Queen's College, and in 1657 he took his Master of Arts degree.

After the Restoration he was appointed secretary to Sir Edward Nicholas, secretary of state, and on Sir Edward Nicholas being succeeded by Lord Arlington, he became secretary to the latter. He was appointed by Lord Arlington keeper of the State Paper Office in Whitehall. In 1667 he was appointed one of the clerks of the council in ordinary, and received the honour of knighthood. He was one of the plenipotentiaries, together with the Earl of Sunderland and Sir Leoline Jenkins, at the treaty of Cologne. On the 27th of June 1674, he was appointed secretary of state in the room of Lord Arlington, to whom, according to the custom of the time, he paid 6000*l.* in order to succeed him. He was at the same time introduced into the privy council. The period during which Sir Joseph Williamson was secretary of state was one of subservience by Charles II. to the interests of France, with which power he entered into secret alliances, and of fears in the nation of the introduction of popery into England. Sir Joseph Williamson was one of the first victims of the excitement caused by the celebrated Popish plot. He was committed to the Tower by the order of the House of Commons,

Digitized by Google

on the 18th of November 1678, on a charge of granting commissions to Popish officers, but he was released by the king on the same day. On the 9th of February following he resigned the secretaryship of state, and was succeeded by the Earl of Sunderland. In December 1679, he married the baroness Clifton, widow of Henry, Lord O'Brien, and sister and sole heiress to Charles Stuart, duke of Richmond, by whom he acquired large property and the hereditary office of high steward of Greenwich. Sir Joseph Williamson died in 1701, and his wife in the year following. He left 6000*l.* and a valuable collection of heraldic manuscripts and of memoirs relating to his foreign negociations to Queen's College, Oxford: and he left 5000*l.* for the purpose of founding a mathematical school at Rochester, by which town he had been frequently returned to parliament. He had sat also several times for Thetford. In the year 1678 he was elected president of the Royal Society. Sir Joseph Williamson appears to have been a diligent public servant, who, in those times, could not have risen from so humble a beginning to the important situation of secretary of state, without possessing some talents for business or perhaps more for courtiership.

WILLIBROD. [WILLBROD.]

WILLIS, BROWNE, an English antiquary of note, grandson of the still more celebrated Dr. Thomas Willis [WILLIS, THOMAS], and by his mother's side of Robert Browne, of Frampton in Dorsetshire, was born at Blandford in that county, September 14th 1682. After passing through Westminster School, which time he had to have first imbibed a taste for the study of architectural and ecclesiastical antiquities, the neighbouring abbey being his favourite haunt, he entered Christchurch, Oxford, as gentleman-commoner. In 1707 he married Catherine, daughter of Daniel Elliott, of an ancient family, who bore him ten children. This lady died in 1724, when he himself a person of some literary pretension, and was author of a work entitled 'The Established Church of England the Catholick Church,' London, 1718, a performance which her husband appears to have thought very meanly of. In the Society of Antiquaries being revived, 1717-18, he became a member of it, and in 1640 the degree of LL.D. was conferred upon him by the University of Oxford. In the following year he testified his sense of the compliment by presenting to that body his valuable cabinet of English coins; he was also a considerable benefactor to the Bodleian Library, by his donations of manuscripts. Nor did his liberality confine itself to munificence of that kind; for, in 1746, he contributed towards rebuilding Stony Stratford church, and in 1752 gave 200*l.* towards repairing the fine tower of that at Buckingham, for which place he had been returned to parliament nearly half a century before, in 1705. He died at his seat, Whaddon Hall, February 5, 1760. Though Willis had rather a passion for antiquarian researches than the skill and judgment, or even the information, required to attain eminence as an archæologist, there can be little doubt that his publications promoted a taste for antiquarian studies. His greatest and most important work is his 'Survey of the Cathedrals of England,' 3 vols. 4to, with plates, which appeared in 1727, 1730, and 1733. Of his 'Notitia Parliamentaria,' the conclusion was not published till 1750, although the first part had been printed in 1715. His last production was a 'History of the Town of Buckingham,' 4to, 1755.

WILLIS, FRANCIS, was a student of Brazennose College, Oxford, and took holy orders in the year 1740. He was soon after appointed to the living of St. John's, Wapping, and afterwards to Greatford in Lincolnshire. Having a taste for the practice of medicine, he used to prescribe for his poor parishioners, which incensed the medical men in the neighbourhood so much, that in his own defence he obtained the degree of doctor of medicine from Oxford in 1759. His medical and theological studies induced him to take up the subject of insanity, and he was very successful in his treatment. It was on this account that he was called in to take charge of George III., when the king was for the first time deprived of the use of his mental faculties. His treatment was successful in this case, and gained for him a great reputation, in addition to a pension of 1500*l.* per annum for twenty-one years. After curing the king, he was sent for to attend the Queen of Portugal, who was labouring under aberration of mind. He succeeded in restoring her majesty to perfect health, and received for his services 20,000*l.* He kept an establishment for the treatment of the insane at Greatford, in Lincolnshire, where he died on the 5th of December 1807, in the ninetieth year of his age.

Willis has left behind him no work on the subject of insanity, and he would perhaps have found it difficult to explain his own success in the treatment of this disease. He was a man of acute mind, and his treatment seemed rather the result of an instinctive perception of what each individual case required, than of the application of any known principles. His personal influence over his patients was immense, and it is said that his mode of looking at a maniac "would make him sustain more effectually than chains or manacles."

WILLIS, NATHANIEL PARKER, was born January 20, 1807, at Portland, in the State of Maine, North America. His parents removed to Boston during his childhood, and he was educated at Boston, Andover, and at Yale College, which he entered in 1824. He graduated in 1827, and was soon afterwards engaged to edit 'The Legendary' and 'The Token.' In 1828 he established 'The American Monthly Magazine,' which he conducted for two years and a half, when it was merged in 'The New York Mirror.' Mr. Willis then went to Paris, where he was attached to the American legation, and in connection with it travelled in France, Italy, and Greece, and in parts of European Turkey and Asia Minor. He afterwards came to England, where he married, and remained two years. While travelling on the continent and residing in England he had published his 'Pencillings by the Way,' in 'The New York Mirror,' in the form of a series of successive letters, in which, in a light and sketchy style, he described the most interesting of the places which he had visited, and related what he had witnessed and heard in societies to which he had been introduced. Many extracts from these letters were published in the English newspapers, and a severe criticism appeared in the 'Quarterly Review.' He was soon afterwards, as he states, offered 300*l.* for the copyright of the whole, and the 'Pencillings by the Way' were published in London in 1835, in 3 vols. cr. 8vo. In the same year he published 'Inklings of Adventure,' a series of tales and sketches which had originally appeared in the 'London Magazine' under the signature of Philip Slingsby. In 1837 he returned to the United States, and retired to a pleasant spot on the banks of the Susquehanne, where he resided two years, and wrote 'Letters from under a Bridge.' In 1839 he became one of the editors of 'The Corsair,' a literary periodical published in New York. In the autumn of that year he revisited England, and in 1840 published 'Loiterings of Travel,' 3 vols. cr. 8vo, and 'Two Ways of Dying for a Husband,' containing the two plays of 'Tortesa the Usurer,' and 'Bianca Visconti.' In the same year appeared an illustrated edition of his 'Poems.'

In 1843, having returned to New York, Mr. N. P. Willis, in conjunction with Mr. George P. Morris, revived 'The New York Mirror,' which had been discontinued for several years. Mr. Willis withdrew from it in 1844, and after the death of his wife, when he again visited England, and in 1845 published 'Dashes at Life with a Free Pencil,' 3 vols. cr. 8vo, consisting of sketches and stories. On his return to New York he published in 1846 his 'Complete Works,' in one vol. 8vo, containing 800 pages. In October 1846 he married a second time, and settled in New York, where he became again associated with Mr. Morris in conducting 'The Home Journal,' a weekly periodical, chiefly devoted to literature. In 1849 he published 'Rural Letters and other Records of Thought at Leisure,' most of which are re-publications, as are also the series of articles which he published in 1850, under the title of 'People I have met, or Pictures of Society.' In 1851 appeared in London, 'Hurry-Graphs, or Sketches of Scenery, Celebrities, and Society, taken from Life,' cr. 8vo, a series of letters and papers which had been published in 'The Home Journal.'

In the early part of 1852 Mr. Willis, suffering from a pulmonary complaint, made a voyage to the West Indies, for the benefit of his health. On his return to America, he passed through some of the Southern States, and in 1853 published 'A Health-Trip to the Tropics,' 8vo. He then visited Canada, and sojourned some time in the islands of St. Thomas and Martinique. He afterwards travelled in Kentucky and the Southern States, and he works up portions of his memoranda somewhat abruptly to form the latter half of his book, describing his visit to the Mammoth Cave of Kentucky, which extends nine miles under the earth. After a short visits to the island of Cuba and the city of Havana, and his sojourn in the cities of Savannah and New Orleans. The book is written mostly in the form of letters, which were first published in 'The Home Journal.' It is one of the most carefully written as well as the most entertaining of Mr. Willis's productions, presenting accurate as well as picturesque descriptions of social incidents. He has since resided at Idlewild, on the banks of the Hudson, and in 1855 published 'Out-Doors at Idlewild,' consisting of sketches of scenes, manners, and characters, in his usual lively style. In the same year he published 'The Rag Bag, a collection of Ephemera,' which are reprints from 'The Home Journal.'

Mr. Willis's liveliness of style, especially in his later works, lends a charm to the most trifling matters, and when the scenes and incidents are of more value renders his descriptions and narratives very attractive. He has been blamed, and no doubt justly, for disclosing too much of the private habits and conversation of persons into whose society he has been admitted; but this fault, though perhaps not entirely removed from his later writings, has been certainly much lessened. His works have had a large circulation in Great Britain as well as in the United States, but their general character may be said to be ephemeral. [*See* SUPPLEMENT.]

*WILLIS, REV. ROBERT, M.A., F.R.S., F.G.S., one of the founders and ornaments of the present school of science in the University of Cambridge, was born in London in the year 1800, and received his superior education in Caius College, where he graduated as B.A. in 1826, and gained a fellowship, which he subsequently vacated. He early became a fellow of the Cambridge Philosophical Society (in the business and offices of which he has always taken a principal share), and was elected a Fellow of the Royal Society on the 23rd of April 1830. On the decease of Professor the Rev. W. Farish in 1837 Mr. Willis was appointed Jacksonian Professor of Natural and Experimental Philosophy in his university.

Professor Willis has devoted himself to a remarkable combination of select departments in applied natural philosophy mathematically treated:—acoustics and the physics of oral language; the philosophy of mechanism and machinery; and the mathematical and mechanical philosophy of ancient architecture, together with its history, both as

Digitized by Google

to construction and decoration, especially of the peculiar style (from which it seems impossible now to disappropriate the in every way incorrect appellation of Gothic) that was brought to so high a degree of perfection in the ecclesiastical edifices of this country. On account of his eminence in the sciences of construction, he has been made an honorary member of the Institution of Civil Engineers and of the Royal Institute of British Architects.

He communicated papers to the Cambridge Philosophical Society in 1828 and 1829 on the vowel sounds, and on organ-pipes, extending and greatly improving the experimental researches of Kratzenstein and Kempelen; and on the mechanism of the larynx. These were inserted in vols. iii. and iv. of the society's 'Transactions,' and one of the subjects treated in the former paper was afterwards analytically investigated by Mr. Hopkins in a paper in vol. v.

In 1831 he produced an acoustic machine called a Lyophone, by which he showed that the sound given by such instruments as the syren of Cagniard de la Tour and the earlier similar instrument of Robison is caused, not by the periodical interruption of the current of air, but by the close recurrence of the same notes. Being an original member of the British Association for the Advancement of Science, he was requested by the Committee of Mathematical and Physical Science, of which also he was a member, to prepare a Report on the state of our knowledge concerning the phenomena of sound, and the additions which had been recently made to it. Of this subject he accordingly delivered an oral account, illustrated by diagrams and experiments, at the second meeting of the Association (Oxford 1832), but the printed report has not appeared, much to the regret of all who are interested in the science of sound.

Having directed his mind to the philosophy of architecture, in 1832-33 Mr. Willis made a rapid tour through France, Italy, and part of Germany, during which two things particularly attracted his attention—the undeserved neglect with which the Italian Gothic had been treated, and the influence of locality upon each style of the middle age architecture. It also appeared to him, from an examination of buildings belonging to the period of the introduction of the pointed arch, that it was only one of a great number of new forms then introduced into architecture; and further, that the balance of evidence was in favour of the Saracenic origin of these forms, for which they were used by the Saracens, and some of which, on their first employment by European architects, were worked in the Arabian manner. But he found reason to agree with Professor Whewell, that the pointed arch is but one among a vast number of peculiarities which, taken altogether, make up the pointed style; and he has illustrated in the work embodying these observations ('Remarks on the Architecture of the Middle Ages, especially of Italy,' Cambr., 1835), to push this argument still further, by showing that the peculiarities alluded to were in all probability the invention of different countries and ages, and that they were combined in various ways together before they finally arranged themselves (by the insensible operation of these successive combinations upon the minds of the architects, we presume) in that happy order which produced what he terms 'the Complete Gothic.'

In 1836 Mr. Willis explained to the Cambridge Philosophical Society his views respecting the composition of the entablature of Grecian buildings as distinguished from that feature in the architecture of Egypt.

The lectures on mechanism which he delivered for the first time to the University of Cambridge on succeeding to the Jacksonian chair in 1837 were based upon a separation of the principles of motion and force new to British science, but which, after having been indicated by Leupold and Monge in distant succession, had been philosophically developed by Ampère in 1834, and was subsequently adopted in this country by Professor Whewell. Professor Willis, in his 'Principles of Mechanism,' designed for the use of students in the universities, and for engineering students generally, published in 1841, pursues this separation into its practical consequences. By a further refinement in discrimination however in this work, instead of considering a machine to be an instrument by means of which we may change the direction and velocity of a given motion, as had hitherto been done, he has treated it as an instrument by means of which we may produce any relations of motion between two pieces of mechanism. In the preface he intimates the intention of completing his plan of a general work on the science of machinery by applying the considerations of force (in the present volume separated from those of motion), to the combinations of which machinery consists, as well as by describing and investigating those parts of machinery in the action of which forces are essential. This design has not yet been accomplished, partly in consequence, very probably, of the publication of Professor Whewell's 'Mechanics of Engineering,' in which he has adopted Professor Willis's views upon the classification of the modes in which motion is communicated from one piece to another of a machine, adding to them the investigation of the effects of force and resistance; thus carrying out a portion of the plan necessary to complete this arrangement of the science of machinery. In the year 1837 also he exhibited and explained his Tabulocursive engine, the object of which is to transfer to paper any numerical series of magnitudes, so as to exhibit the curve obtained by making those magnitudes a series of ordinates, agreeably to the method which has proved so fruitful in the application of analysis to physics, and led to so wide an extension of graphical methods of exhibiting the results. In the same year Professor Willis read a paper on the important subject of the Teeth of Wheels, to the appropriate sectional meeting of the British Association; and to the corresponding section at the meeting of the following year he explained the Odontograph, an instrument he designed for enabling workmen to find at once the centres from which the two portions of the tooth are to be struck, so that the teeth may work truly together. The investigation of the proper curves to be given to the teeth of wheels had been a favourite occupation with mathematicians of the highest eminence. The geometry of the subject might in fact be considered to be very nearly complete; but its application to the requirements of modern construction appeared to Professor Willis to be susceptible of much improvement. In these communications accordingly, and in a paper published, also in 1838, in the 'Transactions of the Institution of Civil Engineers,' vol. ii., in which the contents of both were embodied, he points out forms possessing properties more general than those which had hitherto been adopted for teeth, as well as some practical methods of tracing readily their outlines, describing and figuring the Odontograph. He incorporated the entire contents of this paper into his subsequent work on the 'Principles of Mechanism,' already noticed, adding to them several original investigations relating to the proportions of the teeth and their least number.

Professor Willis is also the author of the following works and memoirs:—'On the pressure produced on a flat plate when opposed to a stream of air issuing from an orifice in a plane surface,' Trans. Cambr. Phil. Soc., vol. iii.; 'On the construction of the Vaults of the Middle Ages,' and 'On the characteristic Architecture of the Plantagenet Style,' Trans. of the Royal Institute of British Architects, vol. i., part 2, 1842; 'A Description of the Sextry-Barn at Ely, lately demolished,' 1843, in the publications of the Cambridge Antiquarian Society; 'Architectural Nomenclature of the Middle Ages,' publications of the Cambridge Antiquarian Society, No. ix., 1844; 'The Architectural History of Canterbury Cathedral,' Lond., 1845, on which a 'Critical Dissertation' was published by Mr. Charles Sandys in the following year; 'The Architectural History of Winchester Cathedral,' 1845, and that of 'York Cathedral,' 1846, in the Proceedings of the Archæological Institute for those years respectively. All these had been orally delivered at the meetings of the Institute, and illustrated in the edifices themselves. 'On the Conventual Buildings attached to the Cathedral at Canterbury,' and 'Description of the Ancient Plan [preserved in the library] of the Monastery of St. Gall, in the Ninth Century,' both in the 'Archæological Journal,' vols. iv. and v., the latter of which appears a paper by Mr. Edward Smirke, F.S.A., on a passage relating to an important part of the history of St. Stephen's church, Bristol, in Professor Willis's 'Architectural Nomenclature;' 'An Architectural History of the Church of the Holy Sepulchre,' added to the second edition of Williams's 'Holy City,' Lond., 1849.

The oral expositions of special subjects in the branches of science to which he has devoted himself, given by Professor Willis to the Cambridge Philosophical Society, to the members of the Royal Institution at their Friday evening meetings, to those of the Royal Institute of British Architects, and at the meetings of the Archæological Institute, uniting theoretical science of a high order with accurate technical and historical knowledge, have always proved most acceptable to his audiences, especially perhaps those relating to portions of the progress of architecture and to the architectural history of particular edifices, which he has illustrated by pictorial dissected models showing the successive stages of construction of the buildings described. Many of the plates illustrating his works have been engraved from his own drawings, and those accompanying his memoir on vaults exemplify a method he has proposed of indicating to the eye the relative positions as to relief of the elements of their structure applicable to other architectural and engineering subjects. We may trace in his methods of investigation and illustration the influence of those adopted by his predecessor Professor Farish in his lectures, especially of his system of the first principles of machinery, and of the isometrical perspective which he adapted to its graphical representation.

At Cambridge Professor Willis lectures on mechanics, statics, and dynamics, with their practical application to manufactures and the steam-engine, and similar subjects. When the late Sir Henry T. De La Beche constituted the Metropolitan School of Science applied to Mining and the Arts, in its present form, he induced Professor Willis to accept the lectureship on Applied Mechanics. In this capacity he gives an extended course of lectures annually, with examinations, imparting to the students those principles of mechanical science which it has formed the business of his life to mature.

WILLIS, THOMAS, was born at Great Bedwin in Wiltshire, on the 27th of January, 1621. He received his early education at the school of Mr. Sylvester, in the parish of All Saints, Oxford, and in 1636 he was admitted a member of Christ Church. He took his degree of B.A. in 1639, and that of M.A. in 1642. The civil war having broken out, Willis took up arms in defence of Charles. He does not appear however to have been actively engaged, and he turned his attention to medicine, and took his degree of B.M. in 1646. He then commenced practice in Oxford, and, as was the custom of medical men in his day, regularly attended at Abingdon market. He lived in a house opposite Merton College, and being attached to the worship of the episcopal

Digitized by Google

church of England, he opened a room in his house for the performance of divine service according to the ritual of that church. His loyalty and attachment to episcopacy were not unrewarded at the Restoration: he was appointed Sedleian professor of natural philosophy in the university in 1660. He soon after received the degree of M.D. In 1659 he published his first work, entitled 'Diatribæ Duæ; prior agit de Fermentatione, de Febribus altera; his accessit Dissertatio Epistolica de Urinis,' the Hague, 12mo, 1659. In this work he shows himself to be one of the chemical physicians of his day, and a follower of the doctrines of Sylvius de la Boe. Mixed up with a good deal of sound observation, the most absurd views with regard to the nature of medicine and the causes of the phenomena of disease are to be found in this volume. He was much more successful as an anatomist, and in 1664 published his great work on the anatomy of the brain, 'Cerebri Anatome; cui accesat nervorum descriptio et usus,' London, 4to. In this work he gave a new method of dissecting the brain, and a much more accurate account of its anatomy than had been previously done. This book contains the germs of those modern views of the physiology of the brain which are adopted by phrenologists. Willis referred the faculty of common sense to the corpus striatum; the imagination he supposed had a locality in the corpus callosum, and memory its seat in the cinerituous matter of the brain. The cerebellum he believed controlled involuntary motion. However much these views may differ from those of modern physiologists, the idea of the brain being a congeries of organs is distinctly recognised. Whilst at Oxford Willis was a member of a philosophical society which is said to have led to the foundation of the Royal Society of London, of which body he was elected one of the earliest fellows. At the solicitation of Sheldon, who was then bishop of London, Willis determined to commence practice in London, and came here in 1666. After the great fire, in 1667 he was immediately appointed physician in ordinary to the king. In 1667 he published a work on the pathology of the brain and nervous system, 'Pathologiæ Cerebri et Nervosi Generis Specimina,' Oxford, 4to. This work, in which he gave an explanation of the phenomena presented in convulsive diseases, hysteria, and hypochondriasis, was bitterly attacked by Highmore, who maintained that the seat of those diseases was in the heart, stomach, lungs, and liver, and not in the nervous system. To the attack of Highmore, Willis replied in a work entitled 'Affectionum quæ dicuntur Hysterices et Hypochondriacæ, Pathologia Spasmodica vindicata,' &c., London, 1670.

About the time of the publication of this last work, he lost his first wife, who was a daughter of Dean Fell. This event afflicted him much, and as a relief to his mind he composed his work on the souls of brutes, entitled 'De Anima Brutorum, quæ Hominis vitalis ac sensitiva est,' Oxford, 4to, 1672. In this work he maintains that the soul of brutes is like the vital principle in man, that it is corporeal in its nature, and perishes with the body. This work, though written for consolation, brought him much trouble. Although it was dedicated to the Archbishop of Canterbury, his orthodoxy, a matter that Willis regarded much, was called in question. These disputes greatly affected him, and he sought relief for his anxiety in a second marriage. He began to publish another work, which he never finished, entitled 'Pharmaceutica Rationalis,' of which the first part was published at Oxford in 1673, and the second in 1675. This work, like his first, was an attempt to explain all the phenomena of disease on the principles of the chemical philosophy. His Latin style is neat and elegant. All his works abound in hypothesis, but they contain a great amount of sound observation, which renders them well worth perusal. Most of his works have gone through numerous editions, and the whole of them, with the title 'Opera Omnia Willisii,' have been published several times in this country and on the continent, but they have long fallen into comparative neglect.

Willis died of pleurisy, on the 11th of November 1675. He was remarkable for his piety, and procured a service to be performed in the church in St. Martin's-lane, every morning early, in order that he might attend before he visited his patients. At his death he left a bequest of 20*l.* a year for the continuation of this service. He also appropriated all his Sunday fees to charitable purposes. He discovered the mineral-spring at Astrop near Berkeley in Northamptonshire, and made it very famous, till the people of the place offending the well known Dr. Ratcliffe, made him declare that he would put 'a toad in their well,' which he did by decrying its virtues wherever he went. There are two English works said to be written by Willis, which were published after his death: the one 'A plain and Easie Method for preserving (by God's Blessing) those that are well from the Infection of the Plague,' written in 1666; and another, a collection of receipts selected from Dr. Willis's medical works.

WILLMORE, JAMES TIBBITS, Associate Engraver in the Royal Academy, was born in London, in September 1800. His teacher in engraving is said to have been a Mr. Burke, but he has formed a style for himself, which very happily renders the peculiarities of our English landscape painters. He has a fine feeling for colour and chiaroscure, and renders the nicer gradations of atmospheric effect in a very admirable manner. Hence he is particularly successful in engraving from the paintings and drawings of Turner, from whose works his best plates have been produced. His chief prints after Turner are, 'The Old Temeraire,' 'Mercury and Argus,' 'Ancient Italy,' 'The Golden Bough,' 'The Dogana,' and 'Bellini's picture conveyed to the Church of the Redentore, Venice,' for the Art Union 1838: he has besides engraved many of the plates in the 'Rivers of France,' &c. His other more important engravings are 'Byron's Dream,' after Eastlake; 'Tilbury Fort,' 'The Rhine,' and 'Powis Castle,' after Calcott; 'Wind against Tide,' and an 'Italian Town,' after Stanfield; and 'Crossing the Bridge,' and 'A Harvest Party,' after Landseer; besides others after Chalon, Leitch, &c. Mr. Willmore was elected into the Royal Academy as associate engraver in 1843. [*See* SUPPLEMENT.]

WILLOCK, WILLOCKS, or WILLOX, JOHN, one of the earliest champions of the Reformation in Scotland, is supposed to have been a native of Ayrshire, about the beginning of the 16th century, and to have studied at the University of Glasgow. In his earlier years he was a friar, but whether Franciscan or Dominican is not clearly ascertained. He visited England in 1541, having before that time become a convert to the opinions of the Reformers, and he was there subjected to imprisonment, as a mitigation apparently of a severer punishment attending a breach of the six articles of Henry VIII. He became afterwards chaplain to the Duke of Suffolk, and on the accession of Mary he fled to Friesland. He was there patronised by the Duchess Anne, who employed him in several missions to Scotland. About the year 1555 he returned to reside in his native country, and preached the doctrines of the Reformation in the town of Ayr. He distinguished himself as a controversialist, and carried on a debate with the principal champions of Catholicism in Scotland. In 1559 he was cited, along with other reformers, to answer for the opinions promulgated by him, and was outlawed for not appearing, a circumstance attributed with apparent justice to breach of faith on the part of Mary, the Queen Regent. He now rose in popularity; large masses of people flocked to his ministrations; and as the head of a party he was immediately powerful to cause the rejection of a proposal by the humbled Regent, that the Romish as well as the Protestant service might be placed at the option of the people. He was one of the four ministers appointed to assist the council of government on the deposition of the Regent. In 1561 he was appointed one of the 'superintendents,' who succeeded to some of the duties of the Catholic bishops. He spent a great part of the remainder of his life in England, but was moderator of several General Assemblies in Scotland from 1563 to 1568. The time of his death is not known. (Wodrow, *Biographical Collections printed for the Maitland Club*, pp. 99-116, 445-453.)

WILLOUGHBY, SIR HUGH. The history of this unfortunate voyager is very obscure. A portrait is shown at Wollaton Hall in Nottinghamshire (an ancient seat of the Willoughbys of Risby in Derbyshire) as that of Sir Hugh. Collins conjectures that 'Sir Hugh Willoughby, Knt., of Risby in Derbyshire, grandson of Sir Henry Willoughby, who died in 1528, by his son William, who died before his father, was the voyager." If this conjecture be correct, Sir Hugh was the son of William, by his wife Helena, daughter and co-heiress of Sir John Egerton, of Wollaton Hall in the county of Chester, and had himself a son Henry (created a baronet by James I. in June 1611), by his wife Johanna, daughter of Sir Nicholas Strelly, Knt.

Clement Adams, in his narrative of Chancellor's voyage, mentions Sir Hugh Willoughby in these terms:—'To which offices and place commendable of the expedition fitted out by the merchants adventurers in 1553], although many men (and some of them void of experience) offered themselves, yet one Sir Hugh Willoughbie, a most valiant gentleman and well born, very earnestly requested to have that care and commandement committed unto him; of whom hath all cause growth by reason of his goodly personage (for he was of a tall stature) as also for his singular skill in the services of war, the company of merchants made greatest account; so that at the last they concluded, and made choice of him for the governor of this voyage, and appointed to him the admiral with authority and command over all the rest.' His appointment was confirmed in a licence to discover strange countries from the King Edward VI., of which a manuscript copy is contained in a volume (Faustina, C., ii.) of the Cotton collection in the British Museum.

The only narrative of this voyage that we have been able to discover is that contained in the first volume of Hakluyt, purporting to be the jornal of Sir Hugh Willoughby himself, and incidental notices in Clement Adams's account of Chancellor's adventures, and in the voyages of Burrough and Jackman in 1556, in the same collection. Among the Cotton manuscripts already alluded to (Otho, E., viii.) there is a list of the three ships fitted out for the expedition, and of the names and offices of all persons embarked in them; and a journal of the voyage from the 10th of May to the end of September 1553. It has been much injured by fire, but enough remains to show that it corresponds exactly with what is printed in Hakluyt's work. It appears to be in the hand-writing of Michael Lok. Purchas (vol. iii., p. 463) mentions "a will of Gabriel Willoughby, his kinsman, subscribed by Sir Hugh, which will I now have, and keep as a relic of that worthy discoverer."

The expedition of which Sir Hugh Willoughby was appointed commander was fitted out by "the mystery and company of merchants adventurers for the discovery of regions, dominions, islands, and places unknown," whose governor was Sebastian Cabot. It consisted of three vessels:—the Bona Speranza, of 120 tons, commanded by Sir

Digitized by Google

Hugh Willoughby, admiral of the fleet, captain, with a master and mate, and 36 seamen; the Edward Bonaventura, Richard Chancellor, pilot-major of the fleet, captain, of 160 tons, with a master and mate, minister, surgeon, and 50 seamen; and the Bona Confidentia, of 90 tons, under a master and mate, with 22 seamen. The vessels were victualled for fifteen months. Six merchants embarked in the admiral's ship, nine in the pilot-major's, and three in the third vessel. The entire direction of the adventure was vested in a council of twelve. The council consisted of the admiral and pilot-major, the master of the three vessels, the minister, three merchants, and the three masters' mates.

The expedition sailed from Deptford on the 10th of May 1553, but was detained in the river and off the coast by baffling winds till the 23rd June. It fell in with the Norwegian coast early next month, off the Rost Islands, on the 14th of July. On the 30th of July, while bearing up for Wardhus, east of the North Cape, and the most easterly station of the Danes in Finmark, the vessels were separated by a storm. Next day the Bona Speranza and the Bona Confidentia once more joined company, but Chancellor's vessel did not again fall in with them. Clement Adams's account of their separation, derived from some mariners of the Edward Bonaventura, is as follows:—"The very same day in the afternoon, about four of the clock, so great a tempest suddenly arose, and the seas were so outrageous, that the ships could not keep their intended course, but some were perforce driven one way and some another, to their great peril and hazard. The general with his loudest voice cried out to Richard Chancellor, and earnestly requested him, not to go far from him; but he neither could nor would keep company with him, but sailed still at the helm, for the admiral was of better sail than his ship. But the said admiral (I know not by what means) bearing all his sails, was carried away with so great force and swiftness, that not long after he was quite out of sight; and the third ship also, with the same storm and force of wind, was dispersed and lost us. The ship-boat of the admiral (striking against the ship) was overwhelmed in the sight and view of the mariners of the Bonaventura; and as for them that are already returned and arrived, they know nothing of the rest of the ships what has become of them." The narrative in the chief text furnished to Sir Hugh Willoughby corresponds with this account in all essentials.

It appears from the journal just referred to, that the Bona Speranza and Bona Confidentia were tossed about in the North Sea from the 30th of July to the 14th of September, in attempting to make Wardhus. On that day they entered a harbour which we learn from Jenkinson was the mouth of the river Arzina, six days' sail east of Wardhus, and one day's sail west of the Swiatoi Nos, the western headland of the White Sea. "This haven," says the journal, "runneth into the main about two leagues, and is in breadth half a league, wherein are very many seal-fishes and other great fishes; and upon the main we saw bears, great deer, foxes, with divers strange beasts, as elians and such others, which were to us unknown and also wonderful. There remaining in this haven the space of a fortnight, we found the year far spent, and also very evil weather, as frost, snow, and hail, as though it had been in the depth of winter, we thought it best to winter there. Wherefore we sent out three men south south-west to search if they could find people, who went three days' journey, but could find none. After that we sent other three westward four days' journey, which also returned without finding any people. Then sent we three men south east three days' journey, who in like sort returned without finding of people or any similitude of habitation." They entered "the harbour of death" (as it is called in the margin of the Cotton manuscript, Otho, E., viii., p. 15) on the 18th of September: they remained a week before resolving to winter there; and they sent out three exploring parties, two of which appear to have been at least six and one eight days absent. This brings us to the latter part of October. The date of Gabriel Willoughby's will, which Hakluyt says was in his possession, shows that some of the party must have been alive in January 1554. Nothing more is known of their fate. In 1557 Stephen Burrough was despatched from Colmogro to search for the Bona Speranza, the Bona Confidentia, and the Philip and Mary, another vessel belonging to the merchants adventurers, which was also missing. At Kegor he learned from a Drontheim skipper that the Philip and Mary had returned to England, and that the Bona Confidentia was lost, and that he had bought her sails for his ship. Of the fate of the Bona Speranza he does not appear to have obtained any intelligence. Anthony Jenkinson, in his account of his voyage to Russia, written apparently between January and April 1558, speaks with certainty of Sir Hugh Willoughby having perished with all his company. Purchas mentions that the Bona Speranza was discovered in the spring of 1554 by Russians, who found all the crew dead. We are left to infer from these vague statements that the journal of the voyage published by Hakluyt, and the will which came into Purchas's possession, were obtained from the Russians. The pilot-major, Richard Chancellor, to whom we owe the earliest English accounts of Russia, reached Colmogro on the Dwina in safety; but his ship was wrecked on his return in Pitlipo Bay (Scotland), on the 10th of November 1556, and himself, along with several of his seamen, drowned. Of the three vessels which composed the expedition to which England owed the commencement of its trade to Archangel, not one returned to this country, and of their crews only a few of the common seamen of the Edward Bonaventura.

(Hakluyt, vol. i (edition of 1599); Purchas, *Pilgrimage*, vol. iii.; MSS. in the Cottonian Collection, British Museum, Otho, E., viii., 23, c.; Faustina, C., ii., 27, f.)

* WILLS, WILLIAM HENRY. There is a rule of a well-known society that no one shall be considered as a man of letters who has not written a book. The limitation of authorship belongs to another period; for a great deal of the best writing of the present day appears in newspapers and other periodical works, and is, for the most part, anonymous. Mr. Wills, though one of the most industrious and influential of journalists, has not written a book; and yet he is entitled to an honourable mention here as the representative of a most important class. He was for several years the chief editorial writer in 'Chambers' Journal;' and is now in the same position in connection with 'Household Words.' Such works especially belong to our age; and upon their judicious conduct depend some of the best results of the general diffusion of a desire for amusing reading. We may mention as an exception to Mr. Wills' anonymous labours, his very beautiful edition of 'Sir Roger de Coverley, by the Spectator,' with notes and illustrations; and 'Old Leaves, gathered from Household Words,' 8vo, 1860. Mr. Wills was born at Plymouth, Jan. 13, 1810.

WILLUGHBY, FRANCIS, was the only son of Sir Francis Willughby, Knight, and was born in 1635. His father, who was in easy circumstances, paid great attention to the education of his son, who was so diligent in his studies that it was feared he would injure his health. The early acquired great knowledge took of the classics and mathematics, and in the various branches of natural science. He was admitted at Trinity College, Cambridge, and took his degree of Bachelor of Arts in 1656, and of Master of Arts in 1659. It was here that he became a pupil of John Ray, and a lasting friendship was soon cemented between the master and pupil. Willughby had a mind constituted very similarly to that of Ray, and both of them took great interest in the progress of natural science. Ray had at this time made great progress in the study of botany, and had already begun to reduce to harmony the confused facts which had been heaped together in that department of science, and this seems to have inspired Willughby to do the same for zoology. The Pandects of Gessner and Aldrovandus had been published, but the question that occurred to his mind was, How much of all this is true, and how much is false? To answer this question for the science of zoology as it then existed, was the work. For this purpose he went to Oxford in 1660, in order that he might consult the works on natural history in the libraries there. Shortly after the return of Willughby from Oxford, Ray refused to sign the Act of Uniformity, and was obliged to resign his Fellowship and leave Cambridge. The consequence was that the two friends made a tour on the continent, visiting France, Spain, Italy, Germany, and the Low Countries, with the object of gaining all possible information on natural history: Ray examined plants, whilst Willughby attended to the animals. They returned laden with treasures, which Willughby immediately commenced working up, for the purpose of publishing a large work on the animal kingdom. Before doing this he contemplated a voyage to America, in order to add to his knowledge. But he died in the midst of all his labours and in the prime of life, on the 3rd of July 1672. He had published little, and thought his labours too imperfect to justify their publication. Ray however urged upon him, as he says in one of his works, for three reasons, that he should allow him to publish his works: first, the glory of God; secondly, the assistance of others in the same studies; and thirdly, the honour of their native land. Upon these grounds he permitted his works to be published, and Ray became their editor. He also left Ray one of his executors, and committed to him the charge of educating his two sons Francis and Thomas. Francis, the elder, who was then only four years old, died young; and Thomas subsequently became Baron of Middleton. For this office, which Ray duly fulfilled, Willughby left him 60*l.* a year, which constituted the chief part of this great man's income throughout his life.

The first work edited by Ray after Willughby's death was his Ornithology, with the title 'Ornithologiæ Libri Tres,' in quibus Aves nostræ hactenus cognitæ, in methodum naturæ suis convenientem redactæ, accurate describuntur. Descriptiones iconibus elegantissimis et vivarum avium simillimis æri incisis illustrantur. Totum opus recognovit, digessit, supplevit Johannes Raius,' folio, London, 1676. This work was translated into English by Ray, and the plates republished, in 1678. It contains a vast amount of original observation, and gives a very full and exact account of the habits of the birds described, as well as of their diseases, and the mode of keeping them. There are frequently also good accounts of dissections of various birds. Cuvier says that all subsequent writers have followed Willughby, and that his observations are wonderfully correct. The English work concludes with a treatise on Falconry. Although Ray seems to have taken great trouble with the plates, they are too inaccurate to be of use at present. But the letterpress is a perennial source of information on the habits and structure of birds. In 1686 Ray edited a second work on the same plan, embracing the fishes. This was published at London, in folio, with the title 'Historiæ Piscium Libri Quatuor.' The descriptions in this work are good, and Cuvier states that it contained many observations on the Mediterranean fishes that

Digitized by Google

could not be found elsewhere. In all his descriptions Willughby was very careful in distinguishing specific characters, and in this way he corrected many of the errors of preceding writers.

Willughby and Ray were early Fellows of the Royal Society of London, and Willughby contributed some papers to the 'Philosophical Transactions' before his death. Two of these were published in the 'Transactions' for 1671; one of them 'On a kind of Wasp called Ichneumons,' and another 'On the Hatching of a kind of Bee lodged in old willows.' Ray afterwards contributed many papers on insects, of which the substance had been prepared from Willughby's manuscripts.

Ray, in the preface to the 'Ornithologia,' has left behind him a beautiful memorial of the estimation in which he held his friend in the summary he there gives of his character. He seems to have added to habits of excessive industry and a rare philosophical genius, every virtue. The influence of Willughby undoubtedly, under the direction of Ray, has been very great in every department of zoology, and had he lived to have laboured more, and to have developed the great principles of classification in zoology, which Ray did in botany, then might it have been said that the foundations of both sciences was laid at the same period in Great Britain. (R.T.)

WILMOT, JOHN, EARL OF ROCHESTER, was born at Dichley (Oxfordshire), 10th of April 1647, or, according to Burnet and Wood, in 1648. He was the son of Henry, earl of Rochester, a brave royalist in the civil wars and a faithful adherent of Charles II. in his exile. He was educated in the free school of Burford, and at Wadham College, Oxford, where he showed remarkable talents. At school he acquired an exact knowledge of Latin, and became familiar with the best authors of the Augustan age, in whose writings he ever afterwards delighted. At college he was placed under the charge of Dr. Blandford, afterwards bishop of Oxford and Worcester, but he abandoned himself to pleasure rather than to study, and, breaking off his course of reading at an early age, set off upon his travels in France and Italy. He returned to England in the eighteenth year of his age, and presented himself at the gay court of Charles II., where the graces of his person and the liveliness of his wit and fancy made him an acceptable companion. He also sought opportunities of distinction in war. In the winter of 1665 he went to sea with the Earl of Sandwich, in the Revenge, commanded by Sir Thomas Teddiman, and displayed great courage in the attack made on the Dutch fleet in the port of Bergen. In the following summer he again went to sea, under Sir Edward Spragge, and in the midst of an engagement volunteered to carry a despatch in an open boat, a service of great peril, which he executed with daring and judgment. These warlike deeds gave him a reputation for courage to which however he did not sustain at court. He was accused of sneaking away in street quarrels, and of evading duels which he had provoked.

He is said to have entered upon a court life free from habits of intemperance, but his convivial disposition, his extreme youth, and the contagious example of a profligate court soon led him into such excesses that, as he assured Dr. Burnet, for five years together he was continually drunk. His fancy was more luxuriant when inflamed by wine, and his companions encouraged his excesses the better to enjoy his wit. In the midst of debauch and debauchery, extravagant frolics and buffoonery, he occasionally found time for poetry. Its character naturally took the cast of his life and talents: personal satires, or drinking and amatory songs were the least ignoble fruits of his genius; licentious and obscene verse, the mere relaxation of his life, was his ordinary occupation; and his liveliness and wit, and the grace and spirit of his versification, only cause us to regret the misapplication of his abilities.

The services of his father and his own favour at court obtained for him the offices of gentleman of the bedchamber and comptroller of Woodstock Park. But although his convivial talents rendered him agreeable to the king, his satires often gave offence. On one occasion, while drunk, he put into the king's hand a paper which he supposed to be a libel he had written upon some ladies, but which happened to be a satire upon King Charles himself. At another time he ventured so far as to scribble upon the door of the king's bedroom the well-known mock epitaph—

> "Here lies our sovereign lord the king,
> Whose word no man relies on;
> He never says a foolish thing,
> Nor ever does a wise one."

Among the various accomplishments of Rochester, that of mimicry was conspicuous. At one time he disguised himself as an Italian mountebank, and practised the art of medicine in Tower-street: at other times he dressed himself as a porter or a beggar, and in such characters diverted himself with low amours.

The incessant debauchery in which his youth was spent brought on painful diseases and a broken constitution. And although his habits and the depraved society in which he lived, together with the love of displaying his wit on all occasions, had poisoned his mind with infidelity, he began to feel remorse, and to treat religion with respect. This change in his opinions was mainly caused by the society of Dr. Burnet, who had attended at the death-bed of one of Rochester's friends, and was otherwise slightly known to him, when he received an invitation to visit the earl, at that time recovering from a severe illness. Burnet listened to his infidel arguments, and answered them with earnest kindness. He explained the Scriptures in a tone of philosophy that suited the intellectual pride of Rochester, and at length convinced him of the truth of religion and of the necessity of repentance. Their interviews are touchingly described by Bishop Burnet himself, in his 'Life and Death of John, Earl of Rochester,' a book which, as Dr. Johnson truly says, "the critic ought to read for its elegance, the philosopher for its arguments, and the saint for its piety."

Early in the summer of 1680 he was seized with his last sickness, which he felt convinced would be fatal. In the midst of the severest agonies of mind and body, he again sent for his friend Dr. Burnet, to whom he expressed his sincere repentance. His last days are affectingly described by the same admirable biographer, and were such as became a Christian. "I do verily believe," says Dr. Burnet, "he was so entirely changed, that if he had recovered he would have made good all his resolutions." He felt deeply the mischief he had done by his example and by his perverted talents; and besought Dr. Burnet to publish, for the good of the world, a history of his sins, his sufferings, and repentance. He died on the 26th of July 1680, in the thirty-fourth year of his age, and was buried beside his father in Spelsbury Church, Oxfordshire. He left behind him a son, who died in the following year, and three daughters.

On his death-bed he had given strict charge that all his licentious and obscene writings should be destroyed; but he was scarcely dead before a volume of poems bearing his name was published. Many of the poems are said not to have been written by him; and that the composition as well as the frolics of others should have been attributed to so notorious a man, is not improbable. Among the best of the poems which seem to be genuine may be mentioned the 'Satire against Man,' 'An Allusion to the 10th Satire of the First Book of Horace,' and 'Verses upon Nothing.'

(*Some Passages of the Life and Death of John, Earl of Rochester*, by Gilbert Burnet, D.D., late Lord Bishop of Sarum; Burnet's *Own Time*; Wood's *Athenæ Oxonienses*; Dr. Johnson's *Life of Rochester*, in *Lives of the Poets*.)

WILSON, ALEXANDER, was born at Paisley, in Scotland, July 6, 1766. His mother died when he was ten years of age, and his father, embarrassed with the charge of a young family, soon married again. In 1779 Alexander was bound apprentice to a loom for three years, on the expiration of which he worked about four years as a journeyman weaver, and then abandoned the loom, and spent nearly three years as a pedlar. From an early age he had been cultivating a talent for poetry, which he imagined himself to possess, and in his excursions for the sale of his wares endeavoured to procure subscriptions for a volume of his poems, but without success. The volume was never published, but verses and single poems were published in newspapers, and separately. 'The Laurel disputed,' a poem on the respective merits of Pennecuik and Ramsay, he recited before a literary society in Edinburgh, and published there in 1791. In 1792 he published anonymously his 'Watty and Meg,' which some at first ascribed to Burns, to the no small gratification of Wilson. His poetry however made no impression on his countrymen in general, and he resolved to emigrate to the United States of North America.

On the 14th of July 1794, Alexander Wilson landed at Newcastle, in the State of Delaware, with only a few shillings in his pocket, and immediately proceeded to Philadelphia. He was employed for a few weeks by a copper-plate printer; he then resumed successively his former occupations of weaver and pedlar, but afterwards became a land-measurer, and ultimately turned schoolmaster, and pursued his new avocation at different places in Pennsylvania and New Jersey. At length, in 1802, he made a contract with the trustees of a school at Gray's Ferry, on the river Schuylkill, in the township of Kingsess, about four miles from Philadelphia, and here he became acquainted with Mr. Bartram, the botanist and naturalist, whose gardens were always open to him, and whose conversation stimulated and improved the taste for natural history which his turn for observation and his rambling life had developed. Here too he became acquainted with Mr. Lawson, the engraver, who gave him instruction in drawing, providing him with landscapes and sketches of the human figure, but with little promise of his becoming a draftsman, till Mr. Bartram proposed a trial of birds in which he succeeded beyond the expectation of his friends; and from that time the ruling passion of his after-life was brought into play. Writing to a friend in Paisley, in June 1803, he says, "Close application to the duties of my profession, which I have followed since November 1795, has deeply injured my constitution; the more so, that my rambling disposition was the worst calculated of any one's in this world for the austere regularity of a teacher's life. I have had many pursuits since I left Scotland—mathematics, the German language, music, drawing, &c.—and I am now about to make a collection of our finest birds." In October 1804, Wilson, accompanied by two friends, set out on a pedestrian journey to the Falls of Niagara. They reached the Falls, and satisfied their curiosity, but were overtaken by the snows of winter on their return. One of his companions remained with his friends near the Cayuga lake, the other availed himself of a conveyance; but Wilson walked on with his gun and bundle, through trackless snows and uninhabited forests, over mountains and along dangerous rivers, and reached home at the begin-

Digitized by Google

uing of December, after a journey of 1257 miles, of which he walked 47 the last day. All the time he could spare was now devoted to the examination of birds, and making drawings of them in colours. In 1806, Mr. Bradford, bookseller, of Philadelphia, being about to publish a new edition of Rees's 'Cyclopædia,' engaged Wilson as assistant-editor. Soon afterwards he explained to Bradford his views of a large work on American ornithology, and the bookseller undertook the publication.

Wilson was assiduous in attention to his duties as assistant-editor, while at the same time he prosecuted the great undertaking which had become the favourite object of his ambition with an enthusiasm which was characteristic of him. At length, in September 1808, the first volume of the 'American Ornithology' was published. From the date of the first arrangement a prospectus had been put in circulation, in which the nature and intended execution of the work were specified, but no adequate idea had been formed of the book which was in preparation, and when the superb volume made its appearance, the American public were alike astonished and delighted. It was in folio, with plates carefully engraved from Wilson's own drawings, coloured after nature, and with admirable letter-press descriptions; the price was 120 dollars. In the course of September 1808, Wilson journeyed eastward and northward, and during the winter went through the southern states, exhibiting his book and endeavouring to obtain subscribers. He visited in fast every town within 150 miles of the Atlantic coast, from the river St. Lawrence to St. Augustine in Florida. He received much praise, but got few subscribers. Wilson however was not depressed.

The second volume was published in 1810, and soon afterwards he set out for Pittsburg on a journey to New Orleans. From Pittsburg he descended the Ohio by himself in a skiff. He started on the 24th of February, and on the 17th of March moored his boat safely in Bear Grass Creek, at the rapids of the Ohio, after a voyage of 720 miles. His hands had suffered a good deal by rowing. He had made excursions from the banks of the river, as he proceeded, with his gun and drawing materials, in search of new species of birds, of which he made drawings and wrote descriptions on the spot where he shot them. He afterwards walked from Louisville to Lexington (73 miles), and on the 4th of May set out from Nashville for St. Louis through the wilderness on horseback, with a loaded pistol in each pocket, a loaded fowling-piece belted across his shoulders, a pound of powder in his flask, and five pounds of shot in his belt, and some biscuits and dried beef. On the fourteenth day he arrived at Natchez, in Mississippi, after a journey through swamps and across rivers, which had nearly killed both his horse and himself. The other volumes of his work were brought out in succession, with astonishing rapidity and regularity; the number of his subscribers increased, and before his death included perhaps every royal personage in Europe. In 1812 he was elected a member of the American Philosophical Society. In 1813 he published the seventh volume. He had completed the pictorial material for the eighth and ninth when he was carried off by an attack of dysentery in his forty-eighth year. He died August 23, 1813, at Philadelphia. The eighth and ninth volumes were completed and published in 1814 by his friend George Ord, who had been his companion in many of his exploring expeditions. Mr. Ord supplied the letter-press descriptions for these two volumes, as well as a biography of Wilson in the ninth. Three supplemental volumes were afterwards supplied by Charles Lucian Bonaparte, folio, 1825-28.

Wilson's pictorial representations of the birds are of great excellence. His descriptions are not only technically accurate, but exceedingly clear and graphic in whatever relates to their motions and characteristic habits. It is a delightful book. The mind is so much absorbed with the images and scenes as to be hardly conscious of the act of reading. Wilson was about five feet ten or eleven inches in height, handsome and vigorous, but rather slender. He was always distinguished by the neatness of his dress and appearance. He was a man of the strictest honesty and the most scrupulous regard for truth; social, affectionate, and benevolent, but somewhat irritable under contradiction and critical objection. He was never married.

(*Memoir of Wilson*, annexed to the *American Ornithology*, by Alexander Wilson and Charles Lucian Bonaparte, in *Cabinet de Lecture*.)

WILSON, FLORENCE, is the name generally given to an Irishman who is spoken of by his contemporaries only by his Latinised designation, Florentius Volusenus or Voluzenus. The vernacular name Wilson has been attributed to him solely because, being a Scotchman, no other common to Scotland approaches so near to that which he assumed. It has been supposed that he was called Wolsey, because he was patronised by the great cardinal, and in a vernacular letter which has been preserved he signs himself Voluzene. He is supposed to have been born near Elgin, in the county of Moray, about the beginning of the 16th century, and to have studied at the University (now King's College) of Aberdeen. He afterwards studied at the University of Paris, where he became tutor to a son of Cardinal Wolsey's brother. Losing this employment at the death of the cardinal in 1530, he was patronised by the Cardinal of Lorraine, and by Du Bellay, bishop of Paris. In 1534 the bishop went on an embassy to Rome, but Wilson, who was to accompany him, was kept by sickness at Avignon. Understanding that Cardinal Sadoleto desired a Latin scholar to teach a grammar-school at Carpentras, the

metropolis of his diocese, he proffered his services in that capacity. Sadoleto has left an interesting account of his interview with the wandering student, and of his surprise in finding one so well versed in polite learning coming from so distant and obscure a country as Scotland. Wilson received the appointment with an annual salary of seventy crowns, and entered on his duties in the year 1535. His earliest work, the publication of which is only known from its being entered in the 'Bibliotheca Thuana,' and mentioned by Gesner, was published at Lyon in 1536. It is also called 'Commentatio quædam Theologica quæ eadem præcatio est, in Aphorismos dissecta.' In 1543 he published the work by which he is best known, 'De Animi Tranquillitate Dialogus.' The scene is laid in a garden near Lyon, and three interlocutors gently debate on the subject of tranquillity of mind, in the manner of the dialogues of Cicero. It was published at Lyon in 1637. A third edition was published at Edinburgh in 1707, under the superintendence of Ruddiman, and a fourth at Edinburgh in 1751, edited by Principal Wishart. In 1546 Wilson formed the design of returning to Scotland, but he only reached Vienne in Dauphiny, where he died, "quam procul à patria," as Buchanan laments in some laudatory lines addressed to his memory. Dempster mentions among Wilson's works, 'Philosophiæ Aristotelicæ Synopsis,' but, unsupported, he is insufficient authority for such a work having existed.

WILSON, HORACE HAYMAN, Professor of Sanskrit at Oxford University, was born in London in the year 1786, and after receiving a professional education, was appointed an assistant-surgeon on the Bengal establishment of the East India Company. He arrived in India in the year 1808, and his general knowledge and versatility of talent soon made him known in Calcutta Society, where his powers as an amateur actor, and musician, were highly appreciated. Stimulated by the splendid example of Sir W. Jones, he entered zealously upon the study of the Sanskrit language, and in 1813 he gave to the world the first fruits of his studies in a translation into English verse of the 'Megha-dúta,' or 'Cloud-messenger,' a short standard Sanskrit poem, highly esteemed by Hindu scholars. Its next published, in 1819, a 'Dictionary Sanskrit and English,' compiled with the help of Pundits from a great variety of Sanskrit authorities. These two works established his reputation as a Sanskrit scholar; the former was admired for its faithfulness and elegance, and the latter was hailed as an invaluable boon to scholars, which in due time greatly promoted Sanskrit learning in Europe. In 1816 he was elected secretary of the Asiatic Society of Bengal, and in 1819 he was appointed member of a commission instituted to reform and remodel the Sanskrit College at Benares. From this time his contributions to Oriental learning were constant, numerous, and diversified. In the 'Asiatic Researches' appeared a History of Cashmere, compiled from Sanskrit authorities; also an account of the Religious Sects of the Hindus, which was justly deemed one of the most valuable papers ever published in the Researches, and which has remained to the present time the chief authority on the subject of which it treats. He now directed his attention to the Sanskrit drama, a specimen of which Sir W. Jones had made known to Europe in his translation of 'Sakoontalá,' and in the years 1826-27 he published a translation in prose and verse of six entire dramas, with analytical descriptions and specimens of twenty-three other dramatic compositions. This work was everywhere received with the highest favour, and has been translated into French and German. His next work was a 'Descriptive Catalogue of the Oriental MSS. collected by Colonel Mackenzie,' to which he prefixed some learned dissertations on the languages and history of India. In 1827 he published also an 'Historical Account of the Burmese War.' While thus laboriously engaged in literary pursuits, his official position as assay-master and secretary of the mint at Calcutta entailed upon him highly responsible duties, and from the records of his office he published in 1830 a statistical work upon the external commerce of Bengal. After the publication of the 'Asiatic Researches' was closed, he continued his still more valuable work, the 'Journal of the Asiatic Society of Bengal,' in the early volumes of which are some valuable contributions from his pen. To the 'Transactions of the Royal Asiatic Society' he supplied an 'Analysis of the Sánkhya Kárika,' and in Calcutta, as secretary of the Committee of Public Instruction, he superintended and revised the publication of many standard Sanskrit texts. The 'Calcutta Quarterly Oriental Magazine' also benefited largely by his constant supply of articles. In the year 1831, while yet in India, he became a candidate for the Boden Professorship of Sanskrit at Oxford, an office which has been lately founded by Colonel Boden, with the view of extending a knowledge of the Sanskrit language in Europe. Three other candidates appeared, but two eventually withdrew, leaving Mr. Wilson and Dr. Mill, then principal of Bishop's College, Calcutta, the only candidates. After a sharp contest, the former was elected by a majority of 207 over 200, the choice undoubtedly falling upon the man who, in the words of the founder, possessed the most "general and critical knowledge of the Sanskrit language." Soon after his arrival in England Professor Wilson succeeded the late Sir C. Wilkins as librarian at the India House, and Sir E. T. Colebrooke as Director of the Royal Asiatic Society. In 1840 he published a translation of the 'Vishnu Purána,' with copious notes and illustrations, which make it quite a mine of Hindu learning. The results deducible from the great discoveries of

Digitized by Google

ancient coins and monuments in Afghanistán and the Punjáb, he made known to the world in a quarto entitled 'Ariana Antiqua.' He next published a valuable grammar of the Sanskrit language, and soon after he brought out a new edition of Mill's 'History of British India,' in which he has endeavoured, by means of notes, to correct many of the errors into which Mill had fallen from his prejudices against the Hindus, and his ignorance of their language and literature. To Mill's work he added 3 vols., continuing the history from 1805 to 1835. He has since compiled an extensive 'Polyglott Glossary of the Technical, Judicial, and Revenue Terms used in different parts of India,' and is now engaged upon a translation of the 'Rig Veda,' three volumes of which have already appeared. In addition to these independent labours he has edited several works, including a translation of Bopp's 'Comparative Grammar,' and he has contributed a great variety of articles on the religion, literature, coins, inscriptions and antiquities of India to the journals of various learned societies, more especially to that of the Royal Asiatic Society. In 1834 he was elected F.R.S., and is now president of the Royal Asiatic Society. He has also been president of the Numismatic and Philological Societies, and has been chosen an honorary member of the chief learned societies of Europe. Professor Wilson married a daughter of G. I. Siddons, Esq., of the Bengal Civil Service, and grand-daughter of the celebrated Mrs. Siddons, by whom he has several children. [*See* SUPPLEMENT.]

WILSON, JAMES, was born in 1805, at Hawick, in Roxburghshire, where his father was a tradesman. He was started in business by his father as a hatter, but was not successful; nor was he more successful in other attempts as a tradesman. At length, in 1839, he published in London a treatise on the 'Influences of the Corn-Laws as affecting all Classes of the Community, and especially the Landed Interests,' 8vo.; and in 1840, 'Constitutions of Currency, Commerce, and Manufactures, referable to the Corn-Laws,' 8vo. The agitation for the repeal of the corn-laws commenced about this time, and in 1843 the 'Economist' newspaper was established, and became a leading vehicle for disseminating the views and reporting the proceedings of the Anti-Corn-Law League. Mr. Wilson was chief editor. In 1846 he was returned to the House of Commons as member for Westbury, and in 1848 was appointed Secretary to the Board of Control, a situation which he held till the breaking up of Lord John Russell's ministry. In 1852 he was again returned for Westbury, and was appointed Financial Secretary to the Treasury, an office which he still continues to hold. In 1857 he was returned as a member of the House of Commons for the borough of Devonport. He advocates a reform of the representation, but is opposed to the ballot. He married in 1832. [*See* SUPPLEMENT.]

WILSON, JOHN, Doctor in Music, was born at Faversham in Kent, in the year 1594. He was first a gentleman of the Chapel-Royal to Charles I., and afterwards Servant in Ordinary to the same king. He was esteemed the best lute-player in England, and "being a constant attendant on the king," sir John Hawkins says, "he frequently played to him, when the king would lean on his shoulder." He was created doctor in music at Oxford in 1644, and in 1656 was elected professor of the same faculty to that university, with the advantage of having apartments in Balliol College, where, assisted by the royalists, he excited "such a love of music as in process of time accounts for that flourishing state in which it has long subsisted there," and of which Antony Wood has, in his life of himself, given an interesting account. After the Restoration he entered into the service of Charles II., succeeding the famous Henry Lawes, and died in 1673. He composed much sacred music, but many of the Odes of Horace, as well as select passages from Ausonius, Claudian, and Petronius Arbiter; though few of his works are now to be met with, and of these the most pleasing are published in Playford's 'Musical Companion,' 1667, an interesting and excellent collection of vocal partmusic, which he became very scarce.

WILSON, PROFESSOR JOHN, was born on the 19th of May 1785, at Paisley in Scotland, where his father was a wealthy manufacturer. He was the eldest son: one of his brothers, James, became distinguished as a naturalist; one of his sisters became Mrs. Ferrier, and is the mother of Professor Ferrier of St. Andrews; and another of his sisters married Sir John Macneil. At an early age, the future poet and essayist was sent to a school at Glenorchy in the Highlands kept by the Rev. Dr. Joseph McIntyre; and here he acquired his first enthusiasm for Highland scenery and his love of open air exercises. At the age of thirteen he went to the University of Glasgow, where, after five years of study, he removed in 1803 to Magdalen College, Oxford. At Oxford he was distinguished no less for his literary genius and attainments—as shown in his carrying off, among other honours, the Newdegate prize in 1806, for an English poem 'On the Study of Greek and Roman Architecture,'—than for the exuberance of his animal spirits, his great physical strength and beauty, and his fondness for athletic sports. He was the best boxer, leaper, and runner about the University. He graduated B.A. in 1807, and in 1810 he took the degree of M.A. "A fair-haired Hercules-Apollo," says a writer, sketching his life at this time, "and with plenty of money enabling him to gratify his taste whatever they might be, he had scarcely left Oxford, when he signalized his double character by purchasing, or having purchased for him by his father, the small, but beautiful estate of Elleray on Lake Windermere, where as Hercules, he might yacht about at his pleasure, beat the best boatman at the oar, and wrestle or box with the strongest daleman, and, as Apollo, he might revel in the quiet beauties of the finest of English scenery, indulge undisturbed in poetic dreams of his own, and cultivate with due reverence the society of Wordsworth." Here, besides Wordsworth, he became acquainted with Coleridge, Southey, and De Quincey, the last of whom describes the extraordinary manliness of his character at this time, dashed with an eccentricity which showed itself in all kinds of freaks and projects—and among them that of becoming a traveller in Africa. It was at this time (1810) that he married an English lady of wealth whom he met when he was on a visit to the Lakes with her family, and, falling in love with her at first sight, wooed and won with romantic rapidity. He had by this time published some anonymous writings in Coleridge's 'Friend,' and elsewhere; and in 1811 he published anonymously in Edinburgh, 'Lines sacred to the memory of the Rev. James Grahame,'—i.e. the poet Grahame, the author of 'The Sabbath.' Though his summer head-quarters were at Elleray, Wilson spent part of every year in Edinburgh, and the following extract from a letter of Scott to Miss Joanna Baillie will show the impression which he had begun to make in Edinburgh: "The author of the Elleray upon poor Grahame is John Wilson, a young man of very considerable poetical powers. He is now engaged on a poem called 'The Isle of Palms,' something in the style of Southey. He is an eccentric genius and has fixed himself on the banks of Windermere, where occasionally resides in Edinburgh, where he now is. . . . He seems an excellent, warmhearted, and enthusiastic young man; something too much perhaps of the latter quality places him among the list of originals." The 'Isle of Palms' here alluded to, was published in 1812, and gave Wilson a place among the Lake Poets. In 1815 he was called to the Scottish bar, at which, however he never practised; and from that time forward Edinburgh was his accustomed place of residence. He wrote for the 'Edinburgh Review' a criticism on the 4th canto of 'Childe Harold'—his only contribution to that periodical. "His prepossessions, both political and literary, led him to attach himself to the little band of young Tories, with their not inauspicious veteran to advise them, who were disposed to break out in rebellion against Jeffrey's Whig supremacy in the northern world of letters; and, accordingly, when Blackwood (1817) started his magazine to afford an outlet for native Scottish Toryism similar to that which had been already provided in the 'Quarterly Review' for English Toryism in general, Wilson was one of the first to join him. He had just then added to his laurels, as one of the Lakists, by the publication (1816) of a poem of some length, entitled 'The City of the Plague;' his magnificent physique was the admiration of Edinburgh, so that, as he walked theatrically along Princes-street in somewhat wild costume, and with his fair hair streaming from under his broad white hat, heads were turned to look at him; and his reputation in social circles was that of a young Goth of genius with powers undeveloped, which would one day astonish Britain." At first Wilson was associated with Lockhart and others in writing for 'Blackwood;' but that was not till 1824 or 1825, that that publication was identified with him to the full extent.

The connection with Blackwood was an important event in the life of Wilson; and it was specially followed (1820) by his appointment to the chair of Moral Philosophy in the University of Edinburgh, then vacant by the death of Dr. Thomas Brown. The appointment was made rather on the grounds of Wilson's political opinions and his promising genius than on the evidence of any special works already produced on metaphysics or philosophy. William Hamilton, afterwards Wilson's colleague, was a defeated candidate on the occasion. Scott, who used all his influence in behalf of Wilson, wrote to Lockhart expressing his hope that if he obtained the appointment, it would give him "the consistence and steadiness of character which he all he wants to make him the first man of the age." The appointment, together with his connection with Blackwood (both of which came at a time when some pecuniary reverses had obliged him to break up his little establishment at Elleray) had, at all events, the good effect of determining Wilson's genius permanently to prose rather than to verse. He still, indeed, wrote verse in the Lakist style in quantity sufficient, when added to what he had already written, to make two octavo volumes of poetry in all in 1825; but this is no proof that in verse he would ever have been more than one of the minor Lake poets. It was in prose, and more especially as a poet in prose, that his genius was to display itself in its full capacity; and both the magazine and the lecture room gave him the necessary opportunities. "He wrote," says the author of the sketch already quoted, "tales for the magazine, in which, while his imagination had as free scope as it had in verse, his constitutional Scotticism, his shrewd observation of Scottish humours, his sensibility to the woes of real life, and his powers of eloquent description and delineation of character, had a still freer and more minute range. Some of these tales, with others written independently, formed collectively his first professed prosework, published, in 1822, under the title of 'Lights and Shadows of Scottish Life' and followed in 1823 by a one-volume novel called 'The Trials of Margaret Lyndsay.' He wrote also political articles on the questions of the day in which he blazed out as a Tory in a manner heartily satisfying to his instincts, and yet not possible had he kept to metre. He wrote literary criticisms, in which he advanced and

expounded canons of taste, especially in poetry, deeper than those of Jeffrey, and vindicated against that critic and his disciples the poetic claims of Wordsworth and the writers associated with him. He wrote, either as lectures or as articles, subtle philosophical disquisitions, not very connected or systematic perhaps, but gleaming with brilliant ideas, and tinged throughout with that rich and highly-coloured mode of metaphysics which Coleridge was diffusing through England. Lastly, careless of the formality conventionally identified with the gown of a Scotch professor, and that the gown of a professor of moral philosophy, he wrote papers for the magazine in which he was seen relapsing ideally into his character as an untrammelled human being, a bruiser at country-fairs, a sportsman on Scottish hills and rivers, a boon-companion among bacchanalians, commenting on manners and manners, on life and literature, from the point of view of an inspired king of the gypsies or from amid the uproarious conditions of a city orgy.' Among these papers of riotous phantasy, the most famous were the series called the 'Noctes Ambrosianæ,' which had been begun in 1822 when Lockhart, as well as Wilson, was a contributor to Blackwood, but which, taken up in 1825 by Wilson for himself, after Lockhart's departure for London, were continued by him till 1836, when the death of the Ettrick Shepherd, their principal supposed character, naturally put an end to them. It was these 'Noctes' that carried the name of "Christopher North" over the world as the pseudonym of Wilson. They were followed by a series called 'Dies Boreales,' which extended from 1836 to 1846, but were less popular.

After the death of his wife, which took place about 1840 and left a profound sorrow in his heart, Wilson was much less active than he had till then been. He still figured as Christopher North in stray papers in 'Blackwood;' in 1842 he even published separately, under the title of 'Recreations of Christopher North,' a selection of his contributions to the magazine; and still as "The Professor" he was one of the lions of Edinburgh society and the idol of successive classes of students "to whom he lectured his moral philosophy from the backs of old letters, and who cheered him till the roof rang at the end of every eloquent period;" but on the whole, the best of his career was over. Latterly, too, ill-health reduced his once abundant vigour. He continued in the discharge of his professional duties till 1852-53, when paralysis and decay incapacitated him. A pension of 300*l.* a year had been granted to him by government. He lived for a time in retirement at Lasswade, near Edinburgh; and died at Edinburgh on the 3rd of April 1854. In the following year his nephew, Professor Ferrier, who is also his son-in-law, began the publication of a collected edition of his works. The 12 volumes of which it consists include the 'Noctes Ambrosianæ,' and the famous 'Essay on Burns,' which was published separately long ago; and now the series of volumes is complete, the world has for the first time ample materials before them for an estimate of the genius of Wilson, both as to quantity and variety of production, and as to quality. (*Christopher North: a Memoir of John Wilson, late Professor of Moral Philosophy in the University of Edinburgh*, by his Daughter, Mrs. Gordon, 2 vols. 1862.)

WILSON, RICHARD, R.A. This great landscape-painter was born of a respectable family at Pinegas in Montgomeryshire, in 1713. He was the third son of seven children, six sons and one daughter. His father was a clergyman, at the time of Richard's birth, in Montgomeryshire, but he was shortly afterwards collated to the living of Mold in Flintshire. Young Wilson showed very early a taste for drawing, and gave such promise, that his relation Sir George Wynne took him to London and placed him with an obscure portrait-painter of the name of Thomas Wright, who lived in Covent Garden. Under this master he made great progress, but nothing is known of his earliest studies. He must however have attained some rank as a portrait-painter, for in the year 1748 he painted a large picture of the Prince of Wales and his brother the Duke of York, for their tutor Dr. Hayter, bishop of Norwich.

After practising some time with success as a portrait-painter in London, he went, in 1749, to Italy to study the great works of the Italian masters. He had as yet tried little if anything in landscape-painting; but while at Venice he paid a visit to Zuccarelli the landscape-painter, who happened to be from home, and Wilson, to pass the time until he came, made a sketch in oils of the view from the painter's window. Zuccarelli thought so highly of this sketch, that he recommended Wilson to give up portrait and to take to landscape. Another circumstance which happened to him in Rome induced him to follow this advice. Vernet, the celebrated French landscape-painter, visited him in his studio at Rome, and was so much struck with a landscape of Wilson's which he saw there, that he offered to make an exchange with him of one of his own landscapes for it, which was readily assented to by Wilson. From this time he devoted himself to landscape, and soon acquired so great a reputation, that he had many scholars even while in Rome, and Mengs offered to paint his portrait for a landscape. Wilson did not do as many painters have done, that is, copy the works of celebrated masters, but he went immediately to the source of all art, and confined his studies to nature. By this course he attained that bold natural yet classical style for which he is distinguished, avoided the acquisition of adventitious beauties, and escaped the mannerism which generally arises from the too partial study of favourite masters.

He returned to London in 1755, after an absence of six years. In 1760 he exhibited, in the great room at Spring Gardens, his celebrated picture of Niobe, which was purchased by William, duke of Cumberland. This work established his reputation in England as one of the first landscape-painters of his time. In 1765 he exhibited in the same place a 'View of Rome from the Villa Madama,' which was purchased by the then Marquis of Tavistock. He was one of the first members of the Royal Academy, which was founded in 1768; and at the death of Hayman, in 1770, he was appointed librarian in his place: this appointment brings a very small emolument with it, yet, small as it is, Wilson solicited the place; for although a few discriminating connoisseurs purchased some of his best pictures, he was neglected by the body of picture buyers, and was in a state of comparative indigence. He was also, probably in part from his uncouthness of manner and unpliant temper, unpopular with his fellow-academicians. Reynolds and Wilson are said to have regarded each other with mutual dislike. As landscape-painters Barrett and Smith of Chichester were in much greater request than Wilson. The following anecdote gives a deplorable picture, if true, of Wilson's prospects. He was, it is told, in the habit of taking his works round to the various brokers and selling his pictures for whatever they would give him. Upon one occasion, when he took a painting to a picture-dealer in St. James's parish, he was led up to the attic by the dealer, who, opening a door, pointed to a pile of landscapes against the wall, and said, "Look ye, Dick, you know I wish to oblige you; but see, there's all the stock I've paid you for these three years." And it is a fact that some of these landscapes, for which Wilson received only a few pounds, have been since sold for nearly as many hundreds.

Wilson was generally so unfortunate in the sale of his works, that when one met with a ready sale and more than usual attention, he repeated it; and he painted some subjects as many as four or even five times, making only very slight alterations: he painted five pictures of Ascanio's Ville at Tivoli. The following are among his principal works:—'Niobe;' 'Phaeton;' large view of Rome; 'Villa of Mæcenas at Tivoli;' large view on the river Po in Italy; a companion to it, called 'Solitude;' 'View on the coast of Baiæ;' 'View on the Strada Nomentana;' 'Hadrian's Villa;' several views near Rome; 'Temple of Bacchus near Rome;' 'View on the Tiber;' 'View of the Bridge of Rimini;' the 'Lake of Nemi;' 'Cicero at his Villa;' 'View of Ascona;' 'Broken Bridge of Narni;' 'Ruins on the coast of Baiæ;' 'Temple of Venus at Baiæ;' 'Island of Venice;' 'View of Venice;' 'Herakles and Omphale;' 'Apollo and the Seasons;' 'Celadon and Amelia;' 'Meleager and Atalante;' 'Ceyx and Alcyone;' 'Sion House from Kew Gardens;' 'Tabley House, Cheshire;' 'View on the river Dee;' 'Wilton House;' 'View on the river Wye;' 'View on the Thames;' 'View of Beaumont's Pond, St. James's Park;' 'View of Croome, Worcestershire;' 'View of Moor Park, Herts;' 'the Hermitage;' 'View of Dover;' 'Llangollen Bridge, with Castle Dinas Bran;' 'View near Llangollen Bridge;' 'View of Oakhampton Castle;' 'Carnarvon Castle;' 'Kilgarron Castle;' 'Pembroke Town and Castle;' 'Caernarvon;' 'Cader Idris;' and the great bridge over the Taffe; besides a great many landscapes which have no particular designation. The figures in his landscapes are not all painted by himself; he occasionally availed himself of the assistance of Mortimer and Hayman. Many of Wilson's works have been engraved; of the following engravings after executed plates after them:—Woollet, who has engraved nine; W. Sharpe, who executed the figures in the 'Niobe' engraved by Samuel Smith; Ponncey; Ellis; W. Byrne; W. Elliott; J. Mason; P. C. Canot; E. and M. Rooker; J. Wood; J. Roberts; J. Gandon; J. Farrington; W. Hogarth; Middiman; Earlom; Cockburn; C. Turner; T. Morris; Reynolds, &c.

Wilson changed his residence very often. He first lived in the Piazza, Covent Garden; then in Charlotte-street, Fitzroy square; in Great Queen-street, in Lincoln's Inn-Fields; in Foley-place, and in other places; but his last residence in London was a mean house in Tottenham-street, Tottenham-court-road, of which he had the first and second floors, where he lived almost without furniture. The last two or three years of his life however were spent in affluence, owing to some property which he inherited from his brother. He retired to the house of his relation Mrs. C. Jones, called Colemondie: it is near the village of Llanverris in Denbighshire, now called Loggerheads. He died at the last-named place in 1782, aged sixty-nine, and was buried in the churchyard of Mold. The village of Llanverris is now generally called Loggerheads, on account of the sign of the Loggerheads which Wilson painted for the public-house of the village.

There is a common report that Wilson composed his picture of 'Ceyx and Alcyone' for a pot of beer set on the remains of a Stilton cheese; whereas the correct version of the story is, that it was partly composed from a pot of beer set on the remains of a Stilton cheese, which any one may perceive to be the correct version by looking at the composition. Wilson, like many other men of genius, has had many stories told of him which are not true, and are not worth contradiction. Three of Wilson's landscapes—'The Ruins of the Villa of Mæcenas at Tivoli,' a work of great force; 'Landscape with figures representing the Destruction of Niobe's children,' one of his classical works, well known by Sir Joshua Reynolds's criticism on it; and a 'Landscape with Figures,' form a part of the National Gallery; and there are four small pictures by Wilson in the Vernon Collection: they are now all exhibited together at South Kensington.

WILSON, GENERAL, SIR ROBERT THOMAS, the son of Mr. Benjamin Wilson, a painter in Bloomsbury, was born in 1777. Having been educated at Westminster and Winchester, he went to Flanders as a volunteer in 1793, and in the following year obtained a commission in the 15th Dragoons; by a daring act he saved the Emperor of Germany from being taken prisoner at Villers en Couche. He subsequently served in Ireland during the rebellion of 1798, and also in Holland, and in 1800 succeeded to a majority in Hompesch's Mounted Rifles. He also for a time held a military command in the South West District. Having served for a short time in the Brazils and at the Cape of Good Hope, he was sent on a secret mission to the Continent under Lord Hutchinson. In 1808 he superintended the embodiment of a regiment of Portuguese refugees, and raised and formed the Lusitanian Legion. He afterwards commanded a Spanish Brigade under Sir Arthur Wellesley, and took an active part in the battle of Talavera. From 1812 till 1814 he was British military correspondent at the head-quarters of the allied armies, and for some time held command of the Prussian reserve; at the head of this force he drove back the French to Lützen. He incurred the displeasure of the military authorities by assisting in effecting the escape of Count Lavalette, who had been condemned to death as an accomplice of Napoleon. A narrative of this adventure may be found in the 'Gentleman's Magazine,' vol. 86, part i. p. 625. On the funeral of Queen Caroline he expressed his disapproval of the course pursued by the government with respect to that unfortunate lady, and in consequence was dismissed from the army and deprived of the many foreign orders which he had won by his gallantry. He sat as member for Southwark, in the Liberal interest, from 1818 till 1831, when he retired in favour of Mr. W. Brougham. Having been restored to his rank in the army, he became a general in 1841, and held the post of governor and commander-in-chief of Gibraltar from 1842 till 1849. He died suddenly in London, soon after his return to England, May the 9th, 1849. He was the author of a 'Translation of Jomini's Napier's 'Campaign in 1801 in the East and in Egypt,' and afterwards of a mere correct original narrative of those events, printed in 4to, under the title of an 'Historical account of the British Expedition to Egypt.' His other publications were 'An Enquiry into the Military Force of the British Empire' (1809), 'Campaign in Poland with Remarks on the Russian Army' (1811), and a 'Sketch of the Military Power of Russia' (1817), which was severely criticised at the time of its appearance in the 'Quarterly Review:' Sir R. Wilson replied in an animated pamphlet; but the controversy is long since forgotten.

WILSON, DR. THOMAS, a noted statesman and scholar of Queen Elizabeth's time, was the son of Thomas Wilson of Stroby, in Lincolnshire. He was educated at Eton and at King's College, Cambridge, and after words became tutor to the two sons of the Duke of Suffolk. In 1551 he published 'The Rule of Reason containing the Art of Logic;' and in 1553, 'The Art of Rhetoric.' Both works were frequently reprinted in the course of the century, and both have received much commendation from modern critics; the latter in particular having been said to give the title to the second era in the earliest critical writer in the English language. Full specimens of it are given by Warten. On the accession of Queen Mary, Wilson found it convenient to retire to the Continent. He took the degree of Doctor of Laws at Ferrara; but, on proceeding to Rome, was apprehended by the Inquisition, and is said to have been put to the torture; the grounds of charge being said to have been found in the works he had published. On the death of Pope Paul IV. (1555), the discontented populace of Rome broke open the prison of the Inquisition; and Wilson was one of the prisoners who then escaped. On Elizabeth's accession he returned to England, was immediately taken into the public service, and rose rapidly from place to place. He was at first master of requests, and master of St. Catherine's Hospital, and private secretary to the queen: in 1576 he was sent as an envoy to the Low Countries; and in 1577 he was appointed one of the secretaries of state, and afterwards became a dean of Durham. He died in 1581.

WILTON, JOSEPH, R.A., a successful sculptor in his day, and the fashionable precursor of Nollekens in English bust-making. He was born in London in 1722; his father was a wealthy plasterer, and when his son was of a sufficient age, he sent him abroad to study sculpture. Wilton studied at the various towns in Brabant, at Paris, and at Rome, where in 1750 he was presented with the Jubilee gold medal by Benedict XIV. He spent eight years in Italy, chiefly occupied in copying ancient statues. He returned to England in company with Cipriani, Chambers, the architect, and a clever modeller of the name of Capizzoldi, who assisted him in some of his works. When the Duke of Richmond opened a gallery for students in art, in Spring Gardens, he appointed Cipriani and Wilton the directors of it. Wilton was afterwards appointed coach-carver to the king, and he modelled the coronation coach of George III. Of his public works the principal are—the monument to General Wolfe in Westminster Abbey, of Admiral Holmes, of the Earl and Countess of Montrath, and of Stephen Hales. He made busts of Bacon, Cromwell, Newton, Swift, Wolfe, Chatham, and Chesterfield, besides many others. All his works were, like those of Roubiliac, admirably worked in the marble, but he showed little taste in his compositions; they were too crowded and too minute in accessories; and evince a total misconception of what constitutes a well-adapted design for sculpture. Wilton however made a large fortune and lived in great style. He kept almost an open board, and among others, Wilson, the landscape painter, and Baretti, the lexicographer, were often seen making their way to Wilton's at dinner-time. He had a very beautiful daughter, who was married to Sir Robert Chambers. In the Royal Academy there is a bust of Wilton by Roubiliac, the present of his daughter Lady Chambers. Wilton was one of the founders of the Royal Academy. He died November 25, 1803.

WINCKELMANN, JOHANN JOACHIM, was born at Stendal in Prussia, in 1717. His parents were extremely poor, and could not assist him in his desire to study, for which he displayed an extraordinary disposition when very young. He however laboured so assiduously in the free-school of his native place, that he soon rose to the top of it, and attracted the notice of the rector Tappert, who took him into his house as a companion, and when the old man grew blind Winckelmann was of the greatest service to him in reading to him and leading him.

In 1735, in his eighteenth year, he went to Berlin and studied at the Köllnische Gymnasium. During this year he walked to Hamburg to attend the sale of the books of the celebrated Fabricius, and to buy some good editions of the ancient classics. The money for the journey and the purchase of the books he begged of the clergy, gentry, and noblemen on the road. In 1737 he returned to his native place; and in 1738 he entered the University of Halle, with the intention of studying theology. He remained two years at Halle, and found that the study of theology did not suit him. In 1741 he procured a situation as tutor in a private family at Osterburg. In 1742 he procured a similar situation at Heimersleben, near Halberstadt, where he commenced the study of general history, and is said to have read Bayle's 'Historical Dictionary' twice through. In 1743 he was appointed Conrector of the school of Seehausen, a miserable situation, where it did not damp the courage of Winckelmann. He seldom went to bed; he used to sleep on a bench wrapped in a fur cloak; devoting what time he could spare from four in the morning until twelve at night to the study of ancient literature and of history. In 1748, sick of this life of drudgery, he petitioned the Graf von Bünau for a situation in his library at Nöthenitz, near Dresden. The place of librarian was engaged, but the count offered Winckelmann that of secretary of the library, with a salary of eighty dollars per annum (12l. sterling). Winckelmann accepted this situation with pleasure, and removed at Nöthenitz for a few years, enjoying a kind of contentment, but he constantly felt that he was fitted for better things than making extracts from other men's writings and for other men. His vicinity to Dresden, and the attractions of the great gallery there, induced him often to perform the journey from Nöthenitz to the capital, where he became acquainted with artists, and he endeavoured to become one himself; but to apply himself practically to any of the arts he found it was too late, and he resolved therefore to devote himself to their history and theory. In his ramblings in the gallery he formed three valuable acquaintances—those of Oeser, the painter, and of the diletanti Lippert and Hagedorn. Winckelmann formed also, at Nöthenitz, the acquaintance of the pope's nuncio, Monsignor Archinto, who, struck with the extensive learning and acquirements of Winckelmann, told him that if he would change his religion (from Protestant to Catholic) he would procure him a situation in the Vatican library, or at least a pension sufficient to enable him to prosecute his studies in Rome. This offer came upon Winckelmann like a dream. In 1754 however, after much hesitation, he formally embraced the Roman Catholic religion, and gave up his situation with Count Bünau. Some difficulties with the pension delayed his journey to Rome, but in the meantime he lodged with Oeser in Dresden, and prosecuted his new studies with redoubled ardour. The first fruit of these labours was his little work entitled 'Reflections upon the Imitation of the Antique' (Gedanken ueber die Nachahmung der griechischen Kunstwerke), published in Dresden, in 1755. In this treatise only fifty copies were printed, and it is now a literary curiosity. At the end of 1755 the difficulties about the pension were enmounted, and Winckelmann left Dresden for Rome, with a pension of two hundred rix-dollars (45l.) granted him by the elector of Saxony for two years.

He took letters with him to Mengs and to the pope's physician Laurenti, through whose interest he was presented to the pope, Benedict XIV., and found easy access to all the literati and virtuosi of Rome. Mengs was his oracle in all matters of virtù; he was in his house, and formed his notions of the ideal and beautiful entirely from the conversation of Mengs. In 1756 he published a new edition of his treatise upon the imitation of the antique, with two other treatises. In 1758 Winckelmann made a journey to Naples to examine the interesting remains of Herculaneum, Pompeii, and Paestum. His intention of writing a history of ancient art was now generally known, and his poverty was also known, and he received two presents of money after his return from Naples—one from the engraver, Wille, of Paris, and the other from Caspar Fusali, a painter and bookseller at Zürich. In this year he arranged the library of Cardinal Archinto, who gave him free apartments, but no salary. He went also in the same year to Florence, to make a catalogue of the cabinet of cameos, &c. of Baron Stosch, which detained him nine months ('Description

Digitized by Google

des Pierres gravées du feu Baron de Stosch'). Upon his return to Rome, the Cardinal Albani offered him the place of his librarian and custos of his gallery of antiquities, with apartments free, and a monthly salary of ten scudi: a situation exactly suited to the taste of Winckelmann, and which, with his salary from Dresden, which was still continued, enabled him to live at ease and in comfort; for about thirty shillings a week and a free lodging was, in Winckelmann's time, a good bachelor's allowance at Rome.

In 1762 his 'Remarks upon the Architecture of the Ancients' (Anmerkungen über die Baukunst der Alten) was printed in Germany. In 1763 he received the appointment of Antiquario della Camera Apostolico, with a salary of about 15 scudi per month; he had also from the Cardinal Albani, who succeeded in 1761, after the death of Cardinal Passionei, to the post of librarian of the Vatican, a retaining salary of 50 scudi per annum, for the first vacancy in the Vatican library. In 1764 appeared at length, at Dresden, his 'History of Ancient Art' (Geschichte der Kunst des Alterthums). About the same period appeared his 'Sendschreiben ueber die Herculanischen Alterthümer,' and 'Nachrichten von den neuesten Herculanischen Entdeckungen.' He now became known throughout Europe, was elected a member of several foreign scientific and literary societies, and acquired many friends and some enemies, especially among dilettanti, who found some of the critical opinions and theories of Winckelmann particularly obnoxious. In 1765 the King of Prussia offered Winckelmann, through Colonel Guichard, the superintendence of the library and museum of antiquities of Berlin, but as Winckelmann demanded a salary of 2000 dollars (300£), double what the king offered, the negociations ceased. In 1766 appeared his 'Monumenti Antichi Inediti,' with 227 plates; in 1767, 'Anmerkungen zur Geschichte der Kunst,' as a sort of supplement to his History.

In 1768 he revisited Germany with the sculptor Cavaceppi, after an absence of twelve years, but he had no sooner passed the Alps than he complained of the chilling appearance of everything around him, and wished to return to Italy. Cavaceppi however with much difficulty persuaded him to go to Munich, where he was well received, and even as far as Regensburg; but Winckelmann would not go one step farther, and he changed his course for the road to Vienna, on his way back to Italy. His friend accompanied him, and they arrived on the 12th of May at Vienna. In Vienna the greatest attentions were paid to him, and several persons of distinction endeavoured to persuade him to prosecute his journey to Berlin, his original destination, but all failed. Winckelmann left Vienna for Trieste in the beginning of June: the last portion of his journey he made in company with an Italian scoundrel of the name of Francesco Arcangeli. This man had been cook to the Count Cataldo in Vienna; he perceived the simplicity of Winckelmann's character, and gained his confidence, and Winckelmann showed him a gold medal and other presents of value which he had received at the court of Vienna. At Trieste he was obliged to wait for a vessel to Ancona, and as he was sitting in his room at his inn, on the 8th of June, his travelling companion came to take leave of him, telling him that he was obliged to go into the town on some business, and he requested him before he went to let him again look at the medal which he had received at Vienna. Winckelmann, as unsuspicious as a child, immediately complied, when the villain suddenly attacked him with a knife; a struggle ensued, and Winckelmann fell pierced with five stabs in the stomach. At this time a child with whom Winckelmann had been playing knocked at the door; the murderer fled without his booty, but he was afterwards caught and executed. Winckelmann died seven hours after he had received the wounds, in the fifty-first year of his age. He bequeathed his property, with the exception of a small sum of money, to the Cardinal Albani. The manuscript additions and notes he had prepared for the new edition of his 'History of the Arts of Antiquity' were deposited in the Imperial Academy of the Arts at Vienna, and in 1776 a new edition of the work was published there by the Academy, but it was so carelessly done that it created general disappointment.

Winckelmann's chief work is his 'History of Ancient Art,' but it is very incomplete, as he himself was well aware; nor can it be looked upon as any more than what the Germans call 'Ideen zur Geschichte,' and had he lived he would most probably have left a very different work. As it is however, when we consider that he had to pioneer his own way through an untrodden path, it is a work of great merit, although to him, owing to the vast store of classical learning which he brought to the task, it may have been a labour of comparatively easy accomplishment. A history of ancient art it is not; it is rather a critical account of the remains of ancient art, and in some parts certainly hypercritical, and in others a mere elaboration of theories. Painting is little more than touched upon. The reputation of Winckelmann was limited to the learned before Göthe wrote his eloquent dissertation upon the character of his genius and writings, which was published in 1805 at Tübingen, together with his letters to Berendis, twenty-seven in number, and a sketch of the history of the arts of the 18th century, under the title of 'Winkelmann und sein Jahrhundert.' Five collections of Winckelmann's letters have been published at different periods, amounting in all to 425.

One consequence of the writings of Winckelmann, and that a productive one, is, that they have led many scholars and artists to turn their attention to a subject before—at least for a period—comparatively neglected; and the result has been several learned and valuable works, both French and German, upon the history and archæology of art. Some of Winckelmann's views have very properly met with strong opponents, and may now perhaps be considered as exploded. In 1808 a complete edition of his works, with the exception of the 'Monumenti Antichi Inediti' and the catalogue of Baron Stosch's cabinet of gems, was commenced to be published at Dresden, edited by Fernow, Meyer, Schulze, and Siebelis; it was completed in 1820, in 8 vols. 8vo, including indexes. This edition contains a few short treatises which have not been mentioned in this notice, the biography of which has been taken from the short Life of Winckelmann prefixed to the Dresden edition of his works.

WINDHAM, LIEUT-GENERAL CHARLES ASH, is a native of the county of Norfolk, and belongs to a family of great antiquity and respectability. He is son of Colonel Windham, and entered the army on the 30th of December 1826 as lieutenant. He became captain May 31, 1833; major, November 9, 1846; lieutenant-colonel, December 29, 1846; and colonel, June 20, 1854. He was attached during many years to the Coldstream Guards. During the campaign in the Crimea, Colonel Windham served as assistant quarter-master-general of the Fourth Division. When Sir George Cathcart was slain at the battle of Inkermann Colonel Windham was near him, and afterwards, being the only mounted officer unwounded, succeeded him in the command of the troops till the end of the action. He was afterwards appointed by General Simpson to succeed Brigadier-General Lockyer in the command of the second brigade of the second division. On the night when the Malakoff was attacked Colonel Windham led the column which stormed the Redan, and he remained within the fortress leading and stimulating the troops. At length, having sent three times to General Codrington for fresh troops in support, and finding that no assistance came, he said to Captain Creslock, "I must go to the general for support. If I do not come back to you, in case I am killed, why I went away." He reached General Codrington, through a storm of balls, without having been struck; but immediately afterwards the troops retreated in confusion from the Redan. After the capture of Sebastopol, Colonel Windham received the appointment of governor of the Russian barracks—that part of the fortress which the British occupied. By the Crown he had been created a Commander of the Bath, July 5, 1855, and was now promoted to the rank of major-general, "for his distinguished conduct in having with the greatest intrepidity and coolness headed the column of attack which assaulted the enemy's position on the 8th of September 1855." He also received the medal and clasps. On the resignation of General Barnard, in November 1855, he became chief of the staff of the Eastern army. He was, 1857-59, M.P. for East Norfolk; he has since served in India; and in 1865 was made K.C.B.

WINDHAM, WILLIAM, was born on the 3rd of May 1750, in Golden-square, London, and was the only son of Colonel William Windham, of Felbrigg in Norfolk. The Windhams had been settled in Norfolk ever since the 11th or the beginning of the 12th century, and took their name from the town of Wymondham (pronounced Windham), where they resided till the middle of the 15th century, when one of Mr. Windham's ancestors purchased the property at Felbrigg. Mr. Windham lost his father when he was only eleven years old. He had been placed at Eton at the age of seven, and was continued there till he was sixteen years old. His guardians, who were Dr. Daupier (then under-master at Eton and afterwards dean of Durham), Garrick the actor, Mr. Price of Hereford, and Dr. Stillingfleet. He was then sent for a year to the University of Glasgow, where he applied himself with great diligence to the study of mathematics, a study for which he retained his fondness through life, and pursued even in his later life. In September 1767 he was entered as a gentleman-commoner at University College, Oxford. He left Oxford in 1771, having in the meantime refused an offer from Lord Townshend, an intimate friend of his father's, who appointed Lord-lieutenant of Ireland, to go with him to Ireland as his private secretary. At this period of his life so marked was the future statesman's indifference to politics, that, as we are told by Mr. Amyot, his biographer, on Mr. Windham's own authority, it was a standing joke of one of his contemporaries, that 'Windham would never know who was prime minister.' On leaving Oxford, Mr. Windham went abroad. In 1773 he joined an expedition of discovery then setting out, under the command of Commodore Phipps (afterwards Lord Mulgrave), towards the North Pole. Illness however obliged him to land on the coast of Norway, and to forego the expedition.

Mr. Windham's first appearance as a public speaker, and in connection with politics, was at a county meeting held at Norwich, on the 28th of January 1773, in order to set on foot a subscription in aid of government, for carrying on the war with the American colonies. Lord Townshend having proposed, and the Hon. Henry Hobart, brother of the Earl of Buckinghamshire, having seconded the opening of a subscription, Mr. Windham came forward strenuously to oppose it, and to denounce the conduct of the American war. Two years after, the interval having been passed by Mr. Windham almost entirely abroad, the memory of this speech led to his being put in nomination, in his absence and without his knowledge, for the city of Norwich, in the general election of 1780. He happened to arrive at Norwich, on his return from abroad to Felbrigg, being ignorant of the use which

Digitized by Google

had been made of his name, three days before the poll commenced. He then entered heartily into the contest, but he was not elected; though his position on the poll was, under all the circumstances, so satisfactory as to induce him to reserve himself for Norwich on a future occasion.

In 1782 he declined an offer to allow himself to be put in nomination for Westminster whenever a vacancy should arise. After his return from abroad, and his unsuccessful contest for Norwich, he lived principally in London, mixing much in literary and political circles. He was a member of the celebrated Literary Club, of which Johnson and Burke were leading members. His political sympathies were with Burke and Fox, and generally with that section of the then opposition which owned Lord Rockingham for its leader. On the formation of the coalition-ministry in 1783, of which the Duke of Portland was the nominal head, and Fox and Lord North were the most conspicuous members, Mr. Windham received the appointment of chief secretary to the Earl of Northington, who was appointed Lord-Lieutenant of Ireland. Mr. Windham however resigned his office in August of the same year. It is stated in Hardy's 'Memoirs of the Earl of Charlemont,' that the reason of his resignation was a distribution of patronage by Lord Northington in favour of the old court party, and in opposition to the views of Lord Charlemont and the Whigs in Ireland. The coalition-ministry was itself at an end before the close of the year 1783. In March of the succeeding year Mr. Pitt dissolved parliament, and Mr. Windham again contested Norwich, and this time with success.

Mr. Windham made his first speech in parliament on the subject of the Westminster scrutiny, on the 9th of February 1785. The particular motion was, to order the high bailiff to make an immediate return: it was opposed by Mr. Pitt, to whom Mr. Windham replied, and he was followed by Mr. Fox, who congratulated the House on "the accession of the abilities they had witnessed." Mr. Windham was appointed one of the managers of the impeachment of Warren Hastings, the particular charge intrusted to him being the breach of a treaty made with the Nabob Fyzoola Khan in 1774, after an invasion of his territories by the Company's troops, and the payment by the Nabob of the sum of 150,000*l.* on ratifying the treaty. On the Regency questions which arose in 1788 on the king's illness, Mr. Windham took a decided and zealous part in favour of the hereditary right of the Prince of Wales to the Regency, and against any restrictions on his power. When this parliament (Mr. Windham's first parliament) was dissolved in June 1790, he had already acquired a ripe political reputation.

Mr. Windham was again elected for Norwich in the new parliament. In the division of the Whig party, which was shortly after caused by the events of the French Revolution, he took part with Mr. Burke, Lords Fitzwilliam and Spencer, and the Duke of Portland, and zealously supported the war with France. In 1794, the Duke of Portland, Lords Spencer and Fitzwilliam, and Mr. Windham joined Mr. Pitt's cabinet. Mr. Windham receiving the appointment of secretary-at-war. He held this office until February 1801, when he resigned, together with Mr. Pitt, Lord Loughborough, Lord Grenville, Lord Spencer, and Mr. Dundas, because the king would not consent to the measures for the relief of the Roman Catholics in Ireland, which they considered indispensable to the success of the legislative union. During the seven years that Mr. Windham had been in office, he had introduced many useful reforms into the administration of the army. On the 15th of July 1798 he had married Cecilia, a daughter of Admiral Forrest, a very gallant and distinguished officer; and this marriage added much to the happiness of his life.

Mr. Addington was placed at the head of the new administration, which immediately applied itself to bringing the war to a termination, and in the autumn of 1801, during the prorogation of parliament, arranged the preliminaries of the peace of Amiens. Mr. Windham took a very prominent part in opposing this peace. On the 13th of May 1802, he moved an address to his majesty, deploring the sacrifices which had been made by the treaty, and the increase of territory and power which it had confirmed to France; a similar address was moved in the House of Lords by Lord Grenville. The address was rejected in both Houses by overpowering majorities. Mr. Windham's course with reference to the peace of Amiens led to his rejection at Norwich, on the dissolution of parliament in the summer of 1802. An attempt was made, on his being defeated at Norwich, to bring him forward as a candidate for the county of Norfolk, and a subscription was immediately set on foot by his friends to effect this object; but Mr. Windham declined the offer, and, through the interest of the Grenville family, he was elected for the borough of St. Mawes.

The peace of Amiens was not long-lived: after the renewal of the war in 1803, Mr. Addington's administration, which had begun with general support in parliament and with the confidence of the country, was suddenly shaken materially. Mr. Pitt and Mr. Fox had both advocated the peace of Amiens, and the former especially had given Mr. Addington effective support at the outset of his administration. But when the war broke out again, a general opinion prevailed that the ministry was incompetent to carry it on: and both Mr. Pitt and Mr. Fox joined, and by their influence largely increased, an opposition that had been before confined to the small party led by Mr. Windham in the House of Commons and by Lord Grenville in the House of Lords. A series of divisions, on questions all more or less relating to the conduct of the war, in which the minister's majority gradually dwindled down to an exceedingly small one, caused Mr. Addington's resignation in April 1804. Mr. Pitt was commissioned by the king to form a new ministry, and endeavoured to form one which should comprise Mr. Fox as well as Lord Grenville and Mr. Windham. But the king would not hear of Mr. Fox's name: and on Mr. Pitt yielding to the royal objection to that statesman, Mr. Windham and Lord Grenville refused to join his ministry.

Mr. Windham was now again united in opposition with his old political friend and the friend of his schoolboy days, Mr. Fox, against a ministry formed exclusively out of Mr. Pitt's old connection. The death of Mr. Pitt in 1806 brought him into office, in Lord Grenville's administration of the Talents, when Mr. Fox was made foreign secretary, and Mr. Windham secretary for the war and colonial departments. He applied himself diligently, on entering office, to the consideration of the best means of increasing the military force of the country: and on the 3rd of April 1806, he opened his views on this question at great length to the House of Commons, in moving for leave to bring in a bill to repeal the Additional Force Act. His chief object was to better the condition of the soldier, and make the army a more inviting profession. The object of repealing the Additional Force Act was to remove the obstacles created by its high bounties to the ordinary recruiting service. Mr. Windham's various particular proposals for increasing the pay and pensions of officers and soldiers, and for shortening the time of service, were carried into effect by large majorities. Mr. Windham's period of office ended on the 25th of March 1807, when the administration of the Talents came to an end, owing to a disagreement with the king on the subject of a proposal to give the Roman Catholics privileges in the army. Mr. Windham had shortly before declined an offer of a peerage, and at the general election in the preceding autumn had been returned for the county of Norfolk, but having been petitioned against, and having lost his seat for that county on petition, had taken his seat for the borough of New Romney, for which place he had also been elected.

The new ministry again dissolved parliament; and, by the interest of Lord Fitzwilliam, Mr. Windham was now chosen for Higham-Ferrers. In the session of 1808 Mr. Windham strongly denounced the expedition against Copenhagen, and, in the subsequent session, the ill-fated Walcheren expedition. On the resignation of Lord Castlereagh and Mr. Canning, after the failure of the Walcheren expedition, and on the consequent offer of Mr. Perceval to Lords Grey and Grenville, which they ultimately declined, there was a proposal of Mr. Windham's return to office, which he contemplated with no pleasure. He thought his health scarcely equal to the labour, and he feared that he should not be allowed to carry out the measures which he thought the state of the army absolutely required. He wrote, "I feel but little stomach to return to office, unless I can have *carte blanche* as to my military plans; and even then the whole is so *be-derailed*, that there is no restoring things to their original state." His health had much to do with this disinclination for official life. He had been for some time past a constant sufferer from rheumatic apoplexies. In May 1810, he found himself afflicted with a large tumour in the hip, which, having been neglected till then, caused him much alarm, and ultimately brought on his death. In July of the preceding year he had, on his return home one evening, seen a house on fire in Conduit-street, dangerously near to that of his friend Mr. Frederick North, who was at the time abroad, and whose valuable library was thus threatened with immediate destruction, and had given most zealous assistance in carrying away Mr. North's books, succeeding in saving about four-fifths of them before the house was consumed. During his exertions he fell and hurt himself in the hip; and that was the origin of the tumour. In May 1810, it was found necessary that he should undergo an operation for the extraction of the tumour. The operation was performed on the 17th of that month; at first everything went on well, but symptomatic fever afterwards came on, and he then grew daily worse, until the 3rd of June, on which day he died.

Mr. Windham has left behind him a reputation not so brilliant as those of his contemporaries, Pitt, Fox, and Burke, yet one which is generally associated with theirs, and not unworthy of the association. He was a refined and highly cultivated mind, and if his eloquence had not the power or force to make it, as Mr. Canning justly said, "the most commanding" they had ever heard in the house, it was "the most insinuating." His political life was marked throughout by a high sense of honour; and if his opinions may in some respects have erred, on the side of moderation, as for instance on the subject of Parliamentary Reform, which, first and last, he opposed, he had always the courage to avow opinions which placed him in opposition to those with whom he usually acted, and exposed him to popular disapprobation. He was an accomplished scholar and mathematician. Dr. Johnson, writing of a visit which Windham paid him, says, "Such conversation I shall not have again till I come back to the regions of literature, and there Windham is 'inter stellas luna minores.'" In a word, Mr. Windham has been described, and the description has been generally adopted as appropriate, as a model of the true English gentleman.

His speeches have been collected and published in 3 vols. 8vo, with a Life prefixed, by Mr. Thomas Amyot, who was for some years his

Digitized by Google

private secretary: and in 1866 appeared his Diary of the last 26 years of his life (1784 to 1810) edited by Mrs. H. Baring.

* WINER, GEORG BENEDICT, ecclesiastical counsellor and professor of theology in the University of Leipzig, was born at Leipzig, April 13, 1789. He studied in the Nicholaischule and the university of that town, in the latter of which he passed his examination in 1817. In the following year he became professor extraordinary of theology, and received the degree of D.D. from the Universities of Halle and Rostock. His scientific studies were at first directed to the yet but little explored critical and exegetical examination of the oriental translations of the Bible, and then turned his attention to an investigation of the exegesis of the New Testament, grounding it firmly upon a knowledge of the language. In his 'Biblische Realwörterbuch' (Dictionary of Biblical Matters), 1820, particularly in the second and third editions of 1833 and 1845-47, will be found an abundant mine of acute, learned, and trustworthy disquisitions. In his expositions of the 'Ad Galatum Epistola' (Epistle to the Galatians), 1821, he applied G. Hermann's philosophical principles to the language of the New Testament. The other fruits of his labours in this province are 'Grammatik des biblischen und targumischen Chaldäismus,' 1824; 'Chaldäisches Lesebuch,' 1825; his preparation of Simon's 'Lexicon manuale hebraicum,' 1828; his excellent 'Grammatik des neutestamentlichen Sprachidioms,' 1822, which has gone through several editions; and several of his vacation programmes, written at Erlangen, whither he was called as professor of theology in 1823, on account of his reputation as a teacher, and of his widely-extended writings. In 1824 he published his 'Comparative Darstellung des Lehrbegriffs der verschiedenen christlichen Kirchenparteien, nebst Belegen aus ihren symbolischen Schriften' (Comparative Description of the Systems of the various Sects of Christian Church Creeds, with Documents out of their Symbolical Writings), and in 1825 the 'Handbuch der theologischen Literatur, hauptsächlich der protestantischen Deutschlands' (Handbook of Theological Literature, principally that of Protestant Germany); to which a supplement was issued in 1842, 'Die Literatur von 1839 bis Ende 1841.' After having declined the professorship of theology in the University of Jena, he returned in 1832 to Leipsig as professor of theology in that University, taking the second place. In 1840 he issued the first part of his work 'De verborum et præpositionibus compositorum in Novum Testamentum usu.'

WING, VINCENT, an English astronomer of the 17th century, enjoyed some reputation during his life; and his writings, at the time they were published, possessed a certain value. Neither the year of his birth nor of his death is known.

He is principally distinguished by his work (in Latin) entitled 'Astronomia Britannica,' which was published in London in 1669. This is divided into five parts, of which the first is designated 'Logistica Astronomiæ;' the second, 'Trigonometria;' the third, 'Doctrina Sphærica;' the fourth, 'Theoria Planetarum;' and the fifth, 'Tabulæ Astronomicæ:' to these is added a collection of astronomical observations. His theory of the planets is founded on the systems of Copernicus and Kepler, for he supposes the orbits of the planets to be ellipses, and the sun to be placed in a common focus with Ball-like Bullialdus and Dr. Seth Ward, he considers the other focus of each orbit to be the centre of the planet's mean or uniform motion.

The transit of Venus, which had been observed by Horrox and Crabtree in 1639, indicated that the sun's parallax did not exceed a few seconds, but the evidence which it afforded was not, by some astronomers, at that time considered conclusive; and Wing, who supposed that the parallax was equal to one minute (more than seven times as great as it is in reality), endeavoured to account, from the effects of refraction, for the smallness of that which was obtained from the observation alluded to. The astronomical observations in the work consist of several longitudes of the sun at the times of the equinox, transits of Mercury over the sun, and eclipses of the sun and moon, ancient and modern: among those of the sun there is mentioned one which was observed in 1652; and it is stated that at the time when the eclipse should have been total, the moon was surrounded by a luminous crown *within which it appeared to turn on its centre like a millstone.*

The 'Logistica Astronomica' contains a table of logistic logarithms, with precepts for their use; and in the 'Trigonometria' are rather complicated demonstrations of the theorems for plane and spherical triangles.

In the year 1651 Wing published (in English) a work entitled 'Harmonicon Cœleste, or the Harmony of the Visible World, containing an absolute and entire piece of Astronomie.' It is similar in its arrangement to the 'Astronomia Britannica' above mentioned, but it contains some subjects which are not in the latter; and among these may be cited his refutation of the ancient opinion that the planets are attached to solid and transparent spheres. He objects to the opinion on the ground that if it were just the comets could not pass without impediment from one part of the solar system to another, and that the spheres would produce great refractions in the light which is transmitted to the earth from the fixed stars. The work contains a table of the logarithms of the ten thousand first numbers, and also of the sines and tangents of angles for every minute of the quadrant. He appears to have criticised the 'Astronomia Carolina,' which was published by Street in 1661, for the latter replied in 1667 to his animadversions in a work containing, as appears in the title, 'a castigation of the envy and ignorance of Vincent Wing;' the points in dispute between the two astronomers are however in the present age quite destitute of interest.

Wing was the author of a series of Ephemerides for thirteen years, viz. from 1659 to 1671 inclusive; and he published annually for the Stationers' Company a book and a sheet almanac, the latter of which is still continued under his name.

WINGATE, EDMUND, a younger son of Roger Wingate, a landed proprietor in Yorkshire and Bedfordshire, was born in Yorkshire in 1593, entered of Queen's College, Oxford, in 1610, from whence, after his degree, he removed to Gray's Inn. Here he mixed mathematical studies with his legal ones, and became well known in the former sciences. In 1624 he removed to France, where he spent some years, and seems to have been about the court: he taught English to the Princess Henrietta Maria and her ladies. By the time the troubles broke out he had inherited some property in Bedfordshire; he took the Covenant, was justice of peace, recorder of Bedford, and held other offices. In 1650, or thereabouts, he took the oath called the Engagement, became known to the Protector, and served in parliament for the county of Bedford: he was also one of the commissioners in that county for the detection and ejection of those ministers and schoolmasters who were called loyal by one party and ignorant and scandalous by the other. He was buried at St. Andrew's in Holborn, December 13, 1656.

Wingate's writings have generally only the initials E. W., with the description 'of Gray's Inn' sometimes appended. Hence several works which have only initials have been attributed to him: thus Wood makes him the author of Wyberd's 'Tactometria.' There are several legal writings, of no note whatever, by 'E. W. of Gray's Inn,' who is supposed to be Wingate.

It has been said that Wingate was the first who carried logarithms into France, which is not correct; and some of those who have amended the error state it was the sliding rule which he took there, which is equally incorrect. He did, in 1624, introduce into that country Gunter's scale, in his 'Construction, Description, et Usage de la Règle de Proportion,' Paris, 1624, dedicated to the Duke of Anjou. He did intend to publish a table of logarithms, to which the preceding was to have been an appendix, and he obtained the 'privilège du roi' for both works in one, dated November 4, 1624. But an advocate of Dijon, to whom he had communicated the account of Gunter's rule, broke confidence, and either published, or was going to publish an account of it; whereupon Wingate altered his first intention, published the account of the scale in 1624, as above noticed, and followed at leisure with the 'Arithmétique Logarithmetique,' Paris, 1626, which last work is, by an easily explicable mistake, often set down as of 1624. Besides this, the English tables of 1652 and 1658 attributed to Wingate, he published on the same subject 'Lndus Mathematicus,' London, 1654, a kind of logarithmic game; also a translation of his earlier Frooch work, 'The Use of the Rule of Proportion,' London, 1645; also a translation (probably) of the descriptive part of the second French work, 'Construction, Description and Use of the Logarithmetiall Tables,' London, 1635.

The work by which Wingate is best known is his 'Arithmetic,' of which the first edition (according to Wood) was in 1630. Of this work Kersey published an edition during Wingate's lifetime, at his request, the sixth edition of the work, which is also Kersey's, was in 1673. Shelley published another edition in 1720, and Dodson another in 1760. Wood attributes to Wingate a work on surveying: we suspect he is here confounded with Wing.

WINRAM, JOHN, an ecclesiastic, whose name occurs very frequently in connection with the history of the Reformation in Scotland, but whose real influence in the struggle was not so great as to entitle him to more than a brief notice. He took the degree of B.A. at St. Andrews in 1515. In 1536 he was subprior of the monastery of St. Andrews. His first public appearance was at the trial of George Wishart [WISHART] where he preached before the judges, a singular duty for one who is said to have embraced the doctrines of the Reformation, and as singularly performed by his preaching, as appropriate to a trial for heresy, from the parable of the wheat and the tares, "Let both grow together until the harvest." He evidently seems desirous to hold office in the Roman Catholic Church, till the parliament of 1560, where, though sitting as prior of Portmoak, he appears to have voted for the 'Confession of Faith' which was then passed. On the establishment of the new polity in 1561, he was appointed superintendent of the eastern districts. His influence in the new church was very considerable, but it appears to have been merely that of a dexterous intriguer, who knew when and how to the best effect to remove his support from a party who could not sufficiently reward his services. Knox, while accepting his aid, seems always to have distrusted him. He died on 28th September 1582.

WINSLOW, JACQUES-BÉNIGNE, was born at Odensee, a town in Denmark, in the island of Fünen, on the 9th of April 1669: his father was a Lutheran minister in the parish of Odensee. Winslow was destined for the church, and early commenced his studies in Lutheran theology. He however changed his mind and took to the study of medicine, and obtained a pension from the king of Denmark for the purpose of enabling him to study in the principal universities

Digitized by Google

of Europe. He first went to Holland, where he studied for some time, and in 1698 he arrived in Paris. Here he became a pupil of the celebrated Duverney, who encouraged his taste for the study of anatomy. He pursued his medical studies without any other interruption than an occasional discussion on the subject of religion with a young Dane. Winslow for the sake of argument assumed the principles of Romanism, and, to render himself more skilled, purchased Bossuet's 'Exposition of the Doctrine of the Church.' This work led him seriously to question his own principles as a Protestant, and as a consequence he had recourse to Bossuet, who was then bishop of Meaux, to solve his difficulties. This happened at a time when Louis XIV. was doing all that he could to bring back the Protestants into the bosom of the Church; Bossuet, and indeed almost every one of the young student of anatomy was induced publicly to recant and enter the Roman church. This appears to have been an act of conviction on the part of Winslow; if he expected to derive any advantage from it in Paris, he forfeited all in Denmark, and from thenceforth was expatriated. The Bishop of Meaux however became his patron, and he accordingly proceeded to take his degree from the Faculty of Medicine in Paris, which he did in 1705, not however until after the death of his benefactor, who died in 1704. He had by this time rendered himself favourably known by his exertions. In 1707 he was admitted a student of the Royal Academy of Sciences of Paris, and afterwards an associate. About this time he also assisted Duverney in his lectures on anatomy and surgery in the Jardin du Roi. He himself succeeded to this position, but not till after the death of Dionnis, who was successor to Duverney, which occurred in 1743. Eleven years previous to this, Winslow had published his great work on human anatomy, with the title 'Exposition Anatomique de la Structure du Corps Humain,' 4to, Paris, 1732. This work obtained for him at once a great reputation, and placed him among the best anatomists of his day. This work is not more remarkable for its embracing the labours of others, and the clear manner in which the matter is arranged, than it is for the amount of original observation which it contains. In the introductory chapters to the description of each system of organs, he gives a brief view of their functions, and in this department of science his judicious observations did much to prepare for subsequent discoveries, especially with regard to the functions of the muscular system. The 'Exposition' has often been republished. It was translated into English, and published in London as early after its publication as 1733; it was also translated into Latin, German, and Italian; and is the model on which most of our text-books on human anatomy have since been constructed.

Some of Winslow's biographers state that he was twice nearly buried alive, by failing into a state of only apparent death. This induced him to take up the subject of the signs of certain and uncertain death, and the result of his researches he published in 1740, in an answer to the question "An mortis incertæ signa minus incerta à chirurgicis quàm ab aliis experimentis?" This treatise was translated into French, and published in two volumes, 12mo, at Paris, in 1742. In this work the author has brought forward a number of cases of persons buried, opened, and otherwise treated as dead, who were only apparently so, and arrives at the conclusion that nothing but the indication of decomposition of the body going on is sufficient evidence of death.

In addition to his other appointments Winslow was made expounder of the Teutonic languages at the Royal Library of Paris. He was an active member of the Royal Academy, and published several papers on various subjects in their Memoirs. He practised medicine in Paris, but was remarkable for the timidity with which he prescribed, and is said never to have ordered a powerful dose of medicine without trembling. It has often happened in the history of medicine that those who have studied the human frame in detail have been afraid to treat it as a whole, and some of the best anatomists have been the worst practitioners. Winslow lived to the age of ninety-one, having died on the 3rd of April 1760.

* WINSLOW, FORBES, M.D. [vol. vi. col. 1034.]

WINSTON, THOMAS, was born in 1575. He received his education at Clare Hall, Cambridge, of which he became a Fellow. He took his degree of Master of Arts in 1602. Having determined on studying medicine, he visited the Continent, and attended the lectures of the most celebrated men of the day. He became a pupil of Fabricius ab Aquapendente, also of Cæsar Basilio of Bassi, and of Prosper Alpinus at Padua. He took his degree of Doctor of Medicine at Padua, and returned to London to practise his profession in 1607. He was then admitted a Licentiate of the College of Physicians, and became a Fellow in 1613. On the death of Dr. Mounsell, in 1615, he was appointed professor of anatomy at Gresham College. It was here he delivered those lectures on anatomy which after his death were published, and were for a long time considered the best text-book for students of anatomy. He obtained permission from the House of Lords to leave the country during the troubles of 1642, and returned after an absence of ten years. He died on the 24th of October 1655.

WINT, PETER DE, was born at Stone, in Staffordshire, in 1784. He was apprenticed to Raphael Smith, the mezzotinto engraver, and had for a fellow pupil, Hilton, the academician, whose sister he afterwards married. Abandoning engraving, Mr. De Wint adopted painting in water-colours as his line of art; and was elected a member of the Society of Painters in Water-Colours, in 1810, six years after its foundation. For nearly forty years his pictures were among the leading attractions of the annual exhibitions of that society. He painted almost exclusively home scenery:—Views in Kent, Lincolnshire, &c.; among the lakes and mountains of Cumberland, Westmoreland, and Wales; on the Thames, the Wye, and other rivers; corn-fields, hay-fields, water-mills, and the like, being especial favourites with his pencil. His style was broad, bold, and vigorous, his colour fresh; and in general effect his pictures represented with fidelity the ordinary aspects of English scenery. But he was wanting in refinement, and in aiming at breadth of effect he was often negligent of details. His touch and texture were peculiar; but, allowing for an almost inevitable mannerism, very agreeable and effective. Avoiding all the methods adopted by the younger generation of water-colour painters for producing force and brilliancy, he to the last continued to paint according to the method of the founders of the English school with washes of transparent colours only, but in that he thus took in power and variety he, to some extent, made up in clearness and freshness. He died on the 30th of June 1849, in his sixty-sixth year.

WINTER, JAN WILLEM VAN, was born at the Texel in 1750. He entered the naval service of Holland in 1762, and soon distinguished himself by his zeal and courage. He was still only a lieutenant in 1787, when the Revolution broke out in Holland. He attached himself to the popular party, and the adherents of the Stadtholder having gained the ascendancy, he was obliged to fly to France. He entered the French army; served with distinction under Dumouriez and Pichegru, in the campaigns of 1792 and 1793, and was promoted to the rank of general of brigade. Van Winter returned to Holland in 1795, when the republican army under Pichegru invaded that country. The state-general invited him to re-enter their navy, and offered him the rank of rear-admiral. Next year he was promoted to be vice-admiral, and placed in command of the Texel fleet.

After being kept in port for a considerable time by a superior blockading force, he evaded its vigilance, and put to sea, intending to join the French armament at Brest, on the 7th of October 1797, at the head of twenty-seven armed vessels, consisting of which were ships of the line. At nine o'clock in the morning of the 11th, he found himself in presence of the English fleet under Admiral Duncan, which consisted of sixteen ships of the line and a number of smaller vessels. The action commenced about twelve o'clock, and continued for three hours and a half. The Vrijheid (74 guns), Van Winter's ship, engaged with three English vessels, and struck to Vice-Admiral Onslow, after losing all its masts and half of its crew. The Dutch lost in this action nine ships of the line, taken or sunk, 600 men killed, and about 1,200 wounded. The loss on the side of the victorious English was scarcely less severe.

Van Winter was received in England with the respect due to a brave man. He was liberated by exchange in a few months, and, on the 11th of October, the court-martial commissioned to examine into his conduct declared that he had maintained the honour of the flag of the Batavian republic. The despatch in which Admiral Duncan gave an account of the action bears testimony to the obstinate valour with which both Van Winter and his second in command ('Vice-Admiral Reyntjes) fought their ships:—"The change on board the two ships which bore the admirals' flags has been beyond all description."

He was sent in the capacity of minister-plenipotentiary to the French government in 1795, and retained the appointment till 1802, when he was recalled to take the command of the Dutch fleet. The only memorable event that marked his period of command was the termination of the differences between Holland and Tripoli by his management. Louis Bonaparte, when king of Holland, reposed entire confidence in Van Winter, whom he created Count of Huesca, marshal of the kingdom, and commander-in-chief both of the sea and land forces. Napoleon, after he incorporated Holland in the empire, treated him with equal favour, made him grand officer of the Legion of Honour and inspector-general of the shores of the North Sea. In July 1811, Van Winter was appointed to command the naval force assembled at the Texel. A severe attack of sickness forced him to leave the fleet for Paris, where he died on the 2nd of June 1812. He was buried in the Parthenon, with all the ceremonies usually observed at the obsequies of the great dignitaries of the empire; M. Marren delivered the funeral oration.

WINTER, PETER VON, chapel-master to the king of Bavaria and knight of the Order of Marit, was born at Mannheim in 1755. His father, a brigadier in the Palatine Guards, observing his son's genius for music, placed him with the court musician, Mair, from whom he learned the rudiments of the art. His instrument being the violin, he completed his studies as a performer under William Cramer (the father of J. B. and F. Cramer), who was first violin at the court of Mannheim from 1750 to 1770. With this excellent master he made such progress that he became a performer in the elector's orchestra at the age of ten, and speedily distinguished himself on other instruments. It has been generally supposed that Winter studied composition under the Abbé Vogler. He always denied this however, and in a manner which indicated a strong dislike of the abbé. He certainly had an opportunity of acquiring information from Salieri of Vienna but it is probable that he was more indebted to his own

Digitized by Google

penetrating mind, directed to a careful examination of the scores of the great contemporary masters, to which he devoted much time, for his knowledge, then to the instruction of any individual teacher. In 1776, when Lessing carried into effect the establishment of a German opera at Mannheim, Winter was chosen director of the orchestra. He now first attempted composition, and all his early efforts decidedly failed, and he destroyed them nearly as soon as they were written. In 1780 appeared his first complete opera, 'Helena und Paris,' and this was followed by 'Bellerophon.' He had brought out three ballads on the Vienna stage; but now Salieri, by a significant friendly hint, induced him to listen and study more, and to write less. We therefore do not fear of his having produced anything worthy of notice till 1791, when he proceeded to Italy, and at Naples composed 'Antigone,' also the 'Fratelli Rivali,' as well as the 'Sacrifizio di Crete,' for Venice. From 1794 to 1796 he resided at Vienna, where he produced some of his most effective works, and among these 'Das Unterbrochene Opferfest' (The Interrupted Sacrifice), the *libretto*, or text, of which was furnished by Huber. From 1796 to 1800 Prague was his place of residence, where he brought out 'Il Trionfo del Bel Sesso,' and 'Maometto.' He was then invited to undertake the direction of the opera at Munich, for which he wrote his 'Maria von Montalban.' Between the years 1803 and 1805 he was in London, and gave at the King's Theatre his three finest works—'Calypso,' 'Il Ratto di Proserpine,' and 'Zaira,' the chief characters in which were sustained by Mrs. Billington and Madame Grassini. Here he also brought forth the music of the grand ballet of 'Orphée,' composed in a style then new to the stage, uniting the energy and vivacity of pantomimic music with the chastened regularity of that of the drama. From London he proceeded to Paris, and gave his 'Tamerlane' at the Academie Royale de Musique with great success. He there was persuaded to reset Quinault's 'Castor et Pollux,' originally composed by Rameau. Gluck long before had declined this dangerous task, and Winter by undertaking it drew down on himself a storm from the admirers of the ancient master which induced him to quit France. The same work was afterwards performed in London without success.

In 1814, the fiftieth year of Winter's service at the court of Bavaria, the king bestowed on him the honour of knighthood. In the same year he produced his Battle Symphony with a chorus, in celebration of the general peace; but this had only patriotic merits to recommend it. He now retired into privacy, and in 1818 he unexpectedly reappeared, and made a journey into the north of Germany, accompanied by the celebrated singer Madame Vespermann, giving concerts in most of the principal towns; and then proceeded to Milan, where he directed the performance of 'Semiramide,' recently composed by him, into which he breathed all his youthful spirit. In addition to this, he, the following year, got up in the same city two other operas. His last work for the stage was a comic piece, 'Der Sänger und der Schneider' (The Singer and the Tailor), which long continued a favourite on the German lyric theatres. He however continued composing for the Church up to the very period of his decease, which took place at Munich, October 17, 1825.

Winter's muse was very prolific. His German biographer gives a list of nine masses and other sacred works, forty-one operas for the theatre, twelve for the chamber, twelve symphonies and other instrumental pieces, many sets of cantatas, canzonets, together with numerous detached compositions, all of which he produced five years before his death; and to these are to be added others written subsequently to those enumerated. His early works do not exhibit much genius; but as he advanced in life his mind became gradually more vigorous, and at length developed a power which entitles him to be ranked very high as a composer for the stage and for the orchestra.

* WINTERHALTER, FRANZ XAVIER, was born in 1806, at St. Blasien, in Baden; and was educated at Carlsruhe, whence he proceeded to Munich, where in 1823 he entered as a student the Academy of Art. Having passed through the usual course of study, and made a visit to Italy, he commenced the practice of his profession. Although he has painted both historical and poetic subjects, his pencil has been chiefly devoted to portraiture, in which he has probably found higher and more ample patronage than any other painter of the day. Besides many of the German kings and princes, he had the good fortune to win the favour of Louis-Philippe of France, and Victoria of England, as well as her Consort. For some years past he has indeed been the favourite court painter. He has painted the Queen and the Prince Consort a great many times, and he has also painted all the younger members of the royal family; as well as portraits of Wellington and Peel for her Majesty, and many other royal commissions. Among the higher nobility he has also of course found numerous patrons. Not many of his works however have come before the general public. Besides a few royal portraits, the only work of importance which we recollect to have seen publicly exhibited was his 'Floride,' a somewhat opera-like rendering of the story of Frederick the Goth observing Florinda bathing in the Tagus, which appeared at the Royal Academy in 1852. At the Manchester Exhibition his state portraits of her Majesty and the Prince Consort, contributed by the Queen, attracted some notice, but alongside the portraits of Titian, Rubens, Rembrandt, Vandyck, Reynolds, and Gainsborough, his mincing style and overwrought conventionalism, were brought into somewhat unfair prominence. Herr Winterhalter belongs to a far lower class of portrait painters than the great men we have named, but though his touch is feeble and his colour affected, he is a careful artist; finishes his work smoothly and conscientiously, renders the court costume with scrupulous fidelity, colours gaily after the French fashion, and, if he does not succeed in imparting to his sitters a high degree of intellectual expression, or much force of character, seldom fails to depict an amiable and pleasing countenance. One of his best poetic pictures, 'Il Decamerone,' is in the collection of the Duke of Sutherland. Many of his royal pictures and some of his fancy subjects, have been engraved or lithographed. He has himself lithographed several works of modern German painters, and some of his own portraits.

* WINTHER, CHRISTIAN, or to give his name at full length, RASMUS VILLADS CHRISTIAN FERDINAND WINTHER, a Danish poet of high reputation, was born on the 26th of July 1796, at the country town of Fensmark in the island of Seeland. He lost his father, who was a clergyman, in 1808, but in his mother's second husband, Rasmus Møller, he found a second parent, and in Professor Martin Möller, who became her step-son by the marriage, a companion, who took the place of a brother. Rasmus Möller, who was afterwards bishop of Laaland and Falster, was a copious theological writer, his son, who died in 1838, became an eminent professor, and after his death a collection of his works was edited by Winther. The poet was himself intended for a clergyman, and in 1824 passed his theological examination at the university of Copenhagen, which he had entered in 1815 as a student, but he seems to have felt no inclination to the calling. After spending some years as a private tutor, the death of an uncle in 1829 put him in possession of the means of making a tour to Italy, where he passed ten months in the study of his language, poetry and literature. So early as when a student in 1819, he had written a song for the students which had remarkable popularity; he had afterwards inserted some lyrics in periodicals, and in 1828 had published his first volume of poetry, which met with a warm welcome. After his return from Italy, he issued occasional volumes of poems, which fixed his place as one of the first lyric poets of Denmark, and an annual pension of a thousand rix-dollars was assigned him by the Diet in 1853. The king had previously in recompense for his services in instructing the present Queen of Denmark in Danish, granted him the title of professor. The best edition of his numerous volumes of lyrics is that intitled 'Nye Digtninger,' 'New Poems' in 1853. He is also the author of several short novels which are in as high estimation as his poems, have run through several editions, and have been translated into German. For some time editor of the 'Danske Samlehad,' or 'Danish Art-Journal,' and he has also published 'Five-and-twenty Fables,' and other books for children, a translation of 'Reynard the Fox,' &c., &c. Like many other Danish poets he has also composed in German, but his 'Judith, a fragment of a large poem' in that language (1837) has little merit. Indeed a fragment during the lapse of twenty years. The most successful efforts of Winther are his poetical sketches, entitled 'Tresnit,' 'Wood-cuts,' which are admirable for their sharpness and truth to nature.

WINTRINGHAM, CLIFTON, father and son. The elder Wintringham practised as a surgeon at York, published several works which have obtained for him a reputation both as a physician and physiologist. His first work was on gout, and was published at York, with the title 'Tractatus de Podagra, in quo de ultimis et proximo patriis causis tractatur,' 8vo, 1714. In this work there are evident indications of his belonging to the mechanical school. He attributed gout to several causes, such as the acrimonious viscosity of the nervous liquid, the rigidity of the muscles, and a contraction of the diameter of the vessels near the joints. In 1718 he published 'A Treatise on Endemic Diseases.' This work consists of an analysis of the causes producing endemic diseases, and attributes them variously to a change of temperature, to prevailing winds, to the nature of the soil, to the influence of water and food, and particular climates. In 1729 he published a commentary on the epidemic diseases of York and its neighbourhood, with the title 'Commentarius nosologicum morbos Epidemicos et aëris variationes in urbe Eboracensi, locisque vicinis, ab anno 1715 ad anni 1725 finem grassantes complectens,' 8vo, London. This work is an admirable description of the diseases on which it treats. A second edition was published by his younger Wintringham in 1733. In 1740 he published in London 'An Experimental Enquiry on some Parts of the Animal Structure,' 8vo. These inquiries were principally directed to the vascular system and the functions of the eye. In 1743 he published a second physiological work, entitled 'An Enquiry into the Ability of the Vessels of the Human Body,' 8vo. In this work he has attempted to apply mathematical formulæ to the solution of physiological problems. But as the data upon which all the subsequent reasoning is based were mere assumptions, he came to no results of any importance; but these works, independent of their speculations, contain much accurate observation and valuable research. These works are often erroneously attributed to his son, and this error pervades most of the continental biographies. The elder Wintringham was a Fellow of the Royal Society, and died at York, on the 12th of March 1748.

WINTRINGHAM, CLIFTON, the Younger, was born at York in 1710, and was educated at Trinity College, Cambridge, and took his degree of Doctor of Medicine in that university in 1749. He afterwards

Digitized by Google

became a Fellow of the College of Physicians, and settled in London. In the same year he was appointed physician to the Duke of Cumberland, and in 1762 was made physician to George III., by whom he was knighted. In 1759 he was made physician extraordinary, and subsequently was appointed physician-general to the army. He was created a baronet in 1774, but the title has become extinct. He had a large practice, and was much respected both in public and private life. In 1752 he published some essays on various departments of medicine, under the title 'De Morbis quibusdam Commentarii,' 2 vols. 8vo. He also published an edition of his father's works, and edited Mead's 'Monita et Precepta Medica,' to which he added numerous annotations. There is a small marble bust of Æsculapius, which was found near Rome, in Trinity College, Cambridge, which was the bequest of Sir Clifton Wintringham. He died at Hammersmith on the 9th of January 1794.

WINWOOD, SIR RALPH, Knt., was born at Aynho, or Aynho-on-the-Hill, a village in the north-western corner of Northamptonshire, about the year 1564. His father, whose name was Richard, was the son of Lewis Winwood, who was at one time secretary to Charles Brandon, duke of Suffolk. Winwood was educated at Oxford, where he was first admitted of St. John's College, but was in 1582 elected probationer-fellow of Magdalen. He took his degree of B.A. in November of that year; that of M.A. in June 1587; and that of LL.B. in February 1590. In April 1592, he was chosen proctor of the university. He then spent some years in foreign travel. After his return home, Sir Henry Neville being, in 1599, sent as ambassador to France, Winwood was appointed secretary; and he was ultimately left for some time, during Sir Henry's absence, as resident at Paris. From this post he was recalled in January 1603, and was the same year sent on a mission by James I. to the States of Holland. He was knighted June 28th, 1607, and in August following he and Sir Richard Spence were together appointed ambassadors to Holland. In August 1609, he was once more sent as envoy to that country; and two years after he distinguished himself by the zeal with which he acted in the affair of the Arminian divine, Conrad Vorstius, whose appointment as professor of divinity at Leyden so enraged the English king, that he threatened to separate himself from the alliance with the States unless they deposed and banished the heretical doctor. Vorstius in fact was in the end obliged to resign his professorship, and to leave the country. When Winwood was recalled from Holland does not appear; but on the 20th of March 1614, he was made secretary of state; and he continued in that post till his death at London, on the 27th of October 1617.

The name of Sir Ralph Winwood has been preserved in our literature by a valuable historical collection, which was published at London in 1725, in 3 vols. folio, under the following title:—'Memorials of Affairs of State in the Reigns of Queen Elizabeth and King James I., collected chiefly from the original papers of the Right Honourable Sir Ralph Winwood, Knt., sometime one of the Principal Secretaries of State; comprehending likewise the negotiations of Sir Henry Neville, Sir Charles Cornwallis, Sir Dudley Carleton, Sir Thomas Edmonds, Mr. Trumbull, Mr. Cottington, and others at the Courts of France and Spain, and in Holland, Venice, &c. Wherein the principal transactions of those times are faithfully related, and the policies and intrigues of those Courts at large discovered. The whole digested in an exact series of time. By Edmund Sawyer, of Lincoln's-Inn, Esq., and one of the Masters in Chancery.'

WINZET, or WINGET, NINIAN, a Scottish ecclesiastic, is supposed to have been born in Renfrewshire in 1518, and to have been educated at the University of Glasgow. In 1531 he was incorporated in the grammar-school of Linlithgow, and soon afterwards, while he continued in that situation, he entered into holy orders. In 1561, on the establishment of the ecclesiastical polity of the Reformation, he was cited before the Superintendent of the Lothians, to answer for his religious opinions, when, adhering to the doctrine of the Roman Catholic Church, he was deposed from his office. In the following year he published 'Certane Tractatis for Reformation of Doctryne and Maneris, set forth at the desire and in ye name of ye afflicted Catholikis, of inferiour ordour of Scotland, Layik Men in Scotland.' The object of this work was one which few attempted in those days of fierce controversy—an internal reform in the Roman Catholic Church, as distinct from its severance from the Papal authority. At a later period in the same year, and after Knox had addressed against him some controversial arguments from the pulpit, he attempted to publish a work called 'The Last Blast of the Trumpet of Gode's Wordis against the usurpit auctoritie of Johne Knox, and his Calumiane brether, intrudit Precheouris,' &c., but the Protestants had not made sufficient progress in religious toleration to leave a free press at the disposal of their adversaries, and the copies of the work were seized in the printing-office. Winzet himself made a narrow escape, and the printer was imprisoned. The only fragment of this work which has survived to the present day is a copy of the first five leaves, preserved in the University Library of Edinburgh. Winzet now thought it prudent to take refuge in Flanders, and in 1563 he published at Antwerp 'The Buke of four scoir thre Questions, touching Doctrine, Ordour, and Maneris.' This is a controversial tract, in which, though complaining of the usage he had received from the reformers "for denying only to subscrive yair phantasie and fectioun of faith," there is an air of gentleness which seems to have been peculiar to the disposition of the author, and is not characteristic of the controversial writings of the times. Winzet affected to adhere to the older style of the Scottish language. He says to Knox, "Gif ze, throw curiositie of novatioris, hes ferzet our auld plane Scottis, quhilk zour mother lerit son, in tymes cuming I sall wryte to you my mynd in Latin;" yet Winzet's own style shows nearly as great a divergence from the Scottish of a century earlier as that of Knox, though the latter made a nearer approach to the English of the 16th century. In 1576 Winzet was appointed abbot of the Scottish monastery of St. James's, at Ratisbon. In 1582 he published 'Flagellum Sectatorium,' another controversial work, to which he appended an attack on the 'De Jure Regni apud Scotos' of Buchanan, which is one of the earliest works in which the spirit of free inquiry then in operation as to religion was extended to politics. Winzet died on the 21st of September 1592. (*Irving, Lives of Scottish Writers*, i. 98-101; *Memoir prefixed to Collection of Winzet's vernacular Works, printed for the Maitland Club.*)

WISE, MICHAEL, one of the most justly admired of our Church composers, was born in Wiltshire, and was among the first set of children of the Chapel-Royal at the Restoration. He was chosen as organist and master of the choristers in the cathedral of Salisbury in 1668. Seven years later he received the appointment of Gentleman of the Chapel-Royal; and in 1686 he added to his other offices that of almoner of St. Paul's Cathedral, including the mastership of the choristers. He was a great favourite of Charles II.; but it is said that, presuming too much on the notice of royalty, he incurred the King's displeasure, and was for some time suspended from his situation at court. He was a man, says Sir John Hawkins, of much humanity, and this, added to his high musical talents, may have recommended him to the favour of the 'merry monarch.' His end was tragical; for quitting his house at night in a state of great irritation, he was stopped by the watchman, with whom he entered into a quarrel, and was killed in the affray, August 1687.

The compositions of Wise are among the glories of our cathedral music. He added melody to science, and in setting sacred words displayed much judgment as genius. His anthems, 'Awake up, my Glory,' 'Prepare ye the way of the Lord,' and 'The ways of Zion do mourn,' have lost none of their charms by use or age, and are still listened to with admiration by all who hear them and whose feelings are attuned to church music of the most elegant and expressive kind.

WISEMAN, CARDINAL NICHOLAS, the son of a merchant of Waterford and Seville, was born at Seville on the 2nd of August 1802. His father's family long held large landed property, in the county of Essex, and still retain the baronetcy conferred on his ancestors by King Charles I. His mother was one of the ancient family of Strange, of Aylwardstown, in Tipperary, Ireland, and died in 1851, having seen her son invested with his present dignity. Having received his early education at Waterford and at St. Cuthbert's College, Ushaw, near Durham, he became one of the first members of the English College at Rome in December 1818, and was created D.D. in 1824. In 1825 he was ordained, and became successively professor of Oriental languages, and vice-rector of the English College, and in 1829 rector. He had already composed and printed his learned work, 'Horæ Syriacæ' from Oriental manuscripts in the Vatican. Returning to England in 1835, he gained much reputation as a preacher by a series of 'Lectures on the Doctrines and Practices of the Catholic Church,' delivered at the Sardinian Chapel, and afterwards published in 2 vols. 12mo. They were followed by his 'Treatise on the Holy Eucharist,' which occasioned a learned controversy with Dr. Turton, now Bishop of Ely, and his 'Lectures on the Connexion between Science and Revealed Religion,' which at once established his name as a theologian and a man of scientific acquirements. In 1840, on the increase of the Roman Catholic Vicars Apostolic from four to eight, Dr. Wiseman was appointed Coadjutor to the late Bishop Walsh of the Midland District (with the title of Bishop of Melipotamus in partibus), and at the same time president of St. Mary's College, Oscott. In 1848 he became Pro-Vicar Apostolic of the London District, to which he eventually succeeded in the following year on the death of Bishop Walsh, in August 1850. Bishop Wiseman was summoned to Rome, where in the following month, he was nominated by the Pope 'Archbishop of Westminster.' This, which was called by the Roman Catholics the restoration of the hierarchy in England, led as is well known, to a great deal of angry feeling in this country, and the papal assumption was met by the passing of the Act (14 and 15 Vict. cap. 60) 'to prevent the assumption of certain Ecclesiastical Titles in respect of places in the United Kingdom,' by which the use of such titles was made penal. The archbishop's territorial dignity has remained therefore in all respects an unsubstantial figment. At the same time that he was created archbishop he was invested with the dignity of a Cardinal Priest, taking his title from the ancient Church of St. Prudentia. He is the seventh English-man elevated to that rank since the Reformation. Cardinal Wiseman was one of the founders, and has long been joint-editor of, and a frequent contributor to, the 'Dublin Review,' in which first appeared his 'High Church Claims.' These and his other writings, which include 'Lectures on the Offices and Ceremonies of Holy Week,' 'Letters on Catholic Unity,' a 'Letter to the Rev. J. H. Newman on Tract, No. 90,' and other pamphlets, were republished in a collected form in 3 vols. 8vo, in

Digitized by Google

1853. Cardinal Wiseman has frequently lectured since that time before the literary societies of the Metropolis, and on behalf of public institutions, on various subjects connected with education, history, science, art, and literature. [*See* SUPPLEMENT.]

WISEMAN, RICHARD, lived in the 17th century; he became first known as a surgeon during the civil wars of Charles I., and was the companion of Prince Charles when a fugitive in France, Holland, and Belgium. He was afterwards a surgeon in the Spanish navy for three years, and returning to England, he was present at the battle of Worcester, where he was made prisoner. He was liberated in 1652, and then took up his residence in London. At the Restoration, Charles did not forget his old companion, and he was made sergeant-surgeon to the king. He was an observant judicious surgeon, and his publications on various diseases were read by the profession with much avidity. In 1676 he collected his various treatises into one volume, and published them with the title, 'Several Surgical Treatises on Tumours, Ulcers, Diseases of the Anus, Scrofula, Wounds, Gun-shot-wounds, Fractures and Luxations, and Syphilis,' 2 vols. 8vo. This work is remarkable for the honesty of the writer, in which, with a single eye to the advancement of medical science, he records everything that occurred, whether successful or unsuccessful, in the treatment of his cases. He suffered in early life for his attachment to royalty, and he will perhaps be excused on this ground, if his feelings are considered, for having advocated the efficacy of the royal touch in cases of scrofula. His works have always been considered valuable contributions to surgical knowledge, and the two volumes in which they are contained have gone through several editions.

WISHART, GEORGE, called 'the Martyr,' a champion of the Reformation in Scotland, is supposed to have been a son of James Wishart of Pittarrow, justice-clerk during the reign of James V. The time of his birth is not known. At the beginning of the 16th century he was master of a grammar-school at Montrose, where he introduced the study of Greek. Whether he ever took orders is a point undetermined. He began to diffuse the doctrines of the Reformation at Montrose, but becoming alarmed by the enmity which he roused, he fled to England. He preached the same doctrines at Bristol in 1538, but sterner measures seem to have been there adopted towards him, and he recanted and publicly burned his faggot. In 1543 he was at Cambridge. According to a notice of his character, appearance, and habits at that time by his pupil Emery Tylney, he "was a tall man, polde headed, and on the same a round French cap of the best. Judged of melancholye complexion by his physiognomie, black haired, long bearded, comely of personage, well spoken after his country of Scotland, courteous, lovely, loving, apt to teach, desirous to learne, and was well travailed." He is further described as charitable to the poor, and abstinent to the extent of austerity. In July 1543 he returned to Scotland along with the commissioners who had been sent to England to treat for a marriage between Prince Edward and the infant Queen of Scots. Protected by the heads of the Reformation party, he now preached with boldness and fervour in Dundee, Perth, Montrose, and Ayr, creating popular tumults, which ended in the destruction of several ecclesiastical edifices, and threatening the authorities with coming vengeance when they interfered with his proceedings. The timidity which attended him while he was an obscure propagator of his opinions, seems, now that he exercised a wide influence on the popular mind and filled a large place in the eye of his countrymen, to have been succeeded by a resolute spirit of defiance and a contempt of danger.

The view which the impartial narrator must take of Wishart's character has of late years been materially changed by the discovery of documents affording what is almost conclusive historical proof that he was engaged in plots against Cardinal Beaton's life. This charge, stated by two old Scottish biographical authors, Dempster and Dr. George Mackenzie, whose accuracy is justly doubted, was repeated in 1831 by a Roman Catholic historian (Carruthers, 'Hist. of Queen Mary,' p. 40), and has been amply illustrated from original documents by Mr. Tytler. In a series of letters, which show that there were several parties who were prepared to assassinate the cardinal, if they had the direct authority of Henry VIII. to perpetrate the deed, and his promise of protection and reward, one signed by the Earl of Hertford, Holgate, bishop of Lauduff, and Sir Ralph Sadler, and addressed to the king, dated 17th April 1544, has this passage: "Please it your highness to understand, that this day arryved here with me, the erll of Hertford, a Scotishman called Wyshert, and brought me a letter from the Larde of Brunstone, which I sende your highnesse herewith: and, according to his request, have taken order for the repayre of the said Wyshert to your majestie by poste, bothe for the delyvire of such letters as he hathe to your majestie from the said Brunstone, and also for the declaration of his credence, which, as I can perceyve by him, consisteth in two poyntes: one is that the Larde of Grraunge, late thesaurer of Scotlande, the Mr. of Rothes, the earl of Rothe's eldest son, and John Charters, wolde attempt eyther t'apprehend or slee the cardynal at some tyme when he shall pass through the Fyflande, as he doth sundrye times to Saint Andrewes," &c. It appears from these letters that Wishart had immediately afterwards an interview with Henry, in which he repeated the offer to put Beaton to death. The negociations were continued by Brunston and the Earl of Casillis, but were not quite satisfactory to either of them ,the king declining to authorise the assassination, or, as Sir Ralph Sadler said, "his highness, reputing the fact not meete to be set forward expressely by his majesty, will not seem to have to do in it, and yet not misliking the offer." In the end however the two persons whom Wishart represented as prepared to commit the murd-r, Kirkaldy of Grange and the master of Rothes, were the actual perpetrators of it. It remains of course a matter of doubt whether George Wishart 'the Martyr' was the same Wishart who was the vehicle of the proposal, but this doubt is much narrowed by the fact that the laird of Brunston was George Wishart's champion and familiar friend. It is believed that Beaton was aware of the plots against his life. Wishart had therefore probably good reason to predict danger to himself, and he was generally surrounded by armed friends, of whom Knox was one. While in Dundee he received an invitation from Cassilis and other Protestant barons to hold a disputation in Edinburgh. Repairing thither, he friends, probably through timidity, did not meet him. Unprotected however as he was, he preached in the neighbourhood, and then on the approach of the governor and the cardinal, fled to the laird of Brunston's house, four miles from Edinburgh. Ventring to preach in the town of Haddington, he took refuge with another supporter, Cockburn of Ormiston, in whose house he was seized by the cardinal's troops, and conveyed to St. Andrews. He was immediately put on trial for heresy before a special ecclesiastical council; Arran, the governor, having refused to give the proceeding the countenance of the civil power. He was condemned to be burned at the stake, and the sentence was executed at St. Andrews on the 28th of March 1546, amid the portentous murmurs of the people.

Among many unfulfilled prophecies traditionally attributed to Wishart was one, that Beaton should soon hang in ignominy from the same window whence he was witnessing the execution; and the circumstance above detailed shows that Wishart might perhaps have reasonably anticipated such an event without possessing the gift of prophecy.

(Mackenzie, *Lives of Scots Writers*, iii. 9-19; Tytler, *Hist. of Scotland*, vol. v.; Lyon, *Hist. of St. Andrews*, ii. 358-366; M'Crie, *Life of Knox*, period ii.)

WISHART, GEORGE, an ecclesiastic and biographical writer, is said to have been born in Haddingtonshire, in 1609, and to have studied in the University of Edinburgh. In 1639 he was a clergyman in St. Andrews, when, having to take the covenant, he was deposed from the ministry. On 28th January 1645, he is found petitioning the Scottish parliament as "sometymes at St. Andrews, and laitly at Neucastle, neu prisoner in the comon jayell of Edinburghe, beging maintinence, since he and his wyffe and 5 children were lyklie to dy for hounger." (*Balfour's Annals*, 1644.) He was several times imprisoned during the dominancy of the Presbyterian party. The approach of Montrose's army enabled him to join that commander, to whom he became chaplain. In 1647 he published his history of the wars of Montrose, with the title 'De Rebus sub Imperio Jacobi Moutierosarum Marchionis, anno 1644 et duobus sequentibus prreclare gestis, Commentarius.' On the execution of Montrose in 1650, this work was hung, in contumely, from his neck. It was reprinted at Paris in 1648, and acquired a high reputation for the elegance of its Latinity. It was translated into English in 1652, and the author is supposed to have been the translator. There is in the Advocates' Library a manuscript continuation of the work to the death of Montrose, which has not been published in the original Latin; but a translation of it was appended to a translation of the first part in 1720, and both were re-translated and published by Ruddiman in 1756. A new edition of this translation was published at Edinburgh in 1819. After his patron's death, Wishart became chaplain to Elizabeth, the Electress Palatine. At the Restoration he was made rector of Newcastle, and in 1662 was consecrated bishop of Edinburgh. Though he had himself suffered persecution, and in his writings vindicated the cruel acts of Montrose, he is said to have been averse to the intolerant policy of Charles II.'s government, and to have recommended leniency to the Covenanters. He died in 1671. (Keith, *Catalogue of the Bishops of Scotland*; Lyon, *History of St. Andrews*, ii. 10-12.)

WISTAR, CASPAR, was born at New Jersey, United States of North America, where his father was a glass manufacturer, in the year 1760. His father was a German emigrant, and a member of the Society of Friends, of which society Wistar remained a member. He was educated in Philadelphia at the school founded by William Penn, and commenced his medical education in that city. In 1782 he received the degree of Bachelor of Medicine in Philadelphia, and afterwards came to pursue his studies in Europe, and graduated in medicine at Edinburgh in 1786. His thesis was entitled 'De Animo demisso.' He returned to his own country in 1787; and when the college at Philadelphia was revived, he was appointed professor of chemistry and physiology, and he delivered the course of lectures on these subjects in 1789 and 1790. He was afterwards appointed to share the chairs of anatomy and surgery with Dr. Shippen, at whose decease the whole duties of these chairs devolved on him. He was successively appointed physician and consulting physician to the dispensary, and physician to the hospital, of Philadelphia. In 1816 he was elected president of the American Philosophical Society. He published several papers on medicine and anatomy: amongst others, 'Remarks on the Fever of 1793,' and 'Memoirs on the Ethmoid Bone,' and 'on

Digitized by Google

the Remains of an Animal belonging to the genus Bos.' In 1812 he published, in 2 vols. 8vo, 'A System of Anatomy,' a work embracing the subjects, anatomical and physiological, which constituted his course of lectures in the college. He was very successful as a teacher, and his lectures were always well attended. He died on the 22nd of January 1818, of a fever which he caught during his professional duties.

WITHER, or WYTHER (sometimes improperly WITHERS), GEORGE, was born June 11th, 1588, at Bentworth, near Alton in Hampshire, and was the only son of George Wither of Bentworth, who was himself the second son (the first by a second wife), of John Wither, Esq., of Manydowne, Salisbury-St. Lawrence, in that county. The name of Wither's mother was Anne Serle. After receiving the usual instruction at the grammar-school of Colemore, or Colemere, under its eminent master, John Greaves, he was sent about 1604 to Magdalen College, Oxford, where he had for his tutor Dr. John Warner, afterwards bishop of Rochester. After remaining however about three years, he was called home without having taken a degree, as he himself tells us (in his 'Abuses Stript and Whipt'), "to hold the plough." Anthony Wood says that "his geny being addicted to things more trivial" than the studies pursued at the university, he went to London and entered himself first at one of the Inns of Chancery, afterwards at Lincoln's Inn. "But," continues Wood, "still his geny hanging after things more smooth and delightful, he did at length make himself known to the world (after he had taken several rambles therein) by certain specimens of poetry; which being dispersed in several hands, [he] became shortly after a public author, and much admired by some in that age for his quick advancement in that faculty." Some pieces of less pretension had already made his name known in a limited circle, when in 1613 he published his volume of poetical satires on the passions of the time, entitled 'Abuses Stript and Whipt.' For some things in this production which gave offence to the government he was committed (it is not stated by what authority) to the Marshalsea prison, and lay there for several months. While in confinement he wrote and published his 'Satire to the King,' 1614, in which he complains bitterly of the injustice of his detention, and which is supposed to have procured his release. The spirit of his poetry and the usage he had met with now made him a great favourite with the puritanical party, by whom, Wood states, he was much "cried up for his profuse pouring forth of English rhyme." Afterwards, it is added, "the vulgar sort of people admired his poetry as having in it something prophetical. He denounced the abuses of the times too in various prose pamphlets as well as in his more frequent discharges of flowing verse. All this while he appears to have lived in easy circumstances on the hereditary property which he had inherited. But, as might have been expected in so hot and restless a spirit, Wither, as soon as the storm of the civil war began to blow, hastened to throw himself into the scene of commotion and excitement—at first, as it would appear, without much minding which side or what principles he fought for. He served as captain of horse, and quarter-master-general of his regiment, in the expedition which Charles I. led against the Scotch Covenanters in the spring of 1639 (also, it may be noted, the first campaign of the cavalier-poet Lovelace). Three years after, when the war began between the two English subjects, Wither "sold his estate and raised a troop of horse for the Parliament, in whose army he was speedily promoted to the rank of major. On his colours, we are told, he carried the motto, 'Pro Rege, Lege, Grege.' Being taken prisoner by the royalists, he is said to have been indebted for his life to a boon-mate of Sir John Denham—"Denham," says Wood, "some of whose estates at Egham in Surrey Wither had got into his clutches, desired his Majesty not to hang him, because, so long as Wither lived, he (Denham) would not be accounted the worst poet in England." He also probably soon recovered his liberty. Not long after this, Wood tells us, "he was obtruded by the Long Parliament a justice of peace in quorum for Hampshire, Surrey, and Essex, which office he kept six years, and afterwards was made by Cromwell major-general of all the horse and foot in the county of Surrey, in which employment he licked his fingers sufficiently, gaining thereby a great odium from the generous royalists." A manuscript note on a copy of one of his tracts in the British Museum, his 'Boni Ominis Votum,' printed in 1656, describes him as "lately made master of the statute office."

At the Restoration, Wither was not only forced to disgorge all this spoil, but was by a vote of the Convention Parliament sent to Newgate on the charge of being the author of a publication entitled 'Vox Vulgi,' which was regarded as a scandalous and seditious libel. There is extant a 12mo pamphlet which he published in 1661, entitled 'The Prisoner's Plea humbly offered in a Remonstrance, with a Petition annexed, to the Commons in parliament assembled, by G. Wyther, falsely charged to have composed a libel against the said Commons, and therefore now a prisoner in Newgate;' but Wood asserts that he afterwards confessed himself the author of the obnoxious publication, upon which he was committed a close prisoner to the Tower, with orders that he should be debarred the use of pen, ink, and paper, and at the same time an impeachment was ordered to be drawn up against him. The impeachment does not appear to have been proceeded with; and he even contrived, by the connivance of the keeper, to write and to send to the press from time to time sundry pieces both in verse and in prose. It is not known when he was released: Wood says that he lay in the Tower three years and more; Aubrey's account is, that his imprisonment lasted about three-quarters of a year; it is certain however that he had obtained his liberty some years before his death, which took place on the 2nd of May 1667. He was buried, says Aubrey, "within the east door of the Savoy Church, where he died." He had married, the same authority states, Elizabeth, eldest daughter of H. Emerson, of South Lambeth: "she was," Aubrey adds, "a great wit, and would write in verse too." It appears that a grandson of Wither's, Hunt Wither, of Finding, in the county of Southampton, designating himself colonel of foot in her majesty's service, and brigadier-general in the service of Charles III., of Spain, was alive in 1709. But his paternal estate of Bentworth had latterly come into the possession of an heir female, and was a few years ago held by Mr. Bigg Wither, who in consequence had taken the old family name. (See 'Memoir of Wither,' in 'British Bibliographer,' vol. i., pp. 1-18, published in 1810.) Anthony Wood characteristically rounds off his account of Wither with the critical remark that "the things that he hath written and published are very many, accounted by the generality of scholars as mere scribbles." The list of his works fills about 13 columns in Dr. Bliss's edition of the 'Fasti Oxonienses.' But the most detailed catalogue of them is that contributed to the 'British Bibliographer' by the late Mr. Thomas Park; it includes 112 articles (among which however are some not known to have been printed), and extends over vol. i., pp. 179-205, 305-332, 417-440, and vol. ii., pp. 17-32, 373-391. Various bibliographical notices relating to Wither are also to be found in the pages of the 'Restituta' and the 'Censura Literaria.'

Some of Wither's religious verses continued to be printed for some time after the commencement of the last century, but were in request no doubt chiefly for their devotional rather than their poetical qualities. The estimation in which he was then held as a poet may be gathered from the contemptuous mention of him by Pope in the 'Dunciad' (book i. 296; see also the note on v. 146)—

> "Safe, where no critics damn, no duns molest,
> Where wretched Withers, Ward, and Gildon rest."

Swift has also spoken of him in similar terms (in an unlucky passage however in which he couples him with Dryden). Even Bishop Percy, who published his 'Reliques' at this time, in publishing one of Wither's short pieces in the first (1765) edition of his 'Reliques,' vol. iii., p. 120, does not venture to prefix the author's name: "This beautiful old song," he merely says, "is given from a very ancient copy in the editor's folio MS." So also in the case of another fragment at p. 253. And even in the subsequent editions of the work his admiration of Wither is very cautiously expressed. In the fourth edition (1794), the last he superintended, he speaks of him as merely "not altogether devoid of genius" (vol. iii., p. 190). Long before this indeed, in the poem entitled 'Bibliotheca,' published in 1712, the author, supposed to be Dr. William King, had coupled him with the epithet of "melodious Wither;" and to some to intimate that he had still a sort of reputation among poetical antiquaries. One of the first persons who expressed a cordial appreciation of the merits of Wither's poetry was the late Mr. Octavius Gilchrist in the 18th volume of the 'Gentleman's Magazine,' published in 1797. Since then ample justice has been done to this long neglected writer by the late Mr. George Ellis, in the second edition of his 'Specimens of Early English Poetry' (1801); by Mr. Thomas Campbell, in his 'Specimens of the British Poets' (1819); by the late Mr. Hazlitt, in his 'Lectures on English Poetry' (1818); and especially by the late Sir Egerton Brydges, in the 'Restituta,' the 'Censura Literaria,' the British Bibliographer, and other publications; and there have been many reprints of his poetry or portions of it.

The merit of Wither's poetry is of very unequal excellence, and a good deal of it is worthless enough. His fatal facility, which grew upon him as he advanced in life, and soon debased his style from freedom to slovenliness, has left nearly everything he has done weak and unfinished in some part or other. But there was in him a true poetic genius, a quick and teeming invention, a universal sympathy, a fancy that could gild any subject, or "make a sunshine," like Spenser's Una, "in the shadiest place;" above all, a natural love of truth and simplicity, which, whatever else may be sometimes wanting, has put a life and enduring freshness into all that he has written. His earliest style is in his happiest; in that he seems to have sought by art and pains for the directness and transparency for which he afterwards trusted mostly to negligence or chance; latterly also he took, apparently from design, to a greater harshness both of phraseology and rhythm; but, both in his verse and in his prose, his English is rarely without the charm of great ease and clearness, as well as idiomatic vigour.

WITHERING, WILLIAM, was born in 1741, at Wellington in Shropshire, where his father was a surgeon-apothecary in considerable practice. He received his early education at a school in his native place, and commenced his medical education under his father's instruction. After spending the usual preliminary time with his father, he was sent to complete his medical education at Edinburgh, in the university of which place he took his degree of Doctor of Medicine in 1766. He commenced the practice of his profession at Stafford, where he married; but not succeeding, he removed to Bir-

Digitized by Google

mingham in 1774. Here he became the successor to Dr. Small, and quickly succeeded in obtaining a large and lucrative practice. His income is said to have been larger than any physician of his day out of London. In the midst however of his great professional avocations he found time to cultivate with great ardour the sciences connected with natural history. He was accordingly attached to botany, and having become acquainted with a large number of the plants growing in Great Britain, he was induced to publish, in 1776, a work on the plants of this island. It appeared first at Birmingham, in 2 vols. 8vo, and was entitled 'A Botanical Arrangement of all the Vegetables naturally growing in Great Britain.' As the work appeared at first it was little more than a translation of the descriptions of the British genera and species from the great work of Linnæus, with the addition of many of the habitats of the plants from Ray's works. The work however was wanted, and quickly found a sale. A second edition was published in 1793, and a third in 1796. In this edition the work was increased in size to four volumes, and a vast amount of original matter added, so as to give it quite a different character from the first edition. In this work he was much assisted by many of his botanical friends, and he has everywhere acknowledged how much he was indebted to Dr. Stokes and Messrs. Woodward, Valley, Stackhouse, and others. Since the death of Dr. Withering several editions of his 'Arrangement of British Plants' have been published. It is now however entirely superseded by the more valuable manuals of Smith, Hooker, Babington, &c. I had the merit of having the first work on British Flora arranged according to the Linnæan system; and the early editions may now be consulted with advantage on the properties and uses of the plants native to Great Britain, and the traditions about them.

Botany was not Withering's only scientific pursuit; he was fond of chemistry and mineralogy. He published in 1793 a translation of Bergmann's 'Scaographia Regni Mineralis,' with the title 'Outlines of Mineralogy.' He was a Fellow of the Royal Society, and published several papers on mineralogy and chemistry to the 'Philosophical Transactions,' of which the following are the titles:—In the volume for 1773, 'Experiments on different kinds of Marle found in Staffordshire;' in 1782, 'Analysis of the Tealstone of Derbyshire;' in 1784, 'Experiments on the Terra Ponderosa;' in 1796, 'An Analysis of a Hot Mineral-Spring in Portugal.' These papers display a very large knowledge of the chemistry of the time. But whilst pursuing science he did not neglect his profession, and he published several papers on medical topics. In 1778 he published 'An Account of Scarlet Fever and Sore Throat, especially as it appeared in Shropshire in the year 1778,' 8vo. He also published in 1785 'An Account of the Foxglove and some of its medical uses; with practical remarks on the Dropsy and other diseases.' Although he was not the first to recommend foxglove (*digitalis*) as a medicine, he must still be looked upon as the first physician who knew how to use it, and by his writings gave it the character as a powerful medicinal agent, which it has never since ceased to retain.

Dr. Withering was always the subject of a weak state of health, and was frequently attacked with inflammation of the lungs. This had so much weakened him in 1793 as to induce him to try a change of air for the benefit of his health, and he accordingly spent the winter of that year in Lisbon. At the latter end of the year 1794 he again went to Lisbon, and returned the following year. His health was somewhat re-established, and on returning to Birmingham again he changed his residence from Edgbaston Hall to a place called the Larches, previously the residence of Dr. Priestley. Here in retirement he spent the remainder of his days, and died October 6, 1799.

WITHERINGTON, WILLIAM FREDERICK, R.A., was born in London, in 1786. As a landscape painter Mr. Witherington has secured a very respectable position, and he has also painted many clever genre pictures and portraits. His landscapes are all thoroughly English in character,—Lane Scenes, Kentish Hop Gardens, Riverside Ferries, Water Mills, and the like,—and his knowledge of the human form has enabled him to diversify them with groups of figures—a little larger in size than are usually put in landscape foregrounds—engaged in some characteristic occupation, or indicating some rustic incident, from which his pictures generally derive their titles ('The Angler,' 'The Lucky Escape,' 'Making Hay,' 'The Robin,' 'The Hop Garland,' 'Passing the Lock,' 'A Lift on the Road,' 'Returning from the Village,' and so forth), and which have served to increase their popularity with the ordinary visitors to the exhibition-rooms and picture galleries. Mr. Witherington does not take rank with the highest class of English landscape-painters, but his genuine love of nature, and directness of purpose, and the homely unpretending range of his subjects, will always render his pictures favourites with the lovers of English rural scenery and country life. He was elected A.R.A. in 1830; and R.A. in 1840. In the Vernon Collection are the two pictures by him—'The Stepping Stones,' and 'The Hop Garland' and in the Sheepshanks' Collection one—'The Hop Garden.' [SUPP.]

WITHOF, JOHANN PHILIPP LORENZ, a German physician who distinguished himself as a writer of didactic poetry, was the son of Johann Hildebrand Withof, professor of history, eloquence, and Greek literature, and was born at Dnisburg on the Rhine, June 1st, 1725. In 1740 he entered the university of his native place, where for the first three years, he applied himself to classical literature, history, and antiquities, and afterwards entirely to medicine. His father then sent him to Utrecht and Leyden, on returning from which seats of study he obtained his medical diploma at Duisburg, in 1747, and began to practise at Lingen, but did not remain there above three years. After an interim of about two years more, at Duisburg again, during which he lectured on anatomy and physiology, he accepted, in 1753, an appointment in the gymnasium at Hamm, as professor of history and philosophy. About the same time he was made corresponding member of the Göttingen Scientific Society, and also of the Royal Society, London. He continued at Hamm until he received an offer from the university of his native place, in 1770, inviting him to accept the professorship of eloquence and Greek literature, which he held at the time of his death, July 3, 1789.

Though most of his poems had been composed very long before, being in fact the productions of his youth, only some few of them had actually appeared in print, it was not till 1782 that he gave them to the public, in two volumes, under the title of 'Academische Gedichte,' one, as Eschenburg observes, not particularly well chosen, since it does not convey any idea of their subjects, but would rather imply their being only occasional pieces, or else written for academical purposes. 'Philosophical' would have been a far more appropriate general epithet for them than 'Academical,' since it is the philosophical spirit, the depth of thought, and extensive learning they display, which have established for them the high though limited reputation they enjoy. Withof is a writer for thinkers, and made for mere readers of poetry; since, instead of alluring the latter to his didactic strains by the graces of language and felicity of expression, he is generally negligent even to harshness in his versification, and at times very obscure as to meaning, faults which he appears in some degree to have affected rather than to have endeavoured to shun. Still those who can overlook imperfections of that kind, and who attach more importance to the value of the matter than to any charm of manner, will be repaid by his 'Die Moralischen Kaiser,' and 'Sinnliche Erquickungen,' for the studious perusal which they require.

WITIKIND, WITTEKING, or WITTICHIND, was the principal duke or commander-in-chief of the Saxons in their wars with Charlemagne. He is also called king (Rex Saxonum et Alborum), but incorrectly, because the Saxons have never had kings: the government was in the hands of an assembly which met annually at Marklo, on the Weser, and to which each 'gau,' or county, sent twelve edelings or nobles, twelve freemen being freeholders, and twelve freemen having lands in lease. The Saxons inhabited the extensive tract between Schleswig, on the Northern Sea, and the Elder, in the north; the Baltic, the Trave and the Middle Elbe, in the east; the Saale, Thuringia, and Hesse, in the south; and a line in the west which corresponded probably to the present limits of the Prussian province of Westphalia. The western limits however were never well fixed. The Saxons were divided into the Westphalians west of the Weser; Engerns, who lived likewise west of the Weser, in the mountainous provinces of Sauerland; Eastphalians, between the Weser and Elbe; and Albi, or North Albingians, in the present duchy of Holstein. They were a fierce and warlike nation, and made continual incursions into the Frankish empire by land and by sea. Faithful to the worship of Woden and other gods of their forefathers, they made a strong opposition to the progress of Christianity, which was in their opinion only a disguised form of slavery. When Lebuin, the Anglo-Saxon, appeared among them for the purpose of preaching the Gospel, they not only refused to listen to him, but threatened his life; and he only escaped death by the mediation of his friend Buto, a Saxon noble.

By choosing Aschen (Aix-la-Chapelle) for his residence, Charlemagne clearly indicated that, being sure of the obedience of the west, he intended to extend his empire towards the east. He declared his intention to subdue the Saxons, and to force them to adopt the Christian religion, in the diet at Worms in the first year of his reign, 772. His first campaign was successful. He penetrated into the country of the Engerns, took their fortress of Ersburg (now Stadberg, on the Diemel) by surprise, and destroyed the 'Irmensaul,' a national monument. Great wealth was found there by the Franks. In the neighbourhood of this monument Charlemagne made a truce with the Saxons, and returned to his dominions in order to prepare his expedition against Desiderius, king of the Lombards. During the absence of Charlemagne in Italy the Saxons prepared for a fresh war, and chose two commanders-in-chief, Witikind and Ablion. Witikind had extensive estates in Engern and Westphalia, and it appears that he was duke of the warriors of these two countries; while Ablion commanded the Eastphalians and North Albingians. Witikind immediately invaded the Frankish territory; but in 775 Charles approached with a mighty host, and penetrated as far as the Oeker, in the present duchy of Brunswick. After several defeats the Eastphalians, whose duke Hessi, or Hessio, and the Engerns, whose duke was then Bruno, made peace and gave hostages to Charles. Bruno and Hessi were probably subordinate dukes. The Westphalians followed their example, but it does not appear that Witikind submitted. The truce was of short duration; but Charles made new progress, and built fortresses, in which he placed strong garrisons. In 777 he held a meeting at Paderborn, which was attended by a great number of Saxon nobles and commoners, part of whom were baptised and submitted to the Franks.

Digitized by Google

Witikind however did not appear, but fled to Siegfried, king of Denmark, whose sister Gera he had married. Charles, believing that Saxony would keep quiet, turned his arms towards the Arabs in Spain; but no sooner was he gone than Witikind, supported by a body of Danish horsemen, renewed the war; and when the Saxons heard that a Frankish army had been destroyed by the Basques in the valley of Roncesvalles, the whole country took up arms, and Witikind ravaged the Frankish territory as far as Cologne and Coblenz. Charles returned from Spain in 779, invaded Saxony, defeated his enemy at Bocholt (not far from Wesel), and in 780 encamped near the junction of the Ohre with the Elbe, where he once more received the homage of many chiefs, but not of Witikind, who remained in Northern Saxony and quietly waited for the absence of Charles, against whom he secretly excited the Sorbi, a Slavonian nation on the right bank of the Elbe. Suddenly he crossed the Elbe and destroyed a Frankish army at Mount Süntelberg, near Minden. Charles, infuriated, appeared with fresh troops, and having compelled a portion of the Saxons to give up their principal leaders with their adherents, he ordered them all to be beheaded near Verden, on the Aller, 4500 in number (783). This cruelty produced a terrible outbreak among the Saxons. A bloody but indecisive battle was fought near the place where Varus perished with three Roman legions, in the Teutoburger Wald; nor could Charles boast of having defeated his enemy in a second engagement which was fought near the sources of the Hase, north of Osnabrück. The places where Charles and Witikind had ranged their armies, two sand-plains, at a short distance from each other, near Verden, in a barren desolate country, are called to the present day, the one the 'Kerisfeld,' the other the 'Wittefeld.' During the two following years Charles continued an obstinate struggle with the Saxons; and seeing the impossibility of subduing them unless he gained their chiefs, he sent messengers to Witikind and Abbion, who were then in Holstein, and promised them the free enjoyment of all their estates if they would adopt the Christian religion and recognise Charles as their master. Upon this proposition they both submitted. They went to Attiniacum, now Attigny, near Rheims in Champagne, were Christian instruction was given to the Frankish king, and were baptised; whereupon they returned to their dominions (A.D. 785). The final subjugation of the Saxons was not however completely effected till the year 803.

A proof of Witikind's attachment to the Christian religion is his foundation of the convent, afterwards chapter of St. Alexander, at Wildeshausen, in the grand-duchy of Oldenburg, where the respective documents (though not signed by Witikind) may still be seen. At Wildeshausen there are some ruins, situated on a hillock surrounded by the Hunte, which are said to be the remains of the chief residence of Witikind; and in the mountains near Dissen, east of Osnabrück, there is a ruined stronghold called Witikinds-Burg. It is said, but it cannot be proved, that Witikind lost his life in 807, in a battle with Gerould, duke of Suabia. His body was interred at Paderborn, whence it was carried to Engern, and subsequently to Herford, near Minden. In 1377 the emperor Charles IV. ordered a monument to be erected to his memory in the parochial church at Engern, and in 1822 his remains were carried from Herford to Engern, and deposited under that monument.

(Eginhartus, *Vita Caroli Magni*, ed. Schminck, with the notes of Besold, Bolland, and Goldast; Poeta Saxo (Anonymous) in Leibnitz, *Scriptores Rer. Brunsvic.*; Möser, *Osnabrückische Geschichte*, vol. i., the best work on the subject.)

WITT, DE, JOHN and CORNELIUS, two of the ablest and most honourable of Dutch statesmen, were so inseparable in their career that the history of their lives must also be one. John, though the younger by two years, played, in consequence of his genial, versatile, and aspiring character, the more prominent part; but it is doubtful whether he could so long have sustained himself without the aid of his brother's solid though less showy parts. Corneliue was one of those rare and invaluable natures who intuitively feel themselves born to perform a secondary part, and are probably, in the persevering unostentatious discharge of their duties more useful as they are more difficult to find than even leaders of commanding talent. There is something extremely beautiful in the uninterrupted cooperation of two men like Cornelius and John de Witt, each among the very finest specimens of his own class of characters, when the tie of brotherhood strengthens the bands of friendship.

The father of John and Cornelius was a leader in the party opposed to the assumptions of the house of Orange, and a member of the States General of Holland and West Friesland. He was considered by advisers of the Stadtholder of unlimited consequence to be included among the eight citizens imprisoned in the castle of Löwenstein, in 1650. The young De Witts therefore were early imbued with hostility to the pretensions of the family of Orange, and devoted to the Republican and Arminian party; and at the same time encouraged by the position of their father to look forward to public employment.

JOHN DE WITT was born at Dordrecht in 1625, and educated at Leyden, where, in addition to the studies necessary for one who aspired to rise in the state, he is understood to have cultivated the mathematical sciences with success. A treatise published at Leyden, in 1650, under the title 'Elementa Linearum Curvarum,' is attributed to him.

The death of William II., prince of Orange, on the 2nd of October 1650, threw the management of affairs into the hands of the party to which De Witt's father belonged. Cornelius, his eldest son, having been, as will appear in the more particular notice of his career in the sequel of this article, appointed burgomaster of Dordrecht, the family influence obtained for John the office of pensionary of that city. The ability which he displayed in that charge procured for him, two years later (in 1652), when only in his 27th year, the more important appointment of grand pensionery of Holland, which he retained till 1672. During the intervening twenty years, he was, under the modest title of grand pensionery, virtual chief-magistrate of this province. The period was a critical one for Holland—during the earlier part of it De Witt was called upon to make head against Cromwell, and during the latter against Louis XIV., and he struggled at the same time against the invetercy of domestic faction.

De Witt on assuming the reins of government found the republic engaged in a war with England. A series of sea-engagements in which, although great skill and bravery were displayed by the Dutch and English commanders, and many lives were lost, victory inclined alternately to each side without declaring very decidedly for either, paved the way for a peace which was negociated by De Witt, and signed at Westminster on the 15th of April 1654. On the part of the Dutch the honours claimed by the English for their flag in the Channel were conceded. A secret article was appended to the treaty, in which it was stipulated that the Stuart family should receive no support from the United States, and that no prince of the house of Orange, so nearly allied to the Stuarts, should be elected stadtholder, or grand-admiral. This article was first signed by the representative of Holland alone: the other provinces were as jealous of the ascendancy of Holland as the republican party of the ambition of the house of Orange. This treaty also embraced the great outlines of the policy by which De Witt preserved during the whole of his future administration:—Avoiding giving umbrage to the States of Europe by stickling on points of empty etiquette; aiming to preserve peace and the security of its European possessions for Holland; balancing the rival European powers against each other; and guarding against the establishment of hereditary power in the house of Orange.

Towards the attainment of the last-mentioned object De Witt laboured indefatigably. The republican party preponderated in Holland, but the Orangists were known to Zealand. The other states hesitated between their fears of being domineered over by Holland or by the Prince of Orange. It was not till the year 1667 that De Witt obtained the assent of the States General to the 'perpetual edict,' by which the office of stadtholder was declared to be for ever abolished. There was however no admission of personal hostility to the Prince of Orange in this persevering zeal for the destruction of his house's power. William, prince of Orange, (afterwards William III. of England) was a posthumous child, and the care of his education devolving on the States, had been left entirely in De Witt. He discharged this duty conscientiously and sagaciously; and William, notwithstanding the hatred against De Witt which his mother endeavoured to instil into him, and notwithstanding his own ambition, which rendered him ready enough to take advantage of the grand pensionary's unpopularity, always retained and expressed, in his private letters, a grateful and respectful sense of the manner in which De Witt behaved towards him during his minority.

The next care of De Witt was to introduce order into the finances of the republic. In this he succeeded so well that the States of Holland presented a formal request to him that he would develop his financial system in writing.

Mutual respect had established a friendship that might almost be termed confidential between Viscount Turenne and De Witt. Turenne, in 1660, had endeavoured to persuade the French government to conclude treaties with Portugal and the United Provinces, as a check upon the ambition of Spain, but had been thwarted by Mazarin. On the death of that minister the vi-count renewed his representations to Louis XIV., who left the affair entirely in his hands. The price at which Turenne obtained the acquiescence of the grand pensionary in his scheme was a treaty of commerce between France and the United Provinces, concluded in 1661, by which each state conceded to the other entire freedom of commerce in their respective ports; the States General guaranteed the possession of Dunkerque to France; and the king of France guaranteed to the Dutch the right which they claimed of fishing off the coast of Great Britain and Ireland. The cabinet of Charles II. made a feeble remonstrance against this last article, but Louis contrived to appease them for the time.

But this effort rankled in the public mind of England; and the commercial rivalry between that nation and Holland soon accumulated other grounds of complaint. The mariners and traders of the two countries had frequent quarrels on the coast of Africa and in the Indies, and each persisted in representing the other as the aggressor. War was declared between Holland and England in 1665. De Witt invoked the aid of France, but in vain: Louis XIV. only offered his mediation. Admiral Opdam was defeated by the Duke of York and Prince Rupert off Harwich, and forced to seek shelter with the remainder of his fleet in the Texel. On this occasion De Witt gave a striking instance of the daring self-confidence which a great emergency could awaken in him. Antwerp was the only port in the possession

Digitized by Google

of the republic where the fleet could be refitted. The pilots refused to take upon them the responsibility of navigating the ships from the Texel to Antwerp, by a course which would secure them from the attacks of the English, and yet be free from the danger of stranding on the shallows. De Witt repaired on board the fleet; undertook the responsibility from which skilled professional men shrunk; conveyed the fleet in safety to Antwerp; and there, under his energetic superintendence, it again took the sea in fighting trim in an incredibly short space of time. Louis now declared in favour of Holland, and ostensibly issued orders to his fleet to join that of the United Provinces. No junction however took place, and after two more well contested battles between the naval forces of Holland and England, a peace was concluded at Breda, by a treaty, to which Denmark and France became parties, between the belligerents, on the 30th of July 1667.

De Witt endeavoured after the peace to concentrate his attention upon the internal organisation of the republic. The perpetual edict and the financial resolutions above alluded to were the first fruits of this determination. But the conduct of the French king soon interrupted these labours by drawing his attention to foreign affairs. Louis invaded the Spanish Netherlands in 1667, under the pretext that they fell by right to his queen on the death of her father the king of Spain. Turenne took one fortification after another with his usual rapidity, and was advancing towards Brussels, when the Marquis de Castel-Rodrigo represented to the states-general, that if France were allowed to conquer the Netherlands there would remain no barrier between it and the United Provinces. These representations were backed by those of Temple, sent by the English ministry to propose an alliance between Holland, England, and Sweden, with a view to oblige France and Spain to conclude a peace. His measure coincided with the policy of De Witt, who felt the danger of allowing France either the equal danger of remaining a passive witness of its aggressions. The triple alliance was resolved upon on the 23rd of January, 1668; signed on the 7th of February, and ratified on the 25th of April. At the same time the forces of the republic were secretly augmented by De Witt: 25,000 infantry were raised, and quartered in the frontier garrisons, and a fleet of forty vessels put in commission. These negociations were accelerated by the progress of the French arms in Franche Comté. The treaty disposed France to listen to overtures of peace, as the invasion of Franche Comté dispersed the court of Spain; and under the direction of De Witt and Temple the peace of Aix-la-Chapelle was signed on the 2nd of May. Louis dissembled his anger at the part taken by the United Provinces in these negociations till an opportunity of avenging himself should offer.

In 1670 Charles II. was persuaded by the intrigues of the French court to promise that England would withdraw from the triple alliance. In 1671 the bishop of Münster and several Roman Catholic princes of the Empire entered into a league with France for the purpose of reconquering some frontier towns which they alleged had been unjustly and forcibly torn from the Empire by Holland. In Sweden the council of regency appointed to conduct the affairs of state during the minority of Charles XI. was also detached from the interests of Holland. The inaction of De Witt while these intrigues were carrying on all around him would appear unaccountable for two reasons, circumstances which contributed to paralyse him. The first was the anarchical constitution of the republic, in which there was no central authority, every province and almost every town retaining its sovereignty. To raise money or levy the consent of an immense number of petty councils was necessary, composed of men whom immediate and visible danger alone could convince of the necessity of making the slightest sacrifices. The other circumstance was the growing strength of the Orange party, to which various causes contributed: popular fickleness, tired of an administration of twenty years' standing; the number of disappointed candidates for office which had accumulated in the course of twenty years; the inveterate malevolence of the Calvinistic clergy against the party of which De Witt was the chief; and the natural tendency of men to favour the pretensions of a house of real historical greatness. To this combination of adverse influences must the fact be in a great measure attributed, and when the frontiers of Holland were simultaneously assailed by the forces of Louis XIV. and the German princes, in the spring of 1672, the forts were held by garrisons weak alike in numbers and in the inexperience and want of discipline of the raw levies which composed them.

The partisans of the House of Orange seized the opportunity of national alarm and confusion to clamour for the repeal of the perpetual edict. De Witt and his friends were still strong enough to refuse this demand, but not to prevent the Prince of Orange from being nominated captain and admiral-general on the 25th of February 1672. A precaution taken to guard against any advantage William might be inclined to take of his military power rather precipitated than delayed the downfall of De Witt. Eight deputies were selected from among the members of the states-general to act as council to the military and naval commanders: Cornelius de Witt, who was one of them, was sent on board the fleet of De Ruyter; the other seven were ordered to accompany Prince William. As usual, a multiplicity of councils only embarrassed the commander-in-chief, and added to the number of reverses which enabled De Witt's enemies to raise a storm of public indignation against him.

France and England declared war against Holland on the 7th of

April; the elector of Cologne and the bishop of Münster a month later. In the course of two months the French and German armies had occupied the provinces of Gueldre, Over-Yssel, and Utrecht, taken fifty cities, and made upwards of 24,000 prisoners. At sea the Dutch were less unfortunate, but the utmost efforts of De Ruyter and his brave companions in arms were unable to achieve more than a drawn battle in the encounter with the Duke of York off Solbay. The advance guard of the French army was within five leagues of Amsterdam. The cities of Holland and Brabant, to avoid surrendering, were obliged to break the dykes and inundate the surrounding country. The clamour for the rescinding of the perpetual edict was successfully renewed at this disastrous crisis. The revocation of the edict was signed by the magistrates of the principal towns of Holland and West Friesland.

In the beginning of July Louis returned to Paris; Turenne was obliged to draw towards the German frontier to meet succours for Holland which were advancing under the elector of Brandenburg; and the Duke of Luxembourg was left in the conquered provinces with a force no more than sufficient to hold the Prince of Orange in check. The temporary relief from all-engrossing fear thus afforded to the inhabitants of the unsubdued provinces was employed by the enemies of De Witt in stimulating the populace against him by all kinds of malevolent misrepresentations. His brother was arrested on a false accusation, brought to the Hague, and on the 24th of July tortured and sentenced to perpetual exile. He himself was attacked by assassins in the streets of the same city, and dangerously wounded. After the condemnation of Cornelius, John visited him in prison; a mob assembled, uttering violent threats against both brothers. Three companies of cavalry, under Count Tilly, in garrison at the Hague, put in motion by their officers to rescue the two Witts, were ordered to move in another direction by the States of Holland, under the pretext that a body of insurgent peasants were advancing against the town. The brothers thus left without protection were savagely murdered, and their bodies attached to a gibbet. After the mob had dispersed, the bodies were decently entombed by order of the states-general; a faint effort was made to preserve appearances by ordering inquiry to be made after the murderers; and medals were allowed to be struck in honour of the murdered.

De Witt combined an active enterprising disposition with solid judgment; he was a persuasive orator and a dexterous negociator. He was bold in the hour of danger and patient under protracted reverses. For the space of twenty years he frustrated the hostility of all the great surrounding monarchies against the small and ill-organised republic at the head of which he stood. The honour of first introducing regularity into its finances, and in great part the honour of checking the progress of Louis XIV. by the triple alliance and the peace of Aix-la-Chapelle, belongs to him. That he should have fallen under the tyrannical circumstances which attended the close of his career is but to be wondered at than that he should so long have kept head against the anarchy of the Seven United Provinces. The truest mirror of his character is to be found in his works—the 'Mémoires de Jean de Witt, Grand Pensionnaire d'Hollande,' published at the Hague in Dutch, in 1667; in French, in 1709; and the 'Lettres et Négociations entre Jean de Witt et les Plénipotentiaires des Provinces Unies aux Cours de France, &c. depuis l'an 1652 jusqu'à 1669,' Dutch at Amsterdam, in 1725; French, in 1728. A 'Life' of the brothers was published at Utrecht in 1709, by Madame Zoutelandt.

CORNELIUS DE WITT was born at Dordrecht on the 23rd of June 1623. He is said to have served several years in the fleet of the United Provinces in his early youth. His later career however was essentially that of a civilian. On the overthrow of the Orange party in 1650 he was appointed burgomaster of his native town and elected deputy to the States of Holland and West Friesland. Soon after he was chosen inspector of dykes in the district of Putten. Ostensibly he held no higher office during the greater part of his brother's administration; but the confidence which his firmness, probity, business talents, and sound sense acquired from all rendered him in reality the most efficient supporter of his brother's power. As has been mentioned in the preceding sketch, he held a political appointment on board the fleet of De Ruyter in 1672; and in 1667 he had filled a similar post. On both occasions he distinguished himself by his bravery in action. After the battle of Solbay he was obliged to leave the fleet by a violent malady, and retired to Dordrecht. Before his arrival the other magistrates had signed the revocation of the perpetual edict. A tumultuous crowd intruded itself into his sick room, demanding his signature to the document. With great difficulty his friends persuaded him to comply; but he added the initials V. C. (vi coactus) to his name; and refusing to erase them, the mob was only pacified by one of his attendants doing it unknown to him. He was soon after arrested on a false accusation of conspiring to poison the Prince of Orange, conveyed to the Hague, and put to the torture. While on the rack he is said to have repeated Horace's ode, which begins "Justum et tenacem propositi virum." On the 24th of July he was condemned to perpetual exile, and his subsequent fate has already been narrated. The brothers were murdered on August 20, 1672.

The authorities for the incidents of the life of Cornelius de Witt are the same mentioned above in the sketch of his brother's career. Some valuable materials are also to be found for the history of both

Digitized by Google

brothers in the works of Sir William Temple and Ramsay's 'Memoirs of Turenne.'

WITTE, PIETER DE, or PIETRO CANDIDO, as the Italians have translated his name, or he for them, was born at Bruges in 1548. He went early with his parents to Florence, and studied as an historical painter there, in fresco and in oil. He was probably the scholar of Vasari, for he assisted that painter in Florence, and in his works in the Vatican at Rome. He made for the Duke of Tuscany many cartoons to be worked in tapestry. He was afterwards invited while in Italy, by the Elector of Bavaria, to go to Munich and enter his service, which he did, and he remained there many years, until his death in 1628, and all works of art produced in his time were executed under his direction. He was also the founder of the long gallery of the Hof-garten at Munich, a series of frescoes, representing the deeds of Otto of Wittelsbach, and the departure of the Emperor Ludwig IV. for Rome in 1327. These paintings were whitewashed over; the designs however are preserved in the tapestries which were worked from them, and in the engravings which were made by Amling from the tapestries; the prints are marked with the name of Pietro Candido as the painter. Amling engraved thirteen plates from these tapestries, representing the histories of the Emperor Otho, Louis of Bavaria, and Otho of Wittelsbach, according to Huber.

WITTGENSTEIN is the name of a noble German family, which is probably descended from one of those Frankish nobles upon whom Charlemagne conferred extensive estates in Saxony. This family has assumed the name of Sayn-Wittgenstein, although it never possessed the county of Sayn. The former county of Wittgenstein was situated in the southern corner of Westphalia, about the sources of the Sieg and the Lahn, a mountainous tract renowned for its rich iron-mines, and which exports great quantities of scythes and sickles. The counts of Wittgenstein were sovereign members of the German empire. They were early divided into two branches, the elder of which was subdivided into two under-branches—the counts of Sayn-Wittgenstein-Berleburg and those of Sayn-Wittgen-tein of Hohenstein, both of which acquired the title of Prince. The younger of the two branches above mentioned was raised to the rank of princes in 1834, on account of the military reputation of one of its members, Louis Adolphus, and who was one of the chief commanders of the Russian army in the wars against Napoleon.

LOUIS ADOLPHUS, COUNT OF WITTGENSTEIN, born in 1769, entered the Prussian army, and made his first campaign against France in 1793. He afterwards entered the Russian service, and fought with great distinction against the French and the Turks. In the campaign of 1807, in Prussia and Poland, he commanded under Benningsen, the Russian field-marshal, and was highly distinguished by the Emperor Alexander. Napoleon having invaded Russia in 1812, Count Wittgenstein was intrusted with the command of the right wing of the Russian army, which was to cover St. Petersburg, and the head-quarters of which were at Riga. He defended his position successfully, during the whole war, against Macdonald, whom he could not derive any benefit from his victories. When Austria adhered to the coalition (August 1813), Prince Schwarzenberg was invested with the command in-chief of the united forces of the allies, and Wittgenstein was superseded in his command by Barclay de Tolly for the Russian forces, and by Blücher for the Prussian army. He nevertheless continued in command of a strong division of the Russian army, and in the battle of Leipzig (16th-18th October 1813) was at the head of 70,000 men, with whom he occupied the position round the villages of Mark-Kleeberg, Wachau, and Liebertwolkwitz. In the campaign of 1814, in France, Wittgenstein, in the beginning of February, had penetrated as far as the neighbourhood of Paris, but Napoleon defeated him in the battles of Mormant and Nangis. After the war with Napoleon was terminated by the two peaces of Paris, Alexander rewarded him with estates in Podolia, and allowed on the counts coat of arms the inscription "Meine ehre geb' ich Niemand" ("I give my honour to nobody"). The merchants of St. Petersburg presented him with the sum of 150,000 silver rubles (30,000*l.*). In 1826 Wittgenstein was created a field-marshal, and, in 1828, the Emperor Nicolas gave him the command-in-chief against the Turks. The first campaign resulted in the passage of the Pruth and the Danube, and the conquest of Braila, Isakcha, Varna, and other fortresses, which were taken by the Russians. These advantages however were balanced by some severe losses, and Wittgenstein was recalled on the 18th of February 1829; but the emperor did not dismiss him without giving him new proofs of his esteem. Wittgenstein retired to his estates in Podolia, where he died in the beginning of the summer of 1843. In 1834 the King of Prussia conferred upon him and his successors the title of prince.

WITZLEBEN, KARL AUGUST FRIEDRICH VON, better known as a writer by his literary pseudonym of Von Tromlitz, the name of his father's estate near Weimar, where he was born March 17, 1772. At the age of nine he was enrolled among the pages at the court of Weimar, and there had Musæus and Herder for his instructors. Having entered very early into the Prussian service he obtained advancement in it, and distinguished himself in the Rhine campaigns of 1792-95. It was about the same time that he made his first literary attempt, being engaged by a publisher to complete a work entitled 'Avanturen der Deutschen am Rhine,' the author of which lived only to finish the first volume; and he also wrote several political pamphlets, at that period, and his romance, 'Das Stille Thal.' In 1803 Schiller encouraged him to cultivate that literary talent, their production was his last, until about twenty years afterwards, when he again appeared as a writer.

During that interval he was constantly engaged in military service, of which he experienced a great deal in various campaigns;—was at the battle of Jena; was taken prisoner at Prenzlau; became a commander of infantry in the army of the grand-duke of Berg (Murat); had a regiment in the Peninsular war, in 1811, when he was posted near Burgos; afterwards entered the allied army against France; and in 1813 became a colonel in the Russian service. At the g-neral peace his military career terminated, and he retired to Beuchlitz near Halle, where he followed farming for about the next seven years, when he went to Berlin, and at the age of forty-nine made literature his sole occupation. He did not however remain at Berlin many years, but in 1826 removed to Dresden, in which city and its neighbourhood he continued to reside till his death, July 9, 1839.

That 'Tromlitz' was both a fertile writer and a favourite one with the public, is tolerably evident from three editions of his collected tales and novels—two in 36, and one in 27 volumes—having passed through the press between 1838 and 1840. He distinguished himself chiefly by his historical romances—a species of literature greatly in vogue, and in which he took Scott for his model, and with perhaps as much success as any other of his imitators. Interest of story, cleverness of invention, and an agreeable style of narrative, sufficiently recommended his productions of that class to readers in general, though it has been alleged that they show no very great knowledge of history or deep insight into human nature. Those of most note among them are:—'Die Pappenheimer,' 'Franz von Sickingen,' 'Mutius Sforza,' 'Das Leben des Markgrafen Albrecht von Brandenburg,' and 'Hans Carracca.' He also displayed some dramatic talent in his 'Douglas' (1826), but not with such success as to encourage him to pursue that career.

WODROW, ROBERT, an antiquary and ecclesiastical historian, second son of James Wodrow, professor of divinity in the University of Glasgow, was born in that city in 1679. He studied at his native university, which he entered in 1691. While studying theology under his father, he was appointed librarian of the college, an office very congenial to his studious pursuits. He was licensed as a preacher in March 1703, and in the summer of that year he was ordained minister of Eastwood in Renfrewshire, a parish situated between Glasgow and Paisley. His history from this period to his death is almost entirely that of his literary labours. He felt that the seclusive and light duties of a retired and small parish gave him the best chance of leisure for the accomplishment of his projected works, and though repeatedly invited to accept of more important ministerial charges, in Glasgow and in Stirling, he spent the remainder of his days at Eastwood. He was however an active church politician; he punctually attended the ecclesiastical courts, and had much influence on their deliberations. He was chosen one of a committee of Presbytery to act with the commission of the Assembly in Edinburgh for the protection of the Church of Scotland, on the occasion of the Union of 1707. He exerted himself in opposing the Act of 1712 for re-establishing patronage, the same which, after having been for 130 years a source of division in the Church of Scotland, caused the great secession of 1843. Wodrow was the most prominent member of a committee of five clergymen who, on the accession of George I., were deputed by the General Assembly to proceed to London, and urge the repeal of the obnoxious Patronage Act. Defeated in his object, he became conspicuous among his brethren in recommending submission to the law as it stood, and in giving a beneficial effect to its operations. Yielding however on this point, he was one of those clergy who steadily resisted the imposition of the oath of abjuration; a test which virtually fell from desuetude as those who refused to submit to it were at the same time among the best friends of the Hanover succession. Though he objected to the tendering of tests involving a principle of civil government, to churchmen, he was a zealous supporter of the principle of subscribing articles of faith—that is to say, the articles of faith of his own church; and he conducted a long and laborious written controversy on the subject with the supporters of the independent principle in England and Ireland.

He died on the 21st of March 1734. It remains to give a cursory notice of his literary labours. His 'History of the Sufferings of the Church of Scotland, from the Restoration to the Revolution,' was published in two volumes, folio, in 1721-22. A few years ago it was a scarce and high-priced book, and in 1829 it was republished in four volumes 8vo, with a memoir of the author, by the Rev. Robert Burns of Paisley, now of Toronto, in Canada. Wodrow contemplated a

Digitized by Google

complete History of the Church of Scotland, in a series of lives of individuals conspicuously connected with it. The manuscript of this large work, not finally corrected for press, is in the library of the University of Glasgow. A considerable number of the Lives have been printed by the Maitland Club, and a portion of the work in among the publications of the Wodrow Society.

Wodrow was a zealous and minute historian. In narrating the persecutions of the Presbyterian nonconformists during the reign of Charles II., he undertook a subject in relation to which the bitterest feelings of indignation were still alive in the circle of society to which he belonged. The book is written in a purely partisan spirit. It contains a good deal of gossiping scandal, pays little respect to the characters of individuals of the Episcopal party, and invariably adopts the very worst view of their motives. It is generally admitted however to be faithful as a narrative of public occurrences, and few strictly party narratives can be so safely relied upon as the 'history of the troubles.' But the author is wholly wanting in toleration. Presbyterianism he looked upon as the truth; oppressing it he considered equivalent to making war on the Deity, and the toleration of any other form of worship he viewed as something only a degree less wicked. "The king's softness," he says, speaking of James VI. of Scotland, "as to Papists, and his carelessness to execute the laws, not only against them, but against every branch of wickedness now abounding, brought him into great contempt, and every one did according to his own eyes, as if there had been no king or settled government." ('Life of Bruce,' p. 25.) In the Advocate's Library there are six closely written volumes called 'Wodrow's Analecta,' a diary and collection of anecdotes, commencing with the year 1701. It is partly written in a secret hand, which has not been deciphered. This curious work has been printed by the Maitland Club. It exhibits a mind deeply tinged with a sort of dubious superstition—many spectral and prophetic stories such as the following are given, not as events for which the narrator "pledges his belief," yet always as told him by some person worthy of credit:—"Mr. John Welsh was preaching in the conventicle, and ther was one cast a loafe at him when preaching. Mr. Welsh stopped, and told them he knew not the person that had done soe, but he was persuaded ther would be moe persons at that person's death then ther wer hearing him preach that day; and everybody knows what a confession there was by Philip Stanfield's meanes for murdering his father, and this Philip was the person that thus mocked Mr. Welsh in his youth." Of course all the miraculous interpositions and special providences act in favour of the narrator's own side in church politics. The 'Wodrow MSS.' in the Advocate's Library amount to several hundred volumes. They are the collections made by the historian for the prosecution of his intended works. Many of them are original state-papers and letters, English and Scottish, bound up in volumes, with contents in Wodrow's hand-writing. Others are copies taken by himself of documents of which the originals in many cases are not now to be found. This collection, with his printed works, and many hundreds of long letters on ecclesiastical matters, are a striking illustration of his zeal and untiring industry. In May 1841 the 'Wodrow Society,' already referred to, was instituted "for the publication of the works of the fathers and early writers of the Reformed Church of Scotland."

WOELFL, JOSEPH, a distinguished composer and a performer on the pianoforte, was born at Salsburg in 1772, where he received instructions from Leopold Mozart, father of the illustrious Wolfgang, and from Michael Haydn, brother of the no less illustrious father of modern symphony. After a short musical tour he reached Vienna in 1795, and there successfully produced his first opera. He then visited Dresden, Berlin, Hamburg, &c., and arrived in London in 1799, where he remained, composing and giving concerts, two years, then proceeded to Paris, and in all those cities excited great admiration by his powers of execution. He returned to England in a few months, and resided in its capital till his death, which took place in 1811.

As a pianist, Woelfl exhibited very extraordinary powers. His hands, which were of gigantic dimensions, enabled him to do, by means of their capacious grasp and strength, what none of his contemporaries could accomplish, thus making him, as it were, the precursor of the living Thalberg; and his profound knowledge of harmony qualified him to turn to the best advantage the prodigality of nature, if it may be so considered. His compositions are numerous, extending to nearly every branch of the art, and all prove him to have been a thorough-bred musician, though many were written principally with a view to sale, and several are too elaborate and too difficult to be popular. Nevertheless, had he not indulged to excess in that habit which in his day was so prevalent with his countrymen, and which brought his life to a close at the premature age of thirty-nine, he probably would have made a reputation little inferior to that of the great musical triumvirate of modern Germany.

WOHLGEMUTH, MICHAEL, a celebrated old German painter and engraver on copper and in wood, was born at Nürnberg in 1434. He was the first German artist who attained any degree of excellence in painting, and he has the additional honour of having been the master of Albert Dürer. Wohlgemuth's wood-cuts are the oldest prints of that class in Germany of which the artist is known, and they are extremely scarce. Wohlgemuth's paintings are likewise scarce; there are two in the Augustine church at Nürnberg, another in Our Lady's chapel, and a Last Judgment in the town-house of the same place; and one in the church of Schwebach for which he was paid, in 1507, 600 florins, for that period a very great sum: some years after this the celebrated Amberger charged the Emperor Charles V. for his portrait only 35 florins. There is also a valuable work by him in the Imperial Gallery of Vienna, painted in 1511; another in the Louvre at Paris; in the Pinakothek at Münich there are five pieces by Wohlgemuth; and the Liverpool Royal Institution possesses five pictures attributed to him. He died in 1519, aged eighty-five. The king of Bavaria possesses a portrait of Wohlgemuth, painted in 1516, in his eighty-second year, by his pupil Albert Dürer; this is inscribed upon the back of the picture.

Wohlgemuth's style has the defects of the works of art of his age, especially in design; his works however are finished with extreme minuteness and accuracy of details, exhibit much expression, and in the draperies are superior to the works of many of the eminent German painters who succeeded him.

Wohlgemuth and Pleydenwurff cut in wood the illustrations of a curious and celebrated old work in folio, known as the 'Nürnberg Chronicle' of Hartmann Schedel, a physician. It was published first in Latin, in 1493, eight years after the death of its author, and was translated into German in the following year. The cuts consist of views of towns and portraits of eminent men. The Latin edition is sometimes, by the title connexion—'Liber Chronicorum per viam Epitomatis et Breviarii compilatus,' &c.

There are several old prints and wood-cuts marked W., which have been attributed to Wohlgemuth, but from their inferiority it is very doubtful whether he was the author of them: two other old engravers, Wenceslaus and J. Walch, marked their prints with a W, but it is not known that Wohlgemuth ever did.

WOIDE, CHARLES GODFREY, was a native of Holland, or of Poland according to Lefebvre-Cauchy, in the 'Biographie Universelle,' who also says that he was born in 1725, and that he studied at Frankfort-on-the-Oder and at Leyden. In 1770 he came to England, being appointed preacher at the German Royal Chapel, St. James's, where he afterwards became reader also. In 1782 he was appointed assistant-librarian at the British Museum, in the department of natural history, and soon afterwards in the department of printed books. The University of Copenhagen conferred upon him the degree of D.D., and in 1786 the University of Oxford the degree of Doctor in Civil Law. In 1788 he was chosen a fellow of the Royal Society. On the 6th of May 1790, he was seized with an apoplectic fit, and died in the house of Mr. Planta the next day, the following day, in his apartments in the British Museum. Dr. Woide left two daughters by his wife, who died in 1782. His principal literary productions are:—1, 'Matthurin Veyssière la Croze, Lexicon, Ægyptiaco-Latinum ex veteribus illius Linguæ Monumentis, quod in Coptopolitana Bibliotheca adservatur redegit Christianus Scholtz; Notitia Ipsiusmet adjecit C. G. Woide,' a Typographia Clarendon. Oxford, 1775, 4to. This is a dictionary of the Coptic language, which was made at the beginning of the 18th century by the learned French refugee La Croze, who published his preface to it in 1772, in the 'Bremer Ephemeriden.' The work however remained in manuscript, which was revised, abridged in some places, and completed in others by Scholtz. The revised manuscript became the property of the library of Leyden, where it was examined by Woide, who conceived the idea of publishing it. It is said that there was then no printing office in this country provided with Coptic characters, and the University of Oxford liberally undertook to bear the expense. Part of the work was already printed, when Woide was requested to make some additions to it, which he could only do for the three last letters of the Coptic alphabet: he also added an appendix. 2, 'Christianus Scholtz Commentatio Ægyptiaca utriusque dialecti, edita à C. G. Woide,' Oxford, 1778, 4to. This was a manuscript of the learned Scholtz, who had revised the dictionary of La Croze: it was very voluminous, and Woide abridged it so as to come into one printed volume 4to. He also made additions, and that part of the grammar which relates to the Sahidic dialect of the Coptic language is entirely by Dr. Woide. 3, 'Novum Testamentum Græcum, à Codice MS. Alexandrino qui Londini in Bibliotheca Musei Britannici asservatur, descriptum à C. G. Woide,' &c., ex Prelo Joannis Nichols, Typis Jacksonianis, 1786, folio. The Alexandrine manuscript of the Bible in the British Museum (King's MS., 1, D. viii.) is of great value. As Woide required the collation of the Vatican and other manuscripts made for Dr. Bentley, he addressed himself to the doctor's son, the Rev. Dr. Richard Bentley, rector of Nailston near Ashby in Leicestershire, who was in possession of those collations, and who allowed Woide to collate them during a fortnight in the house of the Rev. J. C. Gallaway, the vicar of Hinckley. Dr. Woide transcribed the part of the Alexandrine manuscript which he intended to publish with his own hand, and he collated it twice with the original: Dr. John Batley, the bishop of Oxford, assisted him in the transcription, and Mr. Harper, of the British Museum, in the collating. Woide wrote a Latin preface to this work, in which he gives a critical investigation of the history and merits of the Alexandrine manuscript. (Nichols, *Literary Anecdotes of the Eighteenth Century*, vol. ix., p. 9-14.)

WOLCOTT, JOHN, better known by his assumed name of Peter Pindar, was born at Dodbrooke in Devonshire, about the beginning of

Digitized by Google

1738. His father, a substantial yeoman, died about the time his son attained his eleventh year. John received the rudiments of his education at the free-school of Kingsbridge, a neighbouring market-town; and was, after his father's death, placed under the Rev. Mr. Fisher, master of a grammar-school at Bodmin. He described himself, in after life, as having been a dull scholar, but as having showed even at that early age a turn for versifying.

On leaving school he was removed to Fowey in Cornwall, to the house of an uncle, who was a medical practitioner. This gentleman sent his nephew to reside for a year in Normandy, with a view to attain a command of the French language. On his return John Wolcott became his uncle's apprentice for seven years. The determination of his apprenticeship he completed his medical education by the usual attendance in a London hospital. He appears to have applied himself with sufficient diligence to obtain a knowledge of his future profession; but he annoyed his uncle and two aunts by cultivating his talents for versifying and painting.

In 1767 Sir William Trelawny was appointed governor of Jamaica, and Wolcott, who had some connection with the family, was invited to accompany him. Before leaving England, Wolcott procured the degree of M.D. from the University of Aberdeen. His hopes of obtaining a lucrative practice in Jamaica were soon dispelled. The white population was not numerous, and the coloured could not pay. The incumbent of a valuable living in the island being dangerously ill, the governor suggested to his young friend that he might obtain preferment in the church. He acted upon this hint, proceeded to England, and was ordained by the Bishop of London; but on his return the clergyman whom he was to succeed had recovered, and he was obliged to remain contented with the curacy of Vere. His clerical duties he is said to have utterly neglected: his real employment was officiating as master of ceremonies to the governor. After the death of Sir William Trelawney, in 1768, Wolcott accompanied his widow to England, and never returned to the West Indies.

The next twelve years of his life were spent in attempting to establish himself as a physician at Truro, Helstone, and other towns in Cornwall. In this he was uniformly unsuccessful. He had, indeed, an invincible propensity to live as a practical humorist and satirise his neighbours, but he probably had no great amount of knowledge or skill in his profession. During his residence at Truro, some songs of his composition were set to music by Mr. W. Jackson, of Exeter, and first introduced him to general notice. In 1778 he published his first composition in that peculiar style which not long after obtained for him such a high and continued popularity—"The Epistle to the Reviewers.' It was during Wolcott's residence at Truro too that he detected the talents of the self-taught artist Opie. With this protégé he, in 1780, transferred his residence to the metropolis. Wolcott's own account of this adventure is as follows:—"At length I proposed to him to go first to Exeter and afterwards to London, and having lost an income of 300l. or 400l. by the change of scene, entered into a written engagement, by which it was agreed we should share the profits of his and my equal divisions. We actually did so for a year; but at the end of that time my pupil told me I might return to the country, as he could now do for himself." That his pupil, as he terms him, should have done so scarcely to be wondered at; but it does not appear that Wolcott contented anything to the 'joint profits;' or that he really sustained any pecuniary loss by his change of residence.

No opening offering itself in the metropolis, either in physic or divinity, Wolcott was obliged to betake himself to his pen for support. His satirical and ardistical talents suggested the subject of his first publication:—"Lyric Odes to the Royal Academicians for 1782, by Peter Pindar, Esq., a distant relation of the Poet of Thebes, and Laureate to the Academy,' took the town by surprise. The justice of many of his remarks, the reckless daring of the personalities, the quaintness of the style, were something entirely new: that the work obtained immediate popularity. Encouraged by success the author returned to the attack in 1783, 1785, and 1786. But he soon discovered that, in order to keep alive the first impression, he must vary his themes; and that the more daring he was in the selection of his objects of attack, the more would his works be run after, and the less would he incur any real danger. The king, ministers, opposition leaders, and authors, were assailed in succession. The latest public gossip was sure to be versified by Peter Pindar, and to be sought after with avidity. Partly by real talent, but far more by the most licentious personality, his works, as they issued in succession from the press, continued to be run after for a period of nearly forty years. A collected edition of them was published in 1812, but it is defective, for they were so numerous that the author himself could not retain them all in his memory. An imperfect list of Dr. Wolcott's works printed at the end of his life in the 'Annual Biography' for 1819 enumerates no less than sixty-four.

There is a fashion in the burlesque poetry of every age that is palatable to the public of that age only. The subjects of Wolcott's verses were ephemeral: they are now forgotten except by the students of the memoirs, pamphlets, and forgotten literature of his time. These circumstances will prevent their continuing generally popular. But the few curious inquirers who have a taste for the obsolete will acknowledge that Wolcott's popularity, though mainly, was not entirely earned by his audacious personalities. His versification is nervous, though not varied in its modulation; his language is racy and idiomatic; his wit, though often forced, is even more often genuine; and through all his puns and quaintnesses there runs a vein of strong manly sense.

The personal character of Wolcott is very far from an amiable one. His attempt to support himself by the labours of Opie has already been noticed. After all his biting satires on George III. and Pitt, he accepted a pension from the administration of which, Pitt was the head—not to laud it (for praise was not in his nature) but to vituperate its opponents. He took orders and even officiated as a clergyman, though an avowed and profane unbeliever. He had a shrewd intelligence, some taste in the arts of design and music (a series of his landscapes was engraved by Aiken, and published in 1797 under the title of 'Picturesque Views;' and some of his tunes have attained a permanent popularity); and his literary compositions have the finish of an artist. But his utter selfishness and entire want of principle rendered these intellectual tastes scarcely more elevated in him than his sensual appetites, which were equally regulated by taste and judgment. He was the perfection of a self-indulgent voluptuary both in physical and intellectual respects.

Wolcott's constitution was probably naturally strong, for he attained to the advanced age of eighty-one. But for many years previous to his death he was the victim of asthma, very deaf, and almost entirely blind. His mind however retained its full powers. He lived only for himself; declined dinner invitations "to avoid the danger of loading his stomach with more than nature required;" lay in bed the greater part of his time, because "it would be folly to me to be groping around my drawing-room," and because "when up and in motion I am obliged to carry a load of eleven stone, while here I have only a few ounces of blankets to support;" and when out of bed he amused himself with his violin, or examining, as well as his sight permitted, his crayons and pictures. He showed no aversion to receive notoriety-hunters who came to see and hear 'Peter Pindar,' but evinced no desire for society. He left a considerable property to his relations. John Wolcott died on the 14th of January 1819, and was interred in the churchyard of St. Paul's, Covent Garden.

WOLF, FRIEDRICH AUGUST, the greatest of modern German scholars, was born on the 15th of February 1759, at Hainrode, a village in the county of Hohenstein, near Nordhausen, where his father was organist, and from whence he was afterwards removed to Nordhausen, and appointed teacher at one of the schools of that town. Up to the seventh year, when he entered the gymnasium of Nordhausen, Wolf's education was conducted with great care and strictness by his parents. Under the influence of Heke, the head of that institution, Wolf early conceived that love of antiquity which never forsook him, and the same teacher also implanted in his mind a habit which characterises his whole literary life, the habit of thinking and judging for himself without being swayed by any authority, and of pursuing only one thing at a time. By following this system, and making consecutive use of his time, Wolf, even before he went to the university, had read all the most important ancient, as well as German, French, English, Italian, and Spanish writers. His father's intention was to make him, as well as his brothers Georg Friedrich, a professional musician, but he died after he himself had given him all the theoretical and practical instruction he was capable of, he sent both sons to the learned organist Schröter, who also instructed them in mathematics, a science to which Friedrich August had an aversion throughout life. But old Wolf's plan was adopted only by Georg Friedrich; for although Friedrich August was fond of music, and played several instruments, yet he regarded the art only as an elegant amusement, and was resolved to follow the course of study which he had commenced at the gymnasium. In 1777 he accordingly went to the University of Göttingen to study philology exclusively. He always prized private study more than any other; and in consequence of this he was often irregular in his attendance in the lecture-rooms. Heyne observed this inclination in Wolf, and on one occasion when Heyne was going to lecture on Pindar, and Wolf wanted to enter his name as one of his hearers, Heyne refused to admit him. From this moment Wolf avoided Heyne, and did not even attempt to become a member of the philological seminary, though in a financial point of view it would have been a material assistance to him. But Wolf nevertheless lived happy and retired at Göttingen, and he made up the deficiencies in his finances by giving private lessons to other students in Greek and English; and it is a curious fact, that in order to have an English book which he might read with his pupils, he published, in 1778, an edition of Shakspere's 'Macbeth,' with explanatory notes. Heyne was at the time a man of paramount influence in all scholastic matters in Germany, and Wolf before leaving the university presented to him a dissertation on Homer, in which he explained some points on which he ventured to differ from Heyne; but Heyne peremptorily refused to read it.

In 1779 Wolf left Göttingen, and was immediately after appointed teacher in the paedagogium at Ilfeld. Here he made himself first known to scholars by his edition of Plato's 'Symposium' (8vo, Leipzig, 1782; a second edition appeared in 1828), with notes and a valuable introduction in German. The manner in which Wolf treated his author met with general approbation, and attracted the attention of the Prussian minister, Baron von Zedlitz. In consequence of this pub-

Digitized by Google

lication Wolf was appointed, in 1782, rector of the public school of Osterode, at the foot of the Harz mountains. In the year following he received two invitations, one to the office of rector of the gymnasium at Gera, and the other to that of ordinary professor of philosophy in the University of Halle, and rector of the paedagogical institute, which was then connected with the university. Although the post at Halle was less lucrative than that of Gera, Wolf preferred it, because it opened to him a wider and more satisfactory sphere of action. His mode of teaching at Halle was so different from that which had been customary, that in the first years he was little understood and appreciated by the students, and he assiduously discovered that his truest descend to the capacity and knowledge of his hearers. From the time he adopted this plan his lecture-room was always crowded, and the greatest zeal prevailed amoog the students. With the assistance of Baron von Zedlitz, Wolf succeeded in transforming the paedagogical institute of Halle into a philological seminary, similar to that which Heyne conducted at Göttingen. As an academical teacher Wolf followed his own way, and being thoroughly convinced that there is no fitter means of educating men for the higher purposes of life than the study of the ancient languages and antiquity generally, his great object was to train a number of able teachers, who were to diffuse round principles of education throughout Germany, and counteract the numerous empirical schemes which were then afloat. Wolf always regarded it as his peculiar vocation to work as a teacher; literary labours and reputation were matters of secondary importance with him. To give the reader some notion of his extraordinary activity as a teacher, we may mention the fact, that during the twenty-three years of his professorship at Halle he delivered upwards of fifty courses of lectures on different parts of antiquity, independent of that which he did in conducting the philological seminary. In order to supply a suitable text of Hesiod for the purpose of a course of lectures on mythology, he published, in 1784, an edition of Hesiod's 'Theogony,' with a preface and some notes.

About this time his attention was drawn to the Homeric poems by the request of a publisher to prepare an edition of them. Many years however passed away before this plan was realised. In 1789 he published his celebrated edition of Demosthenes' oration against Leptines, together with the declamation of Aelius Aristides on the same subject. The learning displayed in this work excelled every thing hitherto had; and the ingenious emendations of the text, established his reputation as a first-rate scholar and critic. In 1795 he at length published the results of his Homeric studies in the celebrated 'Prolegomena ad Homerum,' in which he developed his views on the original form of the 'Ilias' and 'Odyssey,' explained the history of these poems, and pointed out in what manner their original form might be restored. With extraordinary sagacity and learning he here endeavours to show that the 'Ilias' and the 'Odyssey' in their present form are not the work of Homer, but the work of several rhapsodists, which were subsequently put together and made up in the two epics bearing the name of Homer. This work created a great sensation all through Europe, and gave rise to numerous historical and antiquarian investigations. Several scholars, and among them Heyne, endeavoured to diminish Wolf's merits by asserting that they had entertained similar ideas respecting the Homeric poems; and Heyne went so far as to say that Wolf had done nothing but strung together the notions which he had gathered at Göttingen. This unfounded assertion provoked Wolf to publish a series of letters addressed to Heyne, 'Briefe an Heyne, eine Beilage au den neuesten Untersuchungen über Homer' (8vo, Berlin, 1797), the first three of which are models of a learned controversy and exquisite irony. Wolf's 'Prolegomena' have unquestionably had greater influence than any other learned production of modern times; and although the author left the subject unfinished and arrived are now almost universally regarded as untenable, or at least greatly modified, yet the work begot that spirit of critical investigation which has ever since characterised the best among the learned works of Germany. It was Wolf who gave this impulse.

In the years 1801 and 1802, in which his literary activity was greatest, he published—1, Five orations of Cicero ('Post reditum in senatu,' 'Ad Quirites post reditum,' 'Pro domo ad pontifices,' 'De Haruspicum responsis,' and 'Pro Marcello'), and he endeavoured to prove that these orations are spurious, that they are mere declamations of later rhetoricians, and altogether unworthy of Cicero; 2, His edition of Suetonius, in 4 vols. 8vo (Leipzig, 1802), with the notes of Ernesti, Isaac Casaubon, and some of his own. This edition contains also the fragments of Suetonius Assyrianus,' and of the 'Fasti Praenestini.' 3, A collection of his smaller essays and occasional orations delivered at Halle, 'Vermischte Schriften und Aufsätze in Lat. und Deutscher Sprache,' 8vo, Halle, 1802. During this period Wolf received several honourable invitations from other universities; in 1796 an invitation to Leipzig; in 1798 another as chief manager of all the learned schools in Denmark; and in 1805 a third invitation to Münich. But he declined all these flattering offers, and was rewarded for it by the Prussian government with a considerable increase of his salary and the title of privy councillor (Geheimer Rath). During the time from 1804 to 1807 he was engaged in the publication of his text of the Homeric poems (8vo, Leipzig, 4 vols). A second and still better edition is that of 1817, in 4 vols. 12mo. It was reprinted, with a preface by G. Hermann, in 2 vols. 8vo, Leipzig, 1825, and in 1828, in 4 vols. 12mo. Wolf had not finished his edition of Homer when, after the disasters of 1806, the University of Halle was closed. As Wolf had no property, he was for a time in considerable difficulties. In 1807 he went to Berlin, where he found an opportunity of devoting his energy to the Academy of Sciences of that capital, of which he was a member. Here he also took a most active part in the establishment of the University of Berlin. For himself he wished to have the general superintendence of all the schools at Berlin, and the management of a philological seminary which was to be connected with the new university and the gymnasia of Berlin, and for which he drew up an excellent plan. In the meantime he also obtained a high office in the ministry for public instruction; but as he could not realise his plans, and as the duties of his several offices engrossed a great deal of his time which he would have preferred to devote to teaching—his favourite occupation—he withdrew from public service, but being a member of the Berlin academy, he reserved to himself the right of lecturing in the university on such subjects as might be most agreeable to him. During the period of leisure which now followed, he devoted nearly all his time to literary labours. From 1807 to 1810 he edited, together with Buttmann, the 'Museum der Alterthumswissenschaft' (Berlin, 2 vols. 8vo); the first volume contains Wolf's celebrated treatise 'Darstellung der Alterthumswissenschaft nach Begriff, Umfang, Zweck und Werth,' which was reprinted at Leipzig, 8vo, 1833, together with a select number of his smaller essays, by F. W. Hoffmann. In this treatise is the first in which Philology, or the Alterthumswissenschaft (a word for which an equivalent is much wanted in English), was treated as and raised to the rank of a science. In 1812 he edited three dialogues of Lucian ('Eunuchus,' 'Apologia Socratis,' and 'Crito'), Berlin, 1 vol. 4to, with an elegant Latin translation. From 1817 to 1820 he edited a periodical, 'Literarische Analekten' (Berlin, 4 vols. 8vo), perhaps the best philological journal that has ever been published. He gave it up suddenly in 1820, on account of the restrictions imposed upon the press by the government, to which he was unwilling to submit. Some years after this he began to suffer from ill health. In April 1824, he travelled to the south of France for the purpose of restoring his health, but he never returned to his country: he died at Marseille, on the 8th of August 1824.

An interesting volume compiled from the papers which Wolf had left on matters of education, was edited by W. Körte, Wolf's son-in-law, under the title 'Ueber Erziehung Schule, Universität (Consilia Scholastica),' Quedlinburg und Leipzig, 8vo, 1835. After the death of Wolf several of his former pupils edited, after notes of his most important courses of lectures, but the haste and carelessness with which the task was undertaken left much to be desired. These lectures are—1, 'Encyclopaedie der Philologie,' edited by Stockmann, 1 vol. 8vo, Leipzig, 1830; 2, 'Vorlesungen über die Alterthumswissenschaft,' edited by Gurlitt, 4 vol. 8vo, Leipzig, 1831-35; 3, 'Vorlesungen über die vier ersten Gesänge von Homer's Ilias,' edited by Usteri, 3 vols. 8vo, Bern, 1831.

(Hanhart, *Erinnerungen an Fr. A. Wolf*, 8vo, Basel, 1825; W. Körte, *Leben und Studien Fr. A. Wolf's*, 2 vols. 8vo, Essen, 1833; S. F. W. Hoffmann's *Preface to* Fr. A. Wolf's *Darstellung der Alterthumswissenschaft.*)

WOLF, HIERONYMUS, a German scholar of the 16th century, was born on the 13th of August 1516, at Dettingen, and belonged to a noble but reduced family. From his early youth he showed a great inclination to study, but his father, whose means were very limited, and who also thought the delicate constitution of his son unsuited for a studious life, tried to dissuade him from it. His son at last gave way, and resolved to become a soldier; but some books which chance threw in his way again changed his determination, and he went to the University of Tübingen, where he became a pupil of Camerarius and J. Schegk. As his father could not supply him with money, he was obliged to become a sort of literary servant (famulus) to one of the professors. He was however soon tired of this situation, and went to Würzburg, where he got a place as clerk in the bishop's office. Here too he did not remain long. He resigned his post and went to Wittenberg, where he attended the lectures of Melanchthon and others, and also began to translate some Greek authors into Latin, which was his favourite occupation. In 1539 he went from Wittenberg to Ehrenberg, where he acted for a time as assistant-master in a public school, until, in 1543, he was appointed rector of the gymnasium at Muhlhausen, on the recommendation of Melanchthon: but his restless disposition did not allow him to remain there more than two years; he resigned his office and returned to Nürnberg. Having stayed there for some time, during which he maintained himself by giving private lessons, he went to Strassburg. The next few years he spent partly at Strassburg and partly at Basel, being all the while zealously engaged in preparing his editions of Isocrates, Demosthenes, and Aeschines. From Strassburg he accompanied some young men whom he instructed in Greek, to Paris, and after a short stay there he returned to Basel. He now took his degree of Master of Arts, and then went to Augsburg, where he at length found a resting-place. Anton Fugger received him into his house, made him his librarian, and employed him in carrying on his Latin correspondence. After having been in this situation for six years, from 1551 to 1557, he was appointed professor of Greek in the gymnasium of Augsburg. Soon after he was promoted to the

Digitized by Google

rectorship of the same institution, and obtained in addition to it the office of librarian of the public library of the city of Augsburg. These offices he held until his death, on the 8th of October 1780.

Hieronymus Wolf was a man of very extensive learning, and particularly distinguished for his knowledge of Greek, which he is said to have written with greater facility than Latin. Some of his works have Greek prefaces, which show that he possessed a perfect knowledge of Greek. His Latin translations from the Greek are more faithful and correct than elegant. He was a man of a very discontented disposition, and was often in a state of melancholy. He had scarcely any friend, and was never married. He was fond of astrological speculations. Among his editions and translations of Greek writers the following deserve to be mentioned, and some of them are still of great value, as he made good use of manuscripts:—1, An edition of Nicephorus Gregoras, with a Latin translation and notes, folio, Basel. 1562; 2, An abridged edition of Suidas, with a Latin translation, folio, Basel, 1581; 3, An edition of Demosthenes and Aeschines, with a Latin translation, the commentary of Ulpian, Greek scolia, various readings and notes, folio, Basel, 1572; 4, A very good edition of all the works of Isocrates, with a Latin translation and notes, folio, Basel, 1570. The edition of these three Attic orators is the best among his editions of ancient authors; 5, An edition of Zonaras, with a Latin translation, for which he collated five manuscripts, folio, Basel, 1557; 6, The first edition of Nicetas Acominatus, with a Latin translation, folio, Basel, 1557. He also wrote notes on several works of Cicero, which however are not of much value, and some original treatises, such as 'Dialogus de Ueu Aetrologiae,' and several others.

WOLF, JOHANN CHRISTOPH, a learned Lutheran divine, was born on the 21st of February 1683, at Wernigerode, where his father was ecclesiastical superintendent. In 1695 the family removed to Hamburg, where the father died three months after his arrival; but young Wolf found a friend in Johann Albert Fabricius, who received him into his house, allowed him the use of his extensive library, and also gave him great assistance in his studies. The young man availed himself of these opportunities, and before he had attained his twentieth year, and before he went to the university, he had not only read the most important among the ancient writers, but also the whole Commentary of Eustathius upon Homer, and conjointly with Peter Zorn he drew up a list of the authors mentioned in that commentary. This list is printed, with a few improvements, in Fabricius's 'Bibliotheca Graeca' (vol. i. p. 457-501). Schwarz had made a similar list of authors referred to in the Scholia on Apollonius Rhodius, which is likewise printed in Fabricius (vol. iv., p. 279-286). Having obtained a scholarship, which enabled him to continue his studies, he went in 1703 to the University of Wittenberg.

He took his degree of M.A. the year after, and in 1706 he began lecturing at Wittenberg on philosophical subjects, but as the disturbances then caused by the Swedes in northern Germany drew away many of the students, Wolf left Wittenberg in 1707, and returned to Hamburg: in the same year he was appointed conrector of the gymnasium at Flensburg, but he employed the year 1708 in a journey through Holland and England, and spent the greater part of the time in examining the libraries of these countries, especially the Bodleian library. On his return he resigned his office at Flensburg, and after having visited Denmark in 1710, and the University of Copenhagen, he went to Wittenberg, where he again commenced the career of an academical teacher, as professor extraordinary in the philosophical faculty. His lectures were favourably received, but a few years after he accepted the office of the professorship of Oriental languages at the gymnasium of Hamburg, and being soon after promoted to the rectorship of the same institution, he also obtained with it the office of preacher in the cathedral. In 1716 he was appointed pastor in the church of St. Catherine, and he held this post until his death, on the 25th of July, 1739.

J. C. Wolf was never married: his unwearied studies and his love of books, which he seems to have imbibed from Fabricius, left no room for any other attachment. He had collected an immense number of Oriental and Rabbinical works, both printed and manuscript, and his library amounted to upwards of 25,000 volumes, which in his will he bequeathed to the city of Hamburg, where it still exists. Wolf did for Jewish and Rabbinical literature what Fabricius did for Greek and Roman literature, and his works on those subjects are still indispensable to those who study that branch of literature. His principal works in this department are—1, 'Bibliotheca Hebraica, sive notitia tum auctorum Hebraeorum cujuscunque aetatis, tum scriptorum, quae vel Hebraice primum exarata vel ab aliis conversa sunt,' Hamburg, 4 vols. 4to, 1715-33. A supplement to this important work was published by H. F. Köcher, under the title 'Nova Bibliotheca Hebraica,' Jena, 2 vols. 4to, 1783 and 1784. 2, 'Historia Lexicorum Hebraicorum,' Wittenberg, 8vo, 1705. Besides these he wrote several treatises on Hebrew, on the history of the Manichaeans, and on the use of the Rabbinical literature. He also translated Lardner's 'Credibility' into Latin. His merits as a classical scholar are not much inferior to his merits as a rabbinical scholar. The following list contains his most important works connected with classical literature, and his editions of ancient authors: 1, 'Dissertatio epistolica, qua Hieroclis in aures Pythagoras carmina commentarius nuper in Anglia editus (by Needham) partim illustratur et partim emendatur,' &c., Leipzig, 8vo, 1710; 2, 'Origenis Philosophumena,' Hamburg, 8vo, 1706: 3, 'Libanii Epistolae,' with notes and a Latin translation, Amsterdam, fol. 1738. This is still the best edition of the Letters of Libanius, and contains about one hundred letters which are not in any previous edition, and which Wolf had before edited separately. 4, 'Anecdota Graeca sacra et profana, ex codicibus manu exaratis nunc primum in lucem edita, versione Latina donata et notis illustrata,' Hamburg, 4 vols. 8vo, 1722 and 1723.

(Seelen, *Commentatio de Vita et Scriptis J. C. Wolfii*; Moller, *Cimbria Literata*; Götte, *Jetzt lebendes Gelehrtes Europa*, Braunschweig, 1735, &c.)

WOLFE, REV. CHARLES, was born at Dublin on the 14th of December, 1791, and was the youngest son of Theobald Wolfe, Esq. of Blackhall, in the county of Kildare (of the same family with General Wolfe). The death of his father while Charles was still a child occasioned the removal of the family to England. After being at several schools he was finally sent to Winchester college, where under Mr. Richards, sen., he distinguished himself by his rapid progress in classical knowledge and especially by the talent he showed for Greek and Latin versification. In 1809 he entered the university of Dublin, where at the usual period he obtained a scholarship, and became a very active college tutor. Most of his poems, his biographer tells us, were written within a very short period, during his abode in college. He took his degree of B.A. in 1814, and soon after commenced the task of reading for a fellowship; but although he is said to have evinced a decided genius for mathematics, his habits of study were always impulsive and desultory, and he soon flagged in this pursuit. A disappointment in love which he met with at last determined him, in 1817, to give it up altogether; the income of the scholarship would have enabled him to marry the lady to whom he was attached; "but, unhappily," says his biographer, "the statute which made celibacy incompatible with that honourable station had been lately revived." It is stated however that this circumstance had no influence in determining the choice of his profession; that the prevailing tendency of his mind had always been towards the ministry. Accordingly, he took holy orders in 1817, and immediately entered upon the duties of the curacy of Ballyclog in the county of Tyrone, from which however in the course of a few weeks he removed to the extensive parish of Donoughmore, where he officiated in the same capacity. Here Wolfe devoted himself with activity and zeal to his spiritual calling, and soon acquired the love and veneration of almost the whole of his parishioners of all denominations. But his exertions, and, still more perhaps than his attention to the welfare of others, his neglect of his own health and comfort, speedily began to wear him down; a constant tendency to consumption in his constitution, of which some symptoms had appeared while he was at college, was confirmed; a hurried journey which he made to Scotland in May 1821 (in the course of which he spoke at a public meeting held in Edinburgh to receive a deputation from the Irish Tract Society), brought his malady suddenly to a height, and forced immediately after his return to Ireland to leave his parish and place himself under medical treatment at Dublin. There for a short time he continued to preach occasionally with his usual energy; but he gradually got worse; as winter approached it was thought advisable that he should go to the south of France, but after being twice driven back to Holyhead he gave up the attempt, and fixed himself near Exster; on the return of summer he came back to Dublin; in August he made a voyage to Bordeaux; in November, as a last remaining hope, he removed to the shelter of the South of Devon; and there he expired on the morning of the 21st of February 1823, in the commencement of his thirty-second year.

His literary compositions were collected and published in 1825 by his friend the Rev. John A. Russell, M.A., archdeacon of Clogher, under the title of 'Remains of the late Rev. Charles Wolfe, A.B., Curate of Donoughmore, Diocese of Armagh.' From this small volume, which has been very popular, and passed through many editions, the above facts have been taken. An interesting sketch of Wolfe's history is also given in a 12mo volume entitled 'College Recollections,' published at London in the same year with Archdeacon Russell's work, but we believe some months before it. The 'Remains' (filling 368 pp.) consist principally of Fifteen Sermons, an appendix of miscellaneous thoughts and other fragments, and some juvenile poems, some letters, and other compositions inserted in the Memoir, which, including these, occupies nearly half the volume. Wolfe's literary reputation rests on his famous ode entitled 'The Burial of Sir John Moore,' which he composed in 1817, on reading Southey's prose narrative in the 'Edinburgh Annual Register,' and which first appeared soon after with his initials, though without his knowledge, in the 'Newry Telegraph,' from which it was immediately copied into the London papers, and from them into those of Dublin. The poem, which in the pathos of a noble simplicity has rarely been surpassed, drew much attention from the first; but its authorship remained unknown, except to a small circle of Wolfe's friends or associates, until the question came to be publicly discussed in consequence of a high encomium stated in Captain Medwin's 'Conversations of Byron' (published in 1824), to have been passed upon it by his lordship. The lines were attributed to various writers; and claimants to the honour of having produced them have started up from time to time; but none of these attempts to defraud the true author of his rights have

Digitized by Google

been persisted in; and any doubts which they may have raised were entirely dis-lpated by Archdeacon Russell's volume above referred to. A letter from Mr. Wolfe to a friend (Mr. J. Taylor) containing the ode is preserved in the Royal Irish Academy, and the history of it is given in the 'Proceedings of the Royal Irish Academy' for 1844. There are roune lines of Wolfe's written to the popular Irish air 'Gramachree,' which in their kind are little inferior in merit to those on the burial of Moore.

WOLFE, JAMES, was born at Westerham in Kent, on the 2nd of January 1726, the younger of two sons, the elder of whom died in his infancy. His father, Edward Wolfe, an officer in the British army, who had served with distinction under Marlborough, was made a major-general in 1745, and lieutenant-general in 1747; he died in 1759.

A commission was obtained for James at an early age. He was made a second lieutenant in the regiment of Marines, of which his father was colonel, in November 1741; ensign in Colonel Duroure's regiment in March 1742, and lieutenant and adjutant of the same regiment in July 1743; and captain in Barrell's regiment in June 1744. He was present at the battle of Dettingen in 1743, and of Fontenoy in 1745. He also appears to have served in the affair of Falkirk, Jan. 17, 1746, when the royal troops under Hawley were defeated by the Pretender's forces; and he served as Hawley's aide-de-camp in the battle of Culloden. He was also present at the battle of Laffeldt in 1747, where he had the good fortune to distinguish himself by his presence of mind at a critical juncture, and where he was wounded. The treaty of Aix-la-Chapelle restored peace to Europe in the course of the next year; but Wolfe (who was appointed major in Lord George Sackville's regiment in January 1749, lieutenant-colonel in the 4th in 1749-50, and colonel in October 1757, and transferred to the colonelcy of the 67th regiment in April 1758) had found means to keep alive the favourable impression he had made on the minds of his superior officers in action by the skill and attention which he evinced in the irksome routine duties of learning and preserving discipline. The precision with which the six British battalions of infantry performed their evolutions on the field of Minden (1759), and the firmness with which they kept their ground when exposed in consequence of Lord George Sackville's dilatoriness in bringing up the cavalry, were in a great measure attributed to the exertions of Wolfe during the peace.

Hostilities re commenced between France and Great Britain in 1755, and in 1757 Wolfe was appointed quarter-master-general to the forces, under Sir John Mordaunt, intended to attack Rochefort. While the military and naval commanders of that mismanaged armament were wasting time in idle controversy, Wolfe landed one night and advanced two miles into the country. His report of the absence of any obstacles to a descent, and his urgent recommendations that it should be made, as well as his offer to take the place himself if three ships and 500 men were placed at his disposal, were disregarded; but they became known to Pitt, and were the main reason of his afterwards selecting Wolfe to command in Canada.

In 1758 Wolfe was sent, with the rank of brigadier-general, on the expedition against Cape Breton, in which Boscawen commanded the sea and Amherst the land forces. The brunt of the hard fighting fell in landing before Louisbourg was borne by the left division under Wolfe; the attacks by the centre and right divisions being mere feints to distract the enemy. The after-operations of the siege were also in a great measure conducted by Wolfe; and it was an honourable trait in the character of Amherst that in his despatches he allowed his brigadier the full credit of his actions. The landing was effected on the 8th of June: Louisbourg surrendered on the 26th of July. Wolfe soon afterwards, by Pitt's desire, returned to England.

In 1759 an expedition was fitted out against Quebec by Pitt, who had resolved to deprive the French crown of its most important settlements in America. The command of the sea-forces was intrusted to Saunders; the command of the land forces (8000 men, including provincials) to Wolfe, who was created major-general. Wolfe was one of the youngest generals who had ever been appointed to so important a command. But Pitt, who regarded the successful issue of the American expedition as a matter of the utmost importance, boldly set aside the claims of seniority, and selected for the command the officer whom he believed to be of all the most fitted. Lord Mahon relates a curious anecdote connected with his appointment which, as he observes, "affords a striking proof how much a fault of manner may obscure and disparage high excellence of mind." . . . . "After Wolfe's appointment, and on the day preceding his embarkation to America, Pitt, desirous of giving his last verbal instructions, invited him to dinner.—Lord Temple being the only other guest. As the evening advanced, Wolfe, heated perhaps by his own aspiring thoughts and the unwonted society of statesmen, broke forth into a strain of gasconade and bravado. He drew his sword—he rapped the table with it—he flourished it round the room—he talked of the mighty things which that sword was to achieve. The two ministers sat aghast at an exhibition so unusual from any man of real sense and real spirit; and when at last Wolfe had taken his leave, and his carriage was heard to roll from the door, Pitt seemed for the moment shaken in the high opinion which his deliberate judgment had formed of Wolfe: he lifted up his eyes and arms, and exclaimed to Lord Temple, 'Good God! that I should have entrusted the fate of the country and of the administration to such hands!'" This story was told by Lord Temple himself to a near relative, the Right Hon. Thomas Grenville. It confirms, as Lord Mahon very truly remarks, "Wolfe's own avowal that he was not seen to advantage in the common occurrences of life, and shows how shyness may at intervals, as it were, for refuge, into the opposite extreme."

The embarkation arrived at the Isle of Orleans on the 27th of June, and Wolfe at once set about constructing batteries at the points of Levis and the Isle of Orleans, whence his artillery could play upon Quebec. In August Wolfe issued a proclamation to the Canadian peasants, informing them that his forces were masters of the river, while a powerful army, under General Amherst, threatened their country from the interior; calling upon them to observe a strict neutrality during the struggle between the French and English crowns, and promising to protect them in their possessions and the exercise of their religion. Montcalm had concentrated all the forces he could raise in the province in Quebec, which he had fortified in a masterly manner. The months of July and August were spent in repeated unsuccessful attempts to drive the French from their advantageous post at the mouth of the Montmorenci. On the night between the 12th and 13th of September Wolfe landed his troops—reduced by sickness and losses, and by the necessity of leaving behind a force sufficient to defend Point Levis and the Isle of Orleans, to 3600 men—immediately above Quebec, and, favoured by the night, ascended the hills which command that city from the west. Montcalm, when he learned that the English were in possession of these heights, saw at once that nothing but a battle could save the town, and took his measures accordingly. The battle was strenuously contested, but the French at length gave way. Montcalm and Wolfe fell in the action, and their second in command were both dangerously wounded, and obliged to leave the field before the fate of the day was decided. From the spot to which he had been conveyed, Wolfe "from time to time lifted his head to gaze on the field of battle, till he found his eyesight begin to fail. Then for some moments he lay motionless, with no other sign of life than heavy breathing or a stifled groan. All at once an officer who stood by exclaimed, 'See, how they run!' 'Who run?' cried Wolfe, eagerly raising himself on his elbow. 'The enemy,' answered the officer; 'they give way in all directions.' 'Then God be praised!' said Wolfe, after a short pause; 'I shall die happy.'—These were his last words; he again fell back, and, turning on his side, as if by a sharp convulsion, expired. He was but thirty-three years of age, when thus—the Nelson of the army—he died amidst the tidings of the victory he had achieved." The Marquis de Montcalm "was struck by a musket-ball while gallantly endeavouring to rally his men. He was carried back into the city, where he expired next day. When told that his end was approaching, he answered, in a spirit worthy the antagonist of Wolfe, 'So much the better; I shall not live then to see the surrender of Quebec.'" (Mahon). The French lost in the engagement 1500 men; the Irish 600. Five days after the action Quebec surrendered, and Canada was lost to France.

The feature of Wolfe's character most dwelt upon by his contemporaries was his ardent and fearless spirit of enterprise. His thorough knowledge of his profession, and skill as a disciplinarian, however, the pains he took to ascertain the real state of affairs at Rochefort, and the arguments by which he supported the proposal of a descent, and, above all, his letter addressed to the prime minister from his headquarters at Montmorenci, on the 3rd of September, show that this quality was combined with an observant and deliberate mind. Enterprise was with Wolfe the result of perfect and laboriously-attained knowledge of his position.

The death of Wolfe made a deep impression in England. The most touching instance is mentioned by Burke:—"A little circumstance was talked of at that time, and it deserves to be recorded, as it shows a fineness of sentiment and a justness of thinking in the lower kind of people that is rarely met with, even among persons of education. The mother of General Wolfe was an object marked out for pity by great and peculiar distress; the public wound pierced her inmost with a peculiar affliction, who had experienced the dutiful son, the amiable domestic character, whilst the world admired the accomplished officer. Within a few months she had lost her husband; she now lost his son—her only child. The populace of the village where she lived unanimously agreed to admit no illuminations or fireworks, or any other sign of rejoicing whatsoever near her house, least they should seem, by an ill-timed triumph, to insult over her grief. There was a justness in this, and whoever knows the people know that they made no small sacrifice on this occasion." The remains of Wolfe were brought to England and interred at Greenwich. A monument was erected to his memory in 1760 by the gentlemen of his native parish. A public monument in Westminster Abbey was voted by the House of Commons in 1759, and opened to the public in 1773; a marble statue was voted by the Assembly of Massachusetts. A column marks the spot where Wolfe received his death wound; and recently an obelisk 60 feet high has been erected in a conspicuous position in the government grounds at Quebec overlooking the site of the battle, having on one of its faces inscribed the name of Wolfe and on the other that of Montcalm.

There is still no good life of Wolfe, nor has his Correspondence, which is known to exist, been given to the world. It would be

Digitized by Google

instructive to the military man, for his character as a soldier was almost perfect, though the field in which his talents were developed was a narrow one. The task was undertaken by Southey, and afterwards by Gleig, but relinquished by both from unexplained difficulties which intervened. In the third volume of 'Glasgow, Past and Present,' published at Glasgow in 1856, are printed thirteen letters by Wolfe (some of which appeared in a less complete form in 'Tait's Magazine' for 1849). They are of a very interesting character, and are accompanied by a brief memoir, in which several new facts are stated. Much information respecting Wolfe (in good part the result of inquiries started by the author of the memoir just mentioned) will be found in 'Notes and Queries,' vols. iv. to xii. inclusive.

*WOLFF, EMIL, an eminent German sculptor, was born in Berlin about 1800. He studied under Rudolf Schadow, in the Art Academy of that city, where he gained the prize in 1821 for a relievo of 'David playing on the Harp before Saul.' He then proceeded to Rome, where he for some time studied under Thorwaldsen. Having fixed on Rome as his permanent residence, he has continued diligently occupied in the quiet pursuit of his art, finding ample patronage among foreigners as well as his countrymen, and gradually working his way to a place among the leading artists of the Roman capital. A large part of his attention has been given to classical subjects, into the spirit of which his thorough study of antique art has qualified him to enter, and which he renders with purity of form, and elevation of style. His religious pieces are also much admired; and he has executed some homely subjects with much success, of which his 'Peasant Maiden with a Lamb' is a happy example. Among his classic works may be mentioned his relievi of 'Midas,' and 'Charity;' and his statues of 'Hercules,' 'Prometheus,' 'Diana,' 'Pandora,' and 'Melenger;' his groups of 'Achilles and Thetis,' 'Telephus suckled by a Hind,' the 'Death of Patroclus,' 'Amazons,' 'Victory narrating to youth the deeds of heroes,' &c. Of a different order are his life-sized group, 'Jephtha and his Daughter,' and his popular statuette of 'Winter.' Wolff enjoys considerable reputation as a portrait sculptor; he has executed busts of the sculptors Thorwaldsen and Schadow; of Niebuhr; Winckelmann; Angelo Mai; Palestrina, &c. In 1841 he visited England, when he was commissioned by her Majesty to execute companion statues of the Queen and Prince Albert (the latter in Grecian costume), a bust of the Princess Royal, &c. Casts of several of Wolff's statues are in the Crystal Palace at Sydenham. He is a member of the Academy of Arts at Berlin.

WOLFF, JOHANN CHRISTIAN VON, a celebrated German mathematician and philosopher, was born at Breslau, January 24, 1679, and at an early age showed a taste for the acquisition of knowledge. His father, who was a brewer, sedulously encouraged this disposition; he became his first preceptor, and having instructed him in the Latin language, he sent him to the public school of the town, in order that he might have the benefit of the best masters which it afforded. The youth there studied diligently his philosophy of the age, and he acquired such a facility in the practice of disputing, that he is said to have become the rival of his tutors; but before he was twenty years of age, having obtained information of the revolution which the writings of Descartes had begun to produce in the schools, he was actuated by a strong desire to become acquainted with them. The result of his application to the Cartesian philosophy was a determination to cultivate mathematical science for the purpose of founding on its principles a system of metaphysics. With this object in view he passed through a course of mathematics at the university of Jena, and he afterwards went to Leipzig, where he resided during the space of four years. Here, in 1703, he began to deliver lectures; and in the same year he published two tracts, one entitled 'De Rotis Dentatis,' and the other 'De Algorithmo Infinitesimali Differentiali.' The ability displayed in these dissertations procured for Wolff the esteem and friendship of the learned men of his country; he became intimate with Tschirnhausen and Leibnitz, and by them he was encouraged in his views of giving to Germany a national philosophy which might replace that of Aristotle as then understood. He at first intended to enter the church as a profession, but he was finally induced to seek an appointment in fulfilling the duties of which he might continually advance his knowledge of the sciences. He became therefore a candidate for a professor's chair, and in 1707 he was appointed to give instruction in pure and mixed mathematics in the University of Halle. It was while he held this post that he wrote his tract entitled 'De Methodo Mathematica,' and his 'Elementa Matheseos Universæ,' of which last work an enlerged edition was published at Geneva between the years 1732 and 1741, in five volumes, 4to. The first volume contains the following subjects:—'Commentatio de Methodo Mathematica; Arithmetica; Geometria; Trigonometria plana et sphærica:' the second, 'Mechanica cum Statica; Hydrostatica, &c.:' the third, 'Optica; Perspectiva atque Astronomia:' the fourth, 'Geographia; Chronologia; Gnomonica; Pyrotechnia et Architectura:' and the fifth, 'Commentatio de Præcipuis Scriptis Mathematicis, &c. He also published at Leipzig and Frankfort, in 1728, 'Tabulæ Sinuum atque Tangentium tam naturalium quam artificialium, una cum Logarithmis numerorum vulgarium, &c.' Being made a member of the Philosophical Society at Leipzig, he wrote several memoirs relating to mathematics and physics, which were inserted in the 'Acta Eruditorum,' and in 1710 he was elected a Fellow of the Royal Society of London.

But the life of Wolff was almost wholly devoted to the study of metaphysical and moral philosophy; and between the years 1712 and 1723 he wrote his 'Thoughts on the Powers of the Human Mind; on the Deity and the Universe; on the Operations of Nature; on the Search after Happiness;' and, as a sequel to the last, 'Thoughts on Society as a means of advancing Human Happiness.' These works were published separately in the German language, a medium till then unemployed in treating such subjects. At a later period he published in the same language a Dictionary of Mathematics.

While thus employed, and while his talents were procuring for him invitations to occupy the chairs of philosophy at Wittenberg, Leipzig, and St. Petersburg, a serious opposition to his persuasions writings began to manifest itself in the university of which he was so distinguished a member. This is supposed to have arisen from the intrigues of the theological professors, one of whom conceived a violent dislike to Wolff because the latter, who held the post of dean of the faculty of theology, declining to receive his son on the ground of incapacity, had appointed Thümmig, one of his own pupils, to be his assistant. In such circumstances subjects of accusation are not long wanting, and Wolff was charged with endeavouring to subvert the proofs of the existence of the Deity, and to disturb the religious belief of the students in the university, while his metaphysical principles were violently criticised by Stahler in a work which was published at Jena. It happened also that Wolff, in one of his lectures, had spoken highly in favour of the moral precepts of Confucius, which had been recently known to the people of Europe through the researches of the Jesuit missionaries in the East; and this approbation of the doctrines of a heathen philosopher was considered as a crime, though Wolff was so far from being aware of giving cause of offence, that, as he states in his letter to the minister at Berlin, he intended to publish his discourses at Rome with the consent of the inquisition. The King of Prussia, being instigated by some of the military authorities, who represented that the sentiments of Wolff might become dangerous to the state by holding out to the soldiers an excuse for desertion, suddenly deprived him of his appointment, and issued an order that he should quit the kingdom in two days. Wolff accordingly, November 3, 1723, left Halle and went to reside at Cassel, where he was kindly received by the landgrave, who conferred on him the title of councilor, and appointed him professor of mathematics and philosophy at Marburg. There he resided about eighteen years, and during that time he published his metaphysical works. The first and greatest of these is entitled 'Philosophia Rationalis, sive Logica methodo scientifica pertractata,' 4to, 1728. The others are, 'Psychologia Empirica, &c., 4to, 1728; 'Philosophia prima, sive Ontologia, &c.,' 4to, 1730; 'Cosmologia Generalis,' 4to, 1731; 'Psychologia Rationalis,' 4to, 1734; 'Theologia Naturalis,' 4to, 1737; 'Philosophia Practica Universalis,' 4to, 1738-39; and 'Philosophia Moralis, sive Ethica,' 4to, 1732.

Amidst these labours Wolff found time to write in defence of his doctrines, and by degrees the violence of his antagonists began to abate. Among them there were many who disapproved of the strong measures which had been adopted against him, and there were some who desired his return in the hope of promoting a revival of metaphysical science and literature in Prussia. Frederick the Great, succeeded the throne, appointed commissioners to examine Wolff's writings and inquire into the cause of his banishment, and the report being favourable, he was in 1733 invited back to Halle; the invitation was repeated six years afterwards, but it was not till 1741 that it was accepted. Wolff had been, in 1725, appointed an honorary member of the Academy of St. Petersburg; and in 1733 he was elected a member of the Académie des Sciences at Paris.

On his return to Halle he was made privy-councillor, vice-chancellor, and professor of international law of the kingdom, afterwards made Chancellor of the University, and by the elector of Bavaria the dignity of a Baron of the Empire was conferred upon him. It is said however that Wolff had the mortification to perceive that his lectures were not well attended; either age had diminished his powers, or, as is supposed, his numerous writings being in the hands of all the German students, his oral instructions were no longer necessary. Being attacked by gout in the stomach, he died, having borne his sufferings with fortitude and Christian piety, April 9, 1754, in the seventy-sixth year of his age.

The merit of Wolff consisted in a correct and methodical arrangement of the subjects of philosophical science, rather than in discovery. He borrowed freely from his immediate predecessors, Descartes and Leibnitz, and even from the writers of the Aristotelian school; and, having a learned desire to combine utility with truth, he endeavoured to reduce the apparently heterogeneous elements under one system. That he completely succeeded in this difficult task it is too much to say; entertaining the project of introducing in philosophical investigations the precise methods which are employed in mathematics, he appears to have overlooked the want of homogeneity in the elements of the former branch of science, which renders it impossible to arrive at conclusions by purely abstract reasonings. In stating a philosophical proposition which perhaps is self-evident, he often exhibits a tedious demonstration in order that he may show its dependence on some more general theorem which precedes it; and his developments are remarkable for their extraordinary prolixity.

Digitized by Google

Wolff divides human knowledge into three parts, historical, philosophical, and mathematical: in the first he includes everything relating to material as well as immaterial beinr, that is, whatever is cognisable by the senses or by internal conviction. The second he considers as comprehending the reasons of things; and he states its object to be the explanation of the reason that what is possible may be realised. His third division constitutes the knowledge of quantity. He divides psychology into two kinds, which are designated rational and empirical, and the former is distinguished from the latter as the science of things possible relatively to the soul only. He defines science in general, the faculty of demonstrating.

He appears to have formed but an imperfect idea of the connection of the sciences, his taste leading him to seek the grounds of their connection only in their being deduced from first principles, which he conceived to exist in the human understanding; and his criterion of truth consisted in the thing predicated being in accordance with the idea of the subject. His dissertations on the employment of hypotheses, and on the deductions drawn from experience, are the developments of a few general maxims, very just, but trite; and his views on the liberty of philosophising are sound, though, at the time they were written, they appeared too bold.

His metaphysical theory maintained its ground in Germany from the death of Leibnitz to the time when the school of Kant was formed. He is considered as the disciple and commentator of the former philosopher; and he admitted a sort of pre-established harmony from whence results the conformity of the operations of the soul with those of the body, but he differed from his master in considering that harmony not as a result of the will of the Deity, but of the changes which are continually in operation in the universe. The latter he considered as a piece of mechanism set in motion by its first cause. He demonstrates at length the existence of God, taking care at the same time to separate the idea of the Divine Being from that of the soul of the world; and he maintained the opinion that the Author of the universe being all-perfect must have necessarily created the best of all possible worlds. Asserting also the perfect freedom of man's will, he admits that this freedom is limited to the power of choosing what appears to be the best under existing circumstances.

His general rule of morality is, that each man should, as much as depends on himself, do what may render his own condition and that of others as perfect as possible. While acknowledging that God is the source of all morality, he considers that man is in some respects a law to himself; that an action is good or bad in itself, independently of divine precepts, and that the conduct of man ought not to be influenced merely by the fear of punishment or the hope of reward. Natural law is in his mind identical with morality, and he makes both to depend on the obligation man is under to advance constantly towards perfection.

Wolff's political science is founded on the principle that everything should be done for the public benefit and the maintenance of public security: he considers a limited monarchy as the most favourable for the attainment of these ends, though he admits that this is not without some inconveniences. He leaves to the prince the right of determining what is best for the public good, but he makes him subject to the laws of his country. He inquires into the causes of the wealth of nations, but his views on this subject are confined chiefly to the state of society in his own age, and want the generality which is consistent with the present state of this branch of science.

His political works are, 'Jus Naturæ,' viii. tom. 4to, Francofurti et Lipsiæ, 1732; and 'Jus Gentium,' 1749, 8vo.

(Ludovici, *Vita, facta et scripta. Ch. Wolfii*, Leipsig)

WOLFF, PIUS ALEXANDER, one of the most distinguished German actors of the present century, was born in 1782, at Augsburg. His parents designed him for one of the learned professions, but his own inclination, as well as his natural talents, led him to the stage. In 1804 he was one of the actors engaged at Weimar, the theatre of which place was then regarded as the model for all Germany. Schiller and Göthe were themselves actively engaged in conducting the theatre and training the actors. As Wolff was a man of much greater talent than the majority of actors, Göthe took especial trouble with him, trained him on sound artistic principles, and afterwards declared that if Wolff had become an actor quite to his mind, Wolff devoted himself especially to the performance of tragic characters and youthful heroes, which he acted to perfection. His performance of Hamlet, the Marquis Posa, Max. Piccolomini, Wetzilingen, Orestes, and Tasso, made such an impression in Germany, that to this day he is considered the standard by which other actors are measured. At a later period he occasionally also acted comic and humorous characters, in which he was much admired, though tragedy was at all times his peculiar field, in which he was unsurpassed. In 1816 he became a member of the royal theatre of Berlin.

He died at Weimar in 1828. During the latter years of his life he wrote several dramas, which were well received, and some of which long remained favourite plays in Germany. Three of them, 'Cæsario,' a comedy, 'Pflicht um Pflicht,' and 'Precious,' form the first volume of a collection which he published under the title 'Dramatische Spiele,' Berlin, 1823, but the collection was not continued, and his other plays appeared separately at different times. 'Precious' has become celebrated by being taken by C. M. von Weber as the text for one of his most popular operas. His other plays are—'Der Hund des Aubri,' a farce, (Berlin, 1822); 'Der Mann von fünfzig Jahren' (Berlin, 1830); 'Treue siegt in Liebesnetzen,' and 'Der Kammerdiener' (Berlin, 1832).

WOLFRAM VON ESCHENBACH, a Minnesänger, who lived in the first part of the 13th century, was the best German poet of his time. He was probably born at a castle called Eschenbach, which seems to have been situated in the Upper Palatinate, and he was descended from a noble family. After having been made a knight, he led the life of a warlike troubadour, and the princes of the empire received him with equal satisfaction in their camp and at their court. He was present at the famous poetical festival on the Wartburg. Towards the end of his life he retired to his native country: he died probably about 1220: he is spoken of as dead in 1225.

Wolfram von Eschenbach was a very fertile poet. Of his numerous productions the greater part however are lost, but his principal poem has most luckily been preserved in manuscript at St. Gallen and at some other places. This poem is entitled 'Parzival;' the subject of it is partly taken from French and Provencal models—the holy Grail being the marvellous object which the hero of the poem, Parzival, pursues in a long course of adventures. He at last becomes king of the Gral, and thus enjoys the purest happiness and perfection which man can attain. There is an epical tendency in the poem, but it would be incorrect to call it an epic: full of deep thoughts on the destiny of man, on the mysterious nature of his soul, on his religious and moral duties, it belongs to a class of poems which are peculiar to German literature, and of which Göthe's 'Faust' may be considered as the most striking specimen. The 'Parsival' was written about 1205. It was first printed in 1477, in a very incorrect and mutilated edition, which was reprinted and somewhat corrected in the first volume of 'Sammlung Altdeutscher Gedichte,' by Müller, who collated the manuscript of St. Gallen. The other extant works of Wolfram of Eschenbach are, 2, 'Titurel,' first printed in 4to, 1477, a fragment of an introductory poem to Parzival, and in Gervinus's opinion the finest specimen of ancient German poetry, which must not be confounded with another poem, likewise called 'Titurel,' which was once incorrectly attributed to Wolfram; 3, 'Willehelm von Orangis' (William of Orange), in Manesse's collection of Minnesingers, where there are also several of the author's minor lyrical poems. An excellent critical edition of all the extant productions of Wolfram von Eschenbach was published by Lachmann, Berlin, 8vo, 1833, who has added a valuable introduction to the Life and Works of the author. Wolfram, according to contemporary writers, was a very learned man; his style is simple, clear, and elegant, and the difficulties which exist are rather due to the mystical tendency of the author and his transcendental ideas, than to a want of those qualities which constitute a great writer.

WOLLASTON, WILLIAM, author of 'The Religion of Nature Delineated,' was born at Coton-Clanford in Staffordshire, on the 26th of March, 1659. He was descended from an old and considerable Staffordshire family, but belonged to a younger and a poor branch of it. He received his early education, that is, a Latin school education, at Shenston in Staffordshire, where his father, a private gentleman of a small fortune, then resided, young Wollaston was immediately sent to it. He continued there near two years, when he was sent to Litchfield school, in which a great confusion soon after happened, and the magistrates of the city turned the master out of the schoolhouse. Many scholars followed the ejected master; and Mr. Wollaston amongst the rest. He remained with him till he quitted his school, which was about three years; and then, the schism being ended, he returned into the free-school, and continued there about a year. This was all the schooling Mr. Wollaston ever had. (Clarke's 'Life of Wollaston,' prefixed to his edition of the 'Religion of Nature,' 8vo, 1750, p. v.) On the 18th of June 1674, he was entered a pensioner at Sidney Sussex College, Cambridge, where he resided almost without interruption until the 29th of September 1681, by which time he had taken his Master of Arts' degree and deacon's orders. He was disappointed in not obtaining a fellowship in his college, for which he had laboured with great diligence, and in the hope of obtaining which he had submitted to much inconvenience from poverty during his residence in the university. On leaving college he took the situation of assistant-master at Birmingham school, and shortly after he joined the school he obtained a lectureship in a chapel two miles out of Birmingham. After having filled the situation of assistant-master for about four years, he was appointed second master of the school, which had three masters and two assistant-masters, and at the same time took priest's orders. This mastership was worth only 70*l.* a year. Out of his small income he was able to give assistance to two brothers who had got into difficulties.

In August 1688, the poor schoolmaster suddenly found himself in affluence by the death of a second cousin, the head of his own branch of the Wollaston family, Mr. Wollaston of Shenton. In Leicestershire, who greatly to his own surprise made him his heir. This gentleman had not long before his death lost his only son, and not choosing to give his estate to his daughters, proceeded to settle it on the uncle and father of the subject of this sketch. But a further acquaintance with his younger relative, and the high character which he heard of him, led him before his death to revoke this settlement and make

Digitized by Google

another. "His cousin of Shenton was used to employ persons privately, to observe our author's behaviour, who little suspected any such matter. And his behaviour was found to be such, that the stricter the observations were upon it, the more they turned to his advantage. In fine, Mr. Wollaston became so thoroughly satisfied of our author's merit, that he revised the before-mentioned settlement and made a will in his favour." (Clarke's 'Life,' p. xi.)

Wollaston now went to reside in London, and on the 26th of November, 1689, married a daughter of Mr. Nicholas Charlton, a citizen of London, who brought him another accession of fortune. He now devoted himself entirely to the enjoyment of domestic happiness and the pursuit of learning. "He may most truly be said," observes his biographer, "to have settled in London, for he very seldom went out of it. He took no delight in unnecessary journeys, and for above thirty years before his death had not been absent from his habitation in Charterhouse square so much as one whole night." (p. xiv.) His studies were principally directed to the ancient languages, and morals and theology, and embraced mathematics and natural philosophy, and the Arabic language. In 1690 he published a paraphrase of a part of the 'Book of Ecclesiastes,' and in 1703 he composed and printed, but only for private circulation, a small Latin grammar. This 'Religion of Nature Delineated' was published in 1724, but a very short time before his death. A number of other works, which he had written during his four-and-thirty years' studious residence in London, were committed by him to the flames a short time before his decease. The following is a list of manuscripts which were found after his death, and which his biographer supposes escaped the same fate only by their being forgotten:—1, 'A Hebrew Grammar; 2, 'Tyrocinia Arabica et Syriaca;' 3, 'Specimen Vocabulorum Biblico-Hebraici, literis nostratibus quantum fieri Linguarum Dissonantia describi;' 4, 'Formulæ quædam Gemarinæ;' 5, 'De Generibus Pedum, Metrorum, Carminum, &c. apud Judæos, Græcos, et Latinos;' 6, 'De Vocum Tonis Monitio ad Tyrones;' 7, 'Rudimenta ad Mathesin et Philosophiam spectantia;' 8, 'Miscellanea Philologica;' 9, 'Opinions of the Ancient Philosophers;' 10, '*Isodaïa*, sive Religionis et Literaturæ Judaicæ Synopsis;' 11, 'A Collection of some Antiquities and Particulars in the History of Mankind, tending to show that Men have not been here upon this Earth from Eternity,' &c.; 12, 'Some Passages relating to the History of Christ, collected out of the Fathers;' 13, 'A Treatise relating to the Jews, of their Antiquities, Language, &c.' Besides these there was a numerous collection of sermons found. From the titles it may be supposed that many of these manuscript works were composed to assist his own studies. "What readers the more probable," says Dr. Clarke, "or indeed almost beyond doubt, that he would have destroyed these likewise if he had remembered them, in that several of those which remain undestroyed are only rudiments or rougher sketches of what he afterwards reconsidered and carried on much further, and which soon after several of the nervous infirmities incitted to the fames, as being still, in his opinion, short of that perfection to which he desired and had intended to bring them." (p. xxiii.)

Wollaston died on the 29th of October 1724, in his sixty-sixth year. The immediate cause of his death was a fracture of the arm, which happened when he was in a low state of health. His wife survived four years before. They had lived most happily together for thirty years, and she had borne him eleven children, of whom seven survived their father. He was buried by the side of his wife in the church of Great Finborough in Suffolk, where one of his estates lay, and where his eldest son afterwards resided.

'The Religion of Nature Delineated' is, as the name implies, an exposition of man's various moral duties and the principles of them, independently of revelation, and of so much as may be learnt without revelation of the divine government of the world. The chief peculiarity of Wollaston's system of morals is that he refers all duties to truth as their fundamental principle, defining truth to be the expression of things as they are, and extending the definition by the remark that "a true proposition may be denied, or things may be denied to be what they are by deeds as well as by express words, or another proposition." As an instance, theft would be interpreted by Wollaston as a denial of the true owner's property in the goods stolen. On this somewhat fanciful foundation the whole range of human duties, with the exception of course of those arising out of revealed religion, is built up by Wollaston with great ingenuity and skill. The work is not complete: the author sets out with proposing to himself three questions to be answered:—1, "Is there really any such thing as natural religion, properly and truly so called?" 2, "If there is, what is it?" and, 3, "How may a man qualify himself, so as to be able to judge for himself, of the other religions professed in the world; to settle his own opinions in disputable matters; and then to enjoy tranquillity of mind, neither disturbing others, nor being disturbed at what passes among them?" Only the first two of these questions are answered. Wollaston had begun to answer the third question, but had made little progress, when death overtook him.

The work was very popular on its first publication; ten thousand copies of it, according to Dr. Clarke, having been sold in a very few years. The best edition is the seventh and last, to which is prefixed the biographical sketch, by Dr. Clarke, whence this account has been principally derived, and which was edited by him at the request, as he states in an advertisement, of Caroline, the wife of George II.

WOLLASTON, WILLIAM HYDE, M.D., F.R.S., a distinguished cultivator of natural science, was born August 6th, 1776. He was the third son of the Rev. Francis Wollaston, F.R.S., of Chiselhurst in Kent, and rector of St. Vedast, Foster-lane, in the city of London, who was himself the grandson of the author of the 'Religion of Nature Delineated,' the subject of the preceding article. A peculiar taste for intellectual pursuits of the more exact kind appears to have been hereditary in his family. He was an astronomer, and published, in 1789, a 'Specimen of a General Astronomical Catalogue, arranged in Zones of North Polar Distance, and adapted to January 1, 1790.' He also produced, from his own observations, an extensive catalogue of the northern circumpolar stars, which, with an account of the instruments employed, tables for the reductions, and some miscellaneous papers, was published under the title of 'Fasciculus Astronomicus,' in 1800. His eldest son, the Rev. Archdeacon Francis John Hyde Wollaston, B.D., F.R.S., was also a man of science, and constructed a thermometrical barometer for measuring heights, on which he communicated two papers to the 'Philosophical Transactions,' in the years 1817 and 1820.

W. H. Wollaston having gone through the usual preparatory course of education, was sent to Caius College, Cambridge, where he applied himself diligently to the studies immediately relating to the medical profession, for which he was intended, and where he took the degree of Doctor in Medicine in 1793: in the same year he was elected a Fellow of the Royal Society, to whose 'Philosophical Transactions,' during his life, he communicated many papers of the highest importance, and in 1806 he was chosen one of its secretaries, an office which he retained for some years. On the decease of Sir Joseph Banks, in 1820, he was appointed president of the society until the anniversary election of that year. He was for many years a member of the Board of Longitude, and remained such until its improvident abolition by the government shortly prior to his decease; and he had been an early member and office-bearer of the Geological Society.

After premonitory symptoms of paralysis for many months, he died of an effusion of blood in the ventricles of the brain, on the 22nd of December 1828.

Dr. Wollaston had entered into practice as a physician, and for a time resided at Bury St. Edmunds: he afterwards removed to London, and it should have been supposed that in this city his talents would procure for him an extensive reputation; but either because his success was not equal to his expectations, or in consequence of the disappointment which he felt in not obtaining the post of physician to George's Hospital, Dr. Pemberton having been on this occasion preferred to him, he determined to quit the profession, and forthwith himself wholly to the pursuit of science. It is possible that the effects of another cause may have contributed to this determination, either in his own mind or in the minds of his friends. The peculiarities of his temper and deportment, as exhibited in the practice of the healing art [ABERNETHY, JOHN], as exhibited to his patients, have already been noticed. It was long ago remarked in conversation, by an experimental philosopher of great eminence, and a junior contemporary of Dr. Wollaston, that in the practice of medicine, he would, from some of his own characteristics, have been "still more disagreeable than Abernethy."

The researches of men of science, however important they may have been to mankind by the improvements to which they have led in the arts and manufactures, have seldom been productive of immediate benefit to those who first conducted them: some more fortunate person, by seizing on an original idea already propounded, and bringing it down to the level of a practical application, has thereby acquired both fame and fortune; while the original discoverer has remained unnoticed, and perhaps even his name has been forgotten. This was not the fate of Dr. Wollaston, in whom were combined the genius of the philosopher and the skill of the artist; since from his different discoveries, and particularly from his method of manufacturing platinum, he acquired a considerable fortune. No one however could have better deserved the rewards due to genius and industry; for not only were the qualities of his mind of a high order, but his application to philosophical investigations and experiments was unremitting: even when near his last moments, though suffering under a painful malady, he had the fortitude to dictate an account of some of his most important unpublished researches, in the benevolent hope that a knowledge of them might thus be preserved for the benefit of mankind.

Among the papers so produced, was 'The Bakerian Lecture.—On a method of rendering Platina malleable,' which appears in the 'Philosophical Transactions' for 1829. With the exception of one remarkable precaution, slightly mentioned in his paper 'On a new metal [Rhodium] found in crude Platina,' communicated to the Royal Society, and published in the same work a quarter of a century before, (being the first in which he treated of platinum and the metals which accompany it,) no account of the process he employed in the manufacture of that metal had hitherto been made public. In the Bakerian lecture it is described with the perspicuous brevity always characteristic of his style, but so as to enable any competent person to put it in practice. It consists, essentially, in the first place, in the treatment of the crude metal, often termed the ore of platinum, by aqua regia of a certain strength, and the precipitation of that metal from the resulting solution by sal-ammoniac,—a process long well-known,—the careful washing of

Digitized by Google

the ammonio-muriate of platinum (in more modern chemical language, the double chloride of ammonium and platinum) so obtained, and its heating, with the utmost caution, and with so low a heat as just to expel the whole of the elements of the sal-ammoniac, and to occasion the particles of platinum to cohere as little as possible; for on this depends the ultimate ductility of the metal. In the next place, the resulting gray product of platinum is to be rubbed to powder or ground, well washed and diffused in water, and allowed to subside into a uniform mud or pulp, which is to be transferred to a brass mould, and subjected in that to forcible compression. Finally, the cake of platinum thus produced, is to be exposed to the most intense heat that a wind furnace (in Dr. Wollaston's time) could be made to receive, and struck, while hot, with a heavy hammer, so as at one heating effectually to close the metal, or the particles into a solid mass; which may then be forged into an ingot and subsequently subjected to any process of manufacture.

The first introduction of the continued mechanical pressure of the reduced platinum before it is heated for the purpose of welding it together, as an essential part of the process for obtaining the metal in a malleable state, was claimed in private, by the late Mr. Thomas Cock, a practical metallurgist, and a member of the British Mineralogical Society, noticed in a former article [Phys. W. II.] with Mr. Fryer, Messrs. A. and C. R. Aikin, Dr. Babington, Mr. R. Phillips, and other chemists and mineralogists. He also affirmed that it was originally proposed by him to Dr. Wollaston, who effected by a lever-press of peculiar construction, which he devised for the purpose (and described in the Bakerian lecture for 1829) what Mr. Cock, according to his own statement and to an account of the process communicated by him to Messrs. Aikin's 'Chemical Dictionary,' had previously effected by a screw-press.

The welding together of the platinum without the addition of any other metal or substance, stated by Leopold Gmelin in his 'Handbook of Chemistry' to characterize Dr. Wollaston's method as distinguished from the inadequate processes before adopted for obtaining it in a malleable state, is common to the processes of the late Mr. Richard Knight (also a member of the British Mineralogical Society, and afterwards F.G.S.) Mr. Cock and Dr. Wollaston, and was probably first employed by Mr. Knight. It certainly belongs to English chemists of the beginning of the present century. In Dr. Wollaston's hands however every part of the process received the impress of the peculiar combination of comprehensive views with minute accuracy in particulars by which he was distinguished. He made it to result in the most undeniable manner, and all the preceding methods have been entirely superseded by his. Every student of chemistry, and every practical chemist may profitably study the Bakerian lecture as a model of the application of Chemistry and Physics by an operator extensively and accurately versed in both, to effect a single object of great importance.

It is right to say, in conclusion of this subject, that Dr. Wollaston did not claim the invention of the method which he practised; he simply stated as the reason for describing it, that, from long experience, he was better acquainted with the treatment of platinum, so as to render it perfectly malleable, than any other member of the Royal Society. But of some of the most refined, philosophically conceived, and efficacious portions of it, he was undoubtedly the originator. The late Dr. Thomas Thomson, F.R.S., the author of the celebrated 'System of Chemistry,' and Regius Professor of that science in the University of Glasgow, remarks in his 'History of Chemistry' (forming part of the 'National Library,' of which a few volumes appeared), that it was Dr. Wollaston who first succeeded in rendering platinum "into ingots in a state of purity, and fit for every kind of use:" that "it was employed, in consequence, for making vessels for chemical purposes;" and that "it is to its introduction that we are to ascribe the present accuracy of chemical investigations. It has been gradually introduced," he continues, "into the sulphuric acid manufactories, as a sub-titute for glass retorts."

The use of platinum vessels for the final concentration of sulphuric acid by distillation, had been practised on a small scale by a manufacturing chemist named Sandman, a member of the British Mineralogical Society; but Mr. Richard Farmer was the first sulphuric acid maker who adopted it, and this he did on the large scale, at his works, still carried on by his near connection Mr. Edward Probart, on Kennington Common, London. In 1809 he engaged Dr. Wollaston to superintend the construction for the purpose of a large vessel of his own platinum, weighing 322¼oz. troy, at the cost of 300£; and this proving of the anticipated advantage, two other vessels were constructed in the course of the following six years, having the aggregate weight of 628 oz., and costing together 682£. Dr. Wollaston afterwards constructed similar large vessels of platinum, for other sulphuric rectifiers of sulphuric acid. From his correspondence with Mr. Farmer, which we have been kindly permitted to examine, it appears that the method of transacting business pursued by Dr. Wollaston in such cases, was to charge per oz. for the platinum he supplied,—and of which metal indeed he was for many years, nearly throughout his life, the sole manufacturer—and in addition, the actual sums disbursed in payment of workmen, for the fabrication of the vessels, but not to receive any remuneration for his own superintendence, which however was of the most effective description. When he proposed to manufacturers or tradesmen improvements in chemical processes, or in the construction of instruments or apparatus, he contracted to receive nothing, if they should prove unsuccessful, but to be paid a certain proportion of the savings or profits, in the event of their succeeding. In making a profitable business of practical science, he thus never abandoned the character of a professional man and a master-manufacturer, but always maintained the position of a gentleman.

In giving a biographical sketch of Dr. Wollaston, it will be proper to allude more particularly to some of the memoirs which he contributed to the Transactions of the Royal Society: we cannot, we believe, more effectually perform this duty than by quoting what has been said of his varied labours by his contemporaries and friends Mr. Brande and Dr. Thomson. The former remarks that the accumulation of the theory of definite proportions "in this country is chiefly to be attributed to Dr. Wollaston, who-e admirable suggestion of a synoptic scale of chemical equival-nts was brought before the Royal Society in November 1813. Many years previous to this he had established the important doctrine of multiple proportions, in a paper 'On Super-acid and Sub-acid Salts,' printed in the 'Philosophical Transactions' for the year 1808: he now showed the important practical applications of which the theory was susceptible, and by connecting the scale of equivalents with Gunter's sliding rule, has put into the hands of the chemist an instrument infinite in its uses, and equally essential to the student, the adept, and the manufacturer."

"Dr. Wollaston's first contribution to the Transactions of the Royal Society was in June 1797, being an essay 'On Gouty and Urinary Concretions,' in which he ascertained the known several compounds connected with the production of those maladies, in addition to the uric combinations previously discovered by Scheele: these were, phosphate of lime; ammonio-magnesian phosphate, a mixture of the two forming the *fusible* calculus; oxalate of lime; and more lately he added cystic oxide to the list of his previous discoveries. ('Phil. Trans.,' 1810.) In 1804 and 1805 he made known palladium and rhodium, two new metals contained in the ore of platinum, and associated with osmium and iridium, discovered about the same time by Tennant. In 1809 he showed that the supposed new metal columbium was identical with columbium, previously discovered by Hatchett, and shortly before his death he transmitted to the Royal Society the Bakerian lecture, in which he fully describes his ingenious method of rendering platinum malleable." ('Manual of Chemistry,' 6th edition, 1848, vol. i., p. ci.)

In his 'History of Chemistry,' as cited above (vol. ii., p. 243), Dr. Thomson remarks:—"Dr. Wollaston had a particular turn for contriving pieces of apparatus for scientific purposes. His reflective goniometer was a most valuable present to mineralogists, and it is by the means that crystallography has attained to the great degree of perfection which it has recently exhibited. He contrived a very simple apparatus for ascertaining the power of various bodies to reflect light. His camera lucida furnished those who were ignorant of drawing with a most expeditious method of delineating natural objects. His periscopic glasses must have been found useful, for they sold rather extensively; and his sliding rule for chemical equivalents furnished a ready method for calculating the proportions of one substance necessary to decompose a given weight of another. Dr. Wollaston's knowledge was more varied and his taste less exclusive than any other philosopher of his time, except Mr. Cavendish; but optics and chemistry are the two sciences which lie under the greatest obligations to him. To him we owe the first demonstration of the identity of galvanism and common electricity; and the first explanation of the cause of the different phenomena exhibited by galvanic and common electricity."

We may add to the above, that Sir John Herschel has stated that Dr. Wollaston was the first to introduce into instrumental practice, in his goniometer, the direction of a reflected ray of light, as the indication of the angular position of a surface (see also Gelinite handling—a method afterwards proposed by Mr. Babbage and employed by Gauss for other purposes. The use of this instrument by English mineralogists has already been adverted to in the articles Miller, W. H., and Phillips, W. In the hands of the late Professor Armand Lévy also, and those of the late Mr. Henry James Brooke, F.R.S., distinguished for his exact knowledge of minerals, and of his son, Mr. Charles Brooke, F.R.S., it has greatly aided the progress of mineralogy and of the knowledge of crystallised bodies in general.

Huyghens [Huygens, Christian] had applied the undulatory theory of light to the determination of the course of the extraordinary ray in the double refraction of Iceland-spar, a variety of carbonate of lime. This was "a problem," Dr. Pecock has remarked, "of the highest order of difficulty, whose solution, equally remarkable for its simplicitenese and geometrical elegance, was unfortunately left unnoticed or unknown until the beginning of the present century." "We are indebted to Dr. Young" [Young, Thomas], he continues, "for the first suggestion, and to Dr. Wollaston for the first complete demonstration of its value, as giving results which are in strict accordance with the observed laws of double refraction, which Newton had unfortunately mistaken and misstated." Dr. Wollaston's demonstration is contained in his paper 'On the Oblique Refraction of Iceland Crystal,' inserted in the 'Philosophical Transactions' for 1803.

Digitized by Google

Dr. Wollaston's contemporaries in science, and especially those who have eulogised his philosophical character, have had to lament that he never could be induced to describe his manipulations in print, or to communicate to the world his happy and peculiar contrivances. But they were made known to his friends, and have gradually become public property. Nor did he contribute to the literature of science any separate work. His reputation, beyond the circle of his immediate associates, was and will continue to be founded upon his papers in the 'Philosophical Transactions,' 38 in number, which appeared one or more in almost every annual volume from 1797 to 1829, all containing new facts or the soundest theoretical views, enunciated in a style at once explicit and concise, not a single word being ever found to be vacant, redundant, or deficient. His accuracy, whether in experiment or in description, could not of course shield his labours from the common lot of modification and correction by the subsequent progress of science; and this has been chiefly the case perhaps with his minor researches in chemistry, such as those on the blood of diabetic patients, and on the compound of titanium with nitrogen and carbon in certain iron slags, which he (and after him the most eminent chemists of the present day also, down to within these few years) mistook for that metal in an uncombined state. But probably there is no practical philosopher the truth of whose statements and conclusions upon subjects embracing a vast range in nature has been so little impugned.

Without entering further into an account of the various papers by Dr. Wollaston which appear in the 'Philosophical Transactions,' on which much might still be said, did our limits permit, we shall conclude with the following general remarks on his scientific character, by a profound judge of its excellence, the late Dr. William Henry, F.R.S. ('Elements of Chemistry,' 11th edit., vol. i., p. 8):—"Dr. Wollaston," he observes, "was endowed with bodily senses of extraordinary acuteness and accuracy, and with a general vigour of understanding. Trained in the discipline of the exact sciences, he had acquired a powerful command over his attention, and had habituated himself to the most rigid correctness, both of thought and of language. He was sufficiently provided with that resource of the mathematician, to be enabled to pursue, with success, profound inquiries in mechanical and optical philosophy, the results of which enabled him to unfold the causes of phenomena not before understood, and to enrich the arts connected with those sciences by the invention of ingenious and valuable instruments. In chemistry he was distinguished by the extreme nicety and delicacy of his observations, by the quickness and precision with which he marked resemblances and discriminated differences, the sagacity with which he devised experiments and anticipated their results, and the skill with which he executed the analysis of fragments of new substances, often so minute as to be scarcely perceptible by ordinary eyes. He was remarkable too for the caution with which he advanced from facts to general conclusions; a caution which, if it sometimes prevented him from reaching at once to the most sublime truths, yet rendered every step of his ascent a secure station, from which it was easy to rise to higher and more enlarged inductions."

WOLLSTONECRAFT, MARY. [GODWIN, WILLIAM, vol. iii., col. 133.]

WOLSEY, THOMAS, the celebrated cardinal of that name, was born at Ipswich in Suffolk, in 1741. The tale that he was the son of a butcher is probable, though it does not rest upon any sure foundation. It appears that Robert and Joan Wolsey, his parents, were poor but reputable persons, and possessed sufficient means to provide a good education for their son. After having received some preparatory instruction, he was sent to Magdalen College, Oxford, where he graduated at the age of fifteen, gaining by his early advancement the nickname of "the boy bachelor." (Cavendish's 'Life of Wolsey.') He was made fellow of his college, appointed teacher of a school in connection with it, and was ordained. At this school were three sons of the Marquis of Dorset, with whom Wolsey became acquainted, and through whose patronage he enjoyed his first ecclesiastical preferment, the living of Lymington in Somersetshire. He was now twenty-nine years of age, and possessed a winning address, which, combined with great natural ability, and a keen and rapid judgment of character, greatly assisted his promotion. We cannot follow him through every step of his progress, even at the beginning of his career. Though he was not always discreet, it is apparent that he acquired friendships and obtained confidence in each place where he resided. It is said that while he lived at Lymington he got drunk at a neighbouring fair; for some such cause it is certain that Sir Amias Poulet put him into the stocks, a punishment for which he subsequently revenged himself; but the first part of the story is probably a fable. Through his intimacy with a Somersetshire gentleman of some importance, Sir John Nafant, treasurer of Calais, he was named by Sir John his deputy in that office, to which he was personally incapacitated from attending by age and sickness. Nafant's influence at court also procured for Wolsey a nomination as king's chaplain, and introduced him to Henry VII., in whose favour he soon gained a prominent place. Wolsey's insinuating manners and ready ability were not lost upon the king. These were days in which the clergy were barred from no office, ecclesiastical or otherwise. An ambassador was sought to go to Flanders with a message concerning the marriage of the king: despatch was necessary, and the king intrusted the business to Wolsey, who travelled with such rapidity as to return to London before, it is said, his master knew of his departure, and acted in such a manner upon imperfect instructions as to give the king great satisfaction. The credit that he gained by this service contributed to procure him the valuable deanery of Lincoln, to which he was appointed in February 1508. In the following year the king died, and was succeeded by Henry VIII., whose age and character, widely different from his father's, raised a general expectation of an entire change of counsellors and favourites.

Up to this time Wolsey had had no opportunity of playing a great part. He had risen indeed, and risen very rapidly; but he was an obscure person, of low birth, and sufficient time had not elapsed for him to gain any very great eminence. But when the changes to be made at the accession of the new king, it soon became evident that Wolsey's power would be materially increased. Many circumstances favoured his promotion: he was in the prime of life; he was accustomed to the court, for which his manners and address peculiarly fitted him; and he likewise held an important place in the church. The position of public affairs moreover contributed to secure him a place near the person of the king. There were animosities between the Earl of Surrey, the lord-treasurer, and Fox, bishop of Winchester, who held the important offices of privy seal and secretary of state. Fox, de-irous of strengthening his influence, sought to place near the king one of his own friends and adherents. For this purpose he made Wolsey the king's almoner, trusting that his active spirit, his acuteness, and insinuating address would make the favourite of the father the willing master favourite of the son. The adroit courtier did not disappoint his patron: he rose so quickly in the king's good graces that he soon did nearly what he pleased. His religious scruples were not strong enough to lead him to discourage the king's humours and pleasures; on the contrary, he would seem to have promoted his careless gaiety, knowing well that the more time the king employed in its pursuit, the more necessary he would find it to have some active favourite to supply him with the information which he needed, and to proceed with the business which he omitted to transact. Thus, though the king himself never wholly neglected his affairs, the conduct of them chiefly devolved upon the favourite. The success of his general management was soon proved by the gifts that were bestowed upon him. Before the year of the king's accession had passed he had been made lord-almoner, and had been presented with some valuable lands in the parish of St. Bride's, Fleet-street, which Bishop Rotheram had forfeited to the crown. In 1510 he became rector of Torrington; in 1511, canon of Windsor and registrar of the Order of the Garter; in 1512, prebendary of York; in 1513, dean of York and bishop of Tournay in France; in 1514, bishop of Lincoln, and in the same year archbishop of York. In 1515 he was made cardinal, and succeeded Warham as chancellor. In 1516 the pope made him legate à latere, a commission which gave him great wealth and almost unlimited power over the English clergy: he likewise farmed, for the foreign bishops who held it, the rents, the revenues of the diocese of Bath, Worcester, and Hereford, allowing them fixed stipends far below the annual proceeds which were collected; he had also in commendam the abbey of St. Albans; while the enormous revenues that he derived from these sources were further increased by stipends received from the kings of France and Spain and the doge of Venice. Thus Wolsey had accumulated in his own hands the whole power of the state, both civil and ecclesiastical, and derived from foreign and domestic sources an amount of income to which no subject has ever approached: his wealth and influence were almost as enormous as the dignity of the crown. His ambition however was not satisfied; his anxiety for the papacy was avowed; nor did his expectations of gaining it appear extravagant, for at the death of Maximilian (1519) both the kings of France and Spain aspired to the empire, and each, eager to secure the influence of so powerful a minister as Wolsey, promised to assist him in his designs. At the death of Leo X., in 1522, and again in the following year, at the death of Adrian VI., Wolsey sought the vacant throne, but in neither instance was he chosen. "His foreign policy seems to have been biassed by his disappointment, which he attributed to Charles V., whom he ever afterwards held in aversion." We have other instances of the continuance of his resentment and his inability to forgive. He had taken offence at the Duke of Buckingham's conduct towards him: that nobleman's indiscretions afterwards subjected him to an attainder for treason; Wolsey prosecuted the duke with great severity, and though there were hardly sufficient public reasons for such harshness, instigated his execution. An outcry was raised against him for his want of leniency towards this popular favourite: it soon subsided however, for his power made him feared, and his magnificence admired.

Nobody could vie with Wolsey in display: his retinue on the Field of the Cloth of Gold was more numerous and splendid than that of any subject; and during each foreign mission on which he was employed, he was attended with extraordinary pomp. At York Place (now Whitehall) his residence was furnished with every luxury; and he built for himself at Hampton Court a noble palace, of which he eventually made a present to the king. His dress was gorgeous, his manner of living sumptuous, and his household consisted of more than 500 persons; there were among them many people of rank—the Earl of Derby, Lord Henry Percy, and others. He had a "steward" (says his biographer Cavendish, who was his gentleman-usher) "which was

Digitized by Google

always a dean or priest; a treasurer a knight; and a comptroller an esquire; which have always within his house their white staves. . . In his privy kitchen he had a master-cook, who went daily in damask, satin, or velvet, with a chain of gold about his neck." But on the other hand, he promoted learning with consistent liberality: the University of Oxford is indebted to him for its Cardinal's (now Christchurch) College; and for several professorships, which, with the college he founded in his native town of Ipswich, had only a short existence; he likewise encouraged learned persons by patronage and gifts. He was himself no mean scholar, and he is said to have assisted the king, by his intimate knowledge of the works of his favourite author, Thomas Aquinas, and other scholastic writers, when he composed his treatise against Luther. He drew up, in 1528, the Latin rules for his school of Ipswich, which are extant; they are printed in the 'Essay on a System of Classical Instruction' (London, John Taylor, 1825), and contain the course of Latin instruction which Wolsey prescribed for the eight classes into which he divided the school.

The see of Durham, to which he had been recently appointed, Wolsey resigned for that of Winchester. It does not appear that he encouraged any change of doctrine among his clergy; his adherence to the Roman Catholic Church was never shaken. The Reformation indeed made little progress, though many of its seeds were sown in his time. His abuse of ecclesiastical revenues and duties gave convincing evidence of the necessity of change: such rapid translation from dignity to dignity, so large a number of offices held continually in the same hands, while their duties were for the most part neglected, were evils that could not long be tolerated. The exercise of his legatine powers with regard to the examination and suppression of the monasteries, his conduct likewise in the matter of Queen Catherine's divorce, gave strength to the dawning Reformation.

To circumstances connected with the divorce Wolsey's fall is mainly attributable: he advised the king to put away Catherine, but not to marry Anne Boleyn, and thus he offended both the actual queen and the queen elect. An oppressive and illegal taxation had made him unpopular with the multitude; while at court there were powerful enemies labouring continually to undermine the king's confidence in his favourite, whom he had treated with such unlimited confidence, and trusted with such unparalleled authority. The dukes of Norfolk and Suffolk, and Lord Rochford, Anne Boleyn's father, and Anne herself, united in their efforts to overthrow him, and eventually succeeded in their machinations. At the commencement of the Michaelmas term, 1529, two informations were filed against him in the Court of King's Bench, charging him with having, as legate, transgressed the statute of præmunire. Wolsey admitted the charge, "of which he was technically guilty, inasmuch as he had received Bulls from Rome without a formal licence." (Sir J. Mackintosh, 'Hist. Eng.,' vol. ii., p. 166.) "The court pronounced their sentence, that he was out of the protection of the law, that his lands, goods, and chattels were forfeited, and that his person was at the mercy of the king." He was ordered to retire to Esher, a country-house belonging to the see of Winchester, and was so closely shorn of all magnificence as nearly to be wanting in the ordinary comforts of life. Many of his friends deserted him; his followers and dependents showed the most devoted attachment to their master in his distress. He sank into a state of deep dejection. Henry temporarily reinstated him in his following year (1530). Wolsey "was restored to the see of Winchester and the abbey of St. Alban's, with a grant of 6000*l.*, and of all other rents not parcel of the archbishopric of York. Even that great diocese was afterwards restored. He arrived at Cawood Castle about the end of September 1530, where he employed himself in magnificent preparations for his installation on the archiepiscopal throne." His popularity in the north was increased by his hospitality and affability. His enemies at court however were bent upon his ruin, and the king's determination to cast off the once favoured their design, for under these circumstances it was evidently little desirable that a cardinal should fill the principal offices in the state. The Earl of Northumberland received orders to arrest him for treason, and to bring him to London to stand his trial. With what particular act he was charged we are not informed, and with the obsequious servants of the tyrant it little mattered. He proceeded towards London on his mule, but by the way he was attacked with a dysentery. As he entered the gate of the monastery of Leicester, he said, "Father Abbot, I am come to lay my bones among you;" and so the event proved: the monks carried him to his bed, upon which, three days afterwards, he expired Nov. 28, 1530. Shakespere has little altered the words he addressed on his deathbed to Kyngston, the lieutenant of the Tower, though in the play they are given to Cromwell:—"If I had served God as diligently as I have done the king, he would not have given me over in my grey hairs."

Wolsey attained his elevation by a winning address, combined with shrewdness, talent, and learning; his ambition was unlimited, his rapacity great, he was arrogant and overbearing, and extremely fond of splendour and parade. But he was a great minister, enlightened beyond the age in which he lived, diligent in business, and a good servant to the king; for when his authority was established he checked the king's cruelty, restrained many of his caprices, and kept his passions within bounds: the latter part of Henry's reign was very far more cruel and less just than that during which the cardinal presided over his counsels.

WOOD, or À WOOD, ANTHONY, was born in the city of Oxford, December 17, 1632. His father was a gentleman of independent property. Anthony was sent to a private Latin school in 1640, and in 1641 was removed to New College, Oxford, but in 1644, in consequence of the civil disturbances, was sent to a school at Thame. In 1646 his mother placed him under his brother Edward, in Trinity College, Oxford, and he went to him once or twice a day to receive instruction. On the 26th of May 1647, he was matriculated in the University of Oxford as the son of a gentleman, and entered Merton College, October 18, 1647. About 1650 or 1651 he began to learn to play on the violin, at first without instruction, but afterwards under a teacher. He seems to have attained to great skill on the instrument, and was for many years a member of a musical club in Oxford, in which concerted pieces were performed, both vocal and instrumental, by men of some eminence as musicians. Painting was also another of his favourite pursuits, but there seems to be no evidence of his skill in that art. He graduated A.B. in 1652. Heraldry, which also became one of his studies, was perhaps better suited to his antiquarian tastes; his sedulous study in the public library of the University attracted the attention of Dr. Thomas Barlow, the head keeper of the library, who treated Anthony with much kindness, gave him every assistance in his power, and even allowed him to take books and manuscripts to his home.

In December 1655, Wood took the degree of M.A. Dugdale's 'Antiquities of Warwickshire' came out in 1656, and was read by Wood with great delight and admiration. His taste for studies the study of antiquities was confirmed, and he now began to transcribe the monumental inscriptions and arms in the parish churches and college chapels of the city and University of Oxford. After the Restoration he obtained leave from Dr. Wallis, in 1660, to consult the university registers, documents, and other documents in the Schools Tower. This was a valuable fund for him, and here he may be said to have laid the foundation of his 'History and Antiquities of Oxford.' In 1667 Wood went to London with a letter of introduction from Dr Barlow to Sir William Dugdale, by whose influence he obtained leave to view the manuscripts in the Cotton Library and the records in the Tower.

Wood having completed his 'History and Antiquities of Oxford,' the University offered him 100*l.* for the copyright, which he accepted in October 1669, and the payment was made in March 1670. This purchase was made with the intention of having the work translated into Latin for the use of foreigners, which was done under the inspection of Dr. Fell, and the work was published at Oxford in 1674, in 2 vols. folio, with the title of 'Historia et Antiquitates Universitatis Oxoniensis.' Wood complained bitterly of this translation; and Thomas Warton, who may be supposed to be a less prejudiced judge, remarks, "I cannot omit the opportunity of lamenting that Dr. Fell ever proposed a translation of Wood's English work, which would have been infinitely more pleasing in the plain natural dress of its author than in the accurate authority. The translation is allowed to be full of mistakes: it is also stiff and unpleasing, perpetually disgusting to the reader with its affected phraseology."

In 1691 Wood published his 'Athenæ Oxonienses, an exact History of all the writers and bishops who have had their education in the University of Oxford from 1500 to 1695, to which are added the Fasti or Annals of the said University,' London, folio, 2 vols. in one. The work is written in very slovenly English, but it contains a valuable fund of materials, selected with care, though not always with judgment and without prejudice. He was prosecuted before the vice-chancellor's court of the university for some remarks in the 'Athenæ Oxonienses,' on the character of the late Earl of Clarendon, and received a sentence of expulsion. He was also attacked by Bishop Burnet, and replied in a 'Vindication,' &c., 4to, 1693.

Wood died November 29, 1695, aged sixty-five. He was a large and strong man. He retained his faculties to the last, and just before he died gave directions for the burning of a great mass of manuscripts, and left his books and such of his manuscripts as he considered of value to the University of Oxford: they were deposited in the Ashmolean Museum.

In 1721 a second edition, 'corrected, and enlarged with the addition of above 500 new lives from the author's original manuscripts,' was published in London, 2 vols. folio. Philip Bliss published at Oxford 'Wood's Athenæ Oxonienses continued to 1800,' 4to, 2 vols., 1813: to the 3rd volume, published in 1817, was added 'Fasti Oxonienses, or Annals of the said university, with Notes and Additions,' 4to. The Rev. John Gutch, M.A., registrar of the University of Oxford, published in 1786-96, at Oxford, 'The History and Antiquities of the University of Oxford, now first published in English from the original Manuscripts in the Bodleian Library, by Anthony Wood; with a Continuation to the present time, by the Editor,' 3 vols. 4to. The first volume of a new edition of Dr. Bliss's edition of the Athenæ Oxonienses, containing the Life of Wood, was published by the Ecclesiastical History Society in 1843; but no further progress was made in the work, the society having been dissolved, a circumstance much to be regretted, as Dr. Bliss is known to have accumulated a great amount of valuable additional information since the publication of his former edition.

WOOD, JOHN, commonly spoken of as 'Wood of Bath,' was an architect of considerable repute in the time of George II., in ability

Digitized by Google

and taste little if at all inferior to any of his contemporaries, although he has obtained less notice from architectural and biographical writers than some of them have done. In fact very little can now be collected relative to him beyond what he himself has incidentally told us in his 'Description of Bath.' That city is indebted to him for its architectural fame, and he may be considered as having there introduced a style of street architecture till then quite unknown in this country, by combining a number of private houses into one general design.

It was about the end of 1726 that he began his Bath 'improvements,' which he carried on uninterruptedly for about twenty years, within which time he entirely changed the architectural character of the place, and conferred upon it even a degree of magnificence, at least as displayed in such parts as the Parades, the Circus, the Royal Crescent, Queen Square, and some of the public edifices. Of these some of these would have been superior to what they are, had they been executed entirely according to the original designs. What he did at Bath alone would justly entitle Wood to an eminent place in the history of English architecture, and not least of all for the very reason which has perhaps occasioned him to be passed over with mere general notice, inasmuch as he distinguished himself rather as the founder of a system of improvement than as the author of any individual structures of importance. Still he produced some works of the latter class that would have preserved his name from oblivion; among them are the noble mansion of Prior Park, erected for 'the generous Allen,' that of Buckland, for Sir John Throckmorton, and the Exchange at Bristol, first opened in September 1743. This last is, if not a very large, a very handsome structure (110 by 148 feet), and the principal or north front is very tastefully specimen of the Palladian style than almost anything by Palladio himself.

Wood, who at that time was a justice of the peace for Somersetshire, died May 23rd, 1754, but at what age is not said: he was probably born about the close of the preceding century. He was also known as a philosophical writernpon his art by his 'Origin of Building, or the Plagiarism of the Ancients,' fol., 1741, which is however rather strained and fanciful in its opinions, its argument being to show that the system of architectonic beauty and proportion is derived from the Jewish nation. To this publication may be added his 'Essay towards a Description of Bath,' second edition, 2 vols. 8vo, plates, London, 1749; and 'Description of the Exchange of Bristol,' with plates, 8vo, Bath, 1745.

WOOD, ROBERT, sometimes distinguished as 'Palmyra' Wood, an accomplished scholar and archæologist, was born at Riverstown in the county of Meath, Ireland, in 1716. Having finished his studies at Oxford, where he applied himself with extraordinary diligence to classical and more especially Grecian literature, he visited Italy more than once, and in 1742 made a tour as far as the island of Zante, which he set out on but until 1750 that, in conjunction with his friends Bouverie and Dawkins, and with the Italian architect Borra for their draftsman, he set out on his celebrated antiquarian expedition through Asia Minor and Syria. Before reaching Palmyra, Bouverie died of fatigue, that Wood and his remaining companions pursued their researches and labours with success. Almost immediately on his return he published the 'Ruins of Palmyra,' 1753, with 57 plates; and in 1757 the 'Ruins of Balbeck,' 47 plates,—two works constituting an epoch in the study of classical architecture, and which, if afterwards surpassed by Stuart's 'Athens,' had the merit of preceding it by several years.

In 1759, while engaged in preparing for the press his 'Essay on the Genius of Homer,' he was made under-secretary of state by the Earl of Chatham, in consequence of which he suspended his literary studies, and that work was not published till after his death (which happened at Putney, September 9, 1771), when it appeared under the title of 'An Essay on the Original Genius and Writings of Homer; with a Comparative View of the Antient and Present State of the Troad,' 4to, London, 1775. This learned dissertation, which has been translated into French, German, Italian, and Spanish, treats of the personage of Homer, his travels, his system of mythology, and of the geography and ethnography of the 'Iliad' and 'Odyssey.' It is however by his two other works that he is now more generally known, and they are a very important addition to the history and archæology of architecture, affording as they do satisfactory evidence of Roman magnificence in distant regions, and in places whose very existence had come to be nearly regarded as fabulous.

WOODALL, JOHN, an English surgeon, was born about 1556. He was a surgeon in the army during the reign of Queen Elizabeth, and went to France with the troops under Lord Willoughby. On his return he settled in London, and was very active in his attentions to those sick of the plague which prevailed in London in the early part of the reign of James I. There is no record of his having been a surgeon in the navy, but in 1612 he published a work describing the diseases of sailors, under the title of the 'Surgeon's Mate.' In this work there is an excellent account of the fearful disease, as it prevailed at that time, known by the name of scurvy. In the same year that he published this book he was appointed surgeon to St. Bartholomew's Hospital. In 1628 he published a treatise entitled 'Viaticum,' and afterwards a treatise 'On the Plague,' and a work upon 'Gangrene and Sphacelus.' All these works were collected together and published in London, in 1639. These works display sound observation and correct reasoning, and obtained for him an extensive reputation. He had a large practice in London, and was made a master of the Surgeons' Company. There is no account of the time at which he died. In the preface to the works published in 1639, he speaks of himself then as in infirm health.

WOODDESSON, DR. RICHARD, was Vinerian professor in the University of Oxford. He published 'Elements of Jurisprudence, treated of in the preliminary part of a Course of Lectures on the Laws of England,' 4to, London, 1783; 'A Systematical View of the Laws of England, as treated in a Course of Lectures read at Oxford during a series of years,' 3 vols. 8vo, London, 1792; 'Brief Vindication of the Rights of the British Legislature; in answer to some Positions advanced in a pamphlet entitled Thoughts on the English Government,' London, 1769, 8vo pamphlet. Wooddesson died October 29, 1822. The Lectures on the Law of England were edited in 1834, in 2 small volumes, 8vo, by W. R. Williams, D.C.L., who observes in the preface that "these lectures seem to be as superior to the Commentaries (of Blackstone) in accuracy of rules and justness of division and definition, as they are inferior in elegance of style and charm of narrative;" or, to speak in plain terms, the editor means to say that the Lectures are superior to the Commentaries in all matters which constitute the merit of a law book; and he is quite right.

WOODFALL, WILLIAM, was the son of the printer of the 'Public Advertiser' newspaper: another son, we believe the elder of the two, was Henry Sampson Woodfall, who succeeded his father in the management of the paper, and held it when it became the medium through which the letters of Junius were given to the world. William was born in 1745 or 1746, and began life by being sent to learn the printing business under Mr. Baldwin, of Paternoster-row. He was then employed for some time in assisting in the printing and editing the 'Advertiser,' till a taste for theatrical amusements, it is related, took such possession of him, that he broke away with a company of players on an excursion to Scotland to gratify that passion. While in Scotland he married, but returned to London about 1772, when he was first employed for a short time as editor of a newspaper called 'The London Packet,' and then undertook the direction, both as editor and printer, of 'The Morning Chronicle.' With that paper he remained connected till 1789, when he left it and set up one of his own, which he called 'The Diary.' Before this, in 1785, he published in an 8vo pamphlet a 'Sketch of the Debate in the House of Commons in Ireland upon the rejection of the twenty commercial propositions;' but it was in 'The Diary' that he first gave proof of his wonderful talent for reporting, by presenting his readers with as detailed accounts of the parliamentary debates on the day after each took place, as the other papers had been in the habit of supplying after an interval of many days; for the practice then was to give only the shortest summary at the time, and to reserve the full speeches till the reports of them could be prepared at leisure. Woodfall's mode of preparing was what would now be thought very extraordinary. "Without taking a note to assist his memory," says the notice of him in the obituary of the 'Annual Register,' "without the use of an amanuensis to ease his labour, he has been known to write sixteen columns, after having sat in a crowded gallery for many hours, without an interval of rest." This exertion however, it is added, in which he took pride, and which brought him more praise than profit, "wore down his constitution, which was naturally good; and when other papers, by the division of labour, protracted the same length of debate, with an earlier publication, he yielded the contest, and suffered his 'Diary' to expire." In his latter years he offered himself a candidate for the office of City Remembrancer, but it was given to another. To the last he continued constantly to attend the debates: he was in the House of Lords four or five days before his death, on the 1st of August 1803. He left a large family, of whom at least one son, Henry, acquired some literary reputation; and a daughter, Sophia, who married Mr. M'Gibbon, became an actress, and also wrote several novels.

WOODHOUSE, ROBERT. There is almost a total silence concerning Professor Woodhouse in the ordinary depositories of biographical information; for the facts of his private life, as here given, we have been indebted to the courtesy of his brothers, Dr. J. T. Woodhouse, Senior Fellow of Caius College, Cambridge, and Richard Woodhouse, Esq., formerly attached to the Supreme Court at Bombay.

Robert Woodhouse was born at Norwich, April 28, 1773. His father was in business in that city, where he was possessed of some freehold estates. He was of a family of some antiquity, and claimed and sought to recover an estate at Beesthorpe, in the possession of Lord Byron (the uncle of the poet). His mother was the daughter of the Rev. J. Alderson of Lowestoft, who was the grandfather of Baron Alderson and Mrs. Amelia Opie. He was educated at North Walsham public school, where he showed no particular desire for the studies in which he afterwards became eminent. He must have commenced residence at Caius College, Cambridge, in 1791, and he took his first degree, and was senior wrangler and first Smith's prizeman, in 1795. He gained a fellowship in his college (in which the fellows, or most of them, may continue laymen), and the concerns of the college and university, with his studies, private pupils, and writings, occupied his life. In 1820 he was elected to succeed Dr. Milner as Lucasian professor of mathematics; and in 1822 he was removed to the Plumian professorship of astronomy and experimental philosophy, vacant by the death of Mr. Vince. In 1823 he married Harriet, the sister of William Wilkins, R.A., the architect, whom he survived. In 1824, when the

Observatory was completed at Cambridge, he was appointed its superintendent; but by this time his health had failed, and he was hardly equal to the extent of his duties. He died in London, December 23, 1827, and was buried in the chapel at Caius College.

Woodhouse is distinguished as the first who, in his university, cultivated the methods of analysis which the genius of the Continental mathematicians had made far superior to that which Newton had left, which last was exclusively studied in England at the time when he graduated. He was the first who introduced this analysis into a work written (or at least published) for the English student, and he must therefore be considered as the leader of the movement by which the mathematicians of this country assimilated their methods to those of their Continental brethren. For this position he had peculiar qualifications: a profound and extensive knowledge of and interest in the progress of all that he attempted to introduce; severe habits of logic, such as are frequently wanting in the modern mathematician; a perfect absence of discipleship; ability to see that much of his imperfect ation was an inferior in accuracy as it was superior in power; and thought and talent to suggest the means of amendment. To these we must add a high private character, and the esteem of his contemporaries—things of the utmost consequence to a literary reformer. His style of writing is peculiarly his own, frequently difficult and perplexed in appearance, but always containing those little additions and collateral explanations which many writers omit, to the detriment of the reader. It would almost seem as if the hints just alluded to had been stuck in after the sentences were written. With those who would rather be stopped for a minute by a writer's construction than for an hour by want of materials to make out a meaning, Woodhouse is a favourite writer; still more so with those who like to think about the first principles of their subject. But to those others who parse instead of comprehending, and think they have made out an author as soon as they see how his sentence runs, he is repulsive; and still more so to those who are rather bent upon using mathematical symbols than understanding them.

We do not mention his papers in the 'Philosophical Transactions,' as their principal points are repeated in his separate writings, which are as follows:—

1. 'The Principles of Analytical Calculation,' 4to, Cambridge, 1803. In this work, which is rather of the descriptive and controversial, than of the elementary character, Woodhouse called the attention of his university to the language and first principles of the Continental analysts, with strong recommendations of the former, and a searching criticism on the latter. He passes under review the methods of infinitesimals, limits, expansions, &c., exposes the total insufficiency of the method of Lagrange, and gives his own views of the mode of establishing the differential calculus. He had evidently, as often happens to those who strictly investigate received systems of reasoning, if not an absolute scepticism as to the possibility of any rigour at the outset, at least an instinctive habit of objection. Though differing from several of his positive conclusions, particularly those which he comes to on the character of the theory of limits, he must always admire the sound thought and clear exposition which distinguish the work throughout. Considering the time and place at which it was published, it is a rare instance of felicity in the choice of a subject and of the manner of treating it.

Among the other qualifications of a controversialist, Woodhouse had a power of sarcasm, which, though in private life, it only went the length of what is called "dry humour," yet appeared now and then in his writings in a manner which would have made an opponent careful what he advanced.

2. 'Elements of Trigonometry,' 8vo, Cambridge, 1809 (several subsequent editions). Of this work Dr. Peacock says that "it more than any other contributed to revolutionise the mathematical studies of this country. It was a work, independently of its singularly opportune appearance, of great merit, and such as is not likely, notwithstanding the crowd of similar publications in the present day, to be speedily superseded in the business of education; . . . and, like all other works of this author, it is written in a manner well calculated to fix strongly the attention of the student, and to make him reflect attentively upon the particular processes which are followed, and upon the reasons for their adoption." The 'Analytical Calculations' was an appeal to the teacher, but the 'Trigonometry' was addressed to the student. It excited the opposition of those who were attached to the old system, and paved the way for the subsequent introduction of the differential calculus, the work on which must have been accompanied by treatises on trigonometry adapted to themselves, if Woodhouse had not supplied the want.

3. 'A Treatise on Isoperimetrical Problems, and the Calculus of Variations,' 8vo, Cambridge, 1810. There is something peculiar to himself in every work which Woodhouse produced. The mode of writing scientific history, which Delambre afterwards adopted, is here seen for the first time: it consists in taking up the subject in such a manner that its history in the hands of each individual is separate from the rest; accordingly we have both the history of the subject and of each of its promoters in his connection with it. Woodhouse puts distinctly before the reader the very problems, methods, and notation of the several writers on the calculus of variations, from the earliest isolated problems of the Bernoullis, to the connected and comparatively finished methods of Lagrange. This book will not pass away like an elementary work; it is a history.

4. 'A Treatise on Astronomy,' 8vo, Cambridge, 1812. This was always intended as a first volume, and the second, published in 1818, is on the theory of gravitation, which is somewhat improperly called 'Physical Astronomy.' But in the subsequent editions the first volume was enlarged into two, which were obliged to be called *parts*; so that we now have vol. I., parts 1 and 2, on astronomy, and vol. II. on physical astronomy, or the theory of gravitation. Of the latter it is only necessary to say, that it was the first work in which the student was introduced to what had been done abroad since the death of Newton, and that it does not retain its place only because the subject has since advanced both abroad and at home. But the first volume still remains perhaps the most remarkable work on astronomy of its century. This distinction it owes to the manner in which Woodhouse makes the reader feel that he is in the very observatory itself. The methods are as perfect as if they had been directions to a computer, a quality which writers who have to explain those methods mathematically frequently do not give them; the examples seem as if they were real ones, as if some astronomer had had to put down the actual figures, and the very observations which are cited are made to smell of the instruments which gave them. Many theoretical works on astronomy may make a reader think he would like the practical part of the science, in which he may afterwards find himself mistaken: but Woodhouse's treatise cannot deceive him in this respect; he will or will not relish practical astronomy according as he is or is not pleased with Woodhouse's book. At least no preceding is more near the truth of this book than of any other. The reason was, that the author was an expert practical astronomer, as well as an original thinker on first principles, who was able to change places with the student in an unusual degree. He was very fond of the subject of practical astronomy, a taste which is not always found in the mathematician, and rarely indeed in one of a speculative turn. Had the observatory been built before the failure of his health, he would probably have become as distinguished in the promotion of astronomy as he was in its explanation: as it was, he had only time to discover the injurious effect of the diagonal braces of the transit instrument.

The character which must be given of the several writings of Woodhouse entitles us to suppose that the revolution in our mathematical studies, of which he was the first promoter, would not have been brought about so easily if its earliest advocacy had fallen into less judicious hands. For instance, had he not, when he first called attention to the continental analysis, exposed the unsoundness of some of the usual methods in establishing it more like an opponent than a partisan, those who were adverse from the change would probably have made a successful stand against the whole upon the ground which, as it was, Woodhouse had already made his own. From the nature of his subjects, his reputation can never equal that of the first seer of a comet with the world at large: but the few who can appreciate what he did will always regard him as one of the most philosophical thinkers and useful guides of his time.

WOODHOUSELEE, LORD. [TYTLER, A. F.]

WOODVILLE, WILLIAM, was born at Cockermouth in 1752. He served an apprenticeship to an apothecary, and afterwards studied medicine at Edinburgh, where he graduated in 1775. After studying some time in the medical schools of the Continent, he returned to Cockermouth, where he commenced the practice of his profession. He continued there five or six years, and then removed to London. Here he was appointed physician to the Middlesex Dispensary, and in 1792 he was elected Physician to the Small-Pox Hospital. Having paid considerable attention to the plants yielding medicines, he published in 1790 a large work, in four quarto volumes, entitled 'Medical Botany,' which consisted of a series of plates representing medical plants, and containing an account of their natural history and uses. This work is imperfect both in the drawings and descriptions of plants, but it was a valuable work at the time it was published, and has led to the production of better works on the same subject. In 1796 Woodville commenced the publication of a work entitled a 'History of the Small-Pox in Great Britain.' This work was never completed, on account of the introduction of vaccination about this time by Jenner. Dr. Woodville had good opportunities of investigating the claims of Jenner's discovery to confidence, and came at first to a conclusion unfavourable to vaccination. He however continued to make observations, and before his death became a strenuous advocate for the introduction of vaccination. He died March 26, 1805.

WOODWARD, JOHN, the author of 'A Natural History of the Earth,' and the founder of the professorship of geology at Cambridge, was born in Derbyshire in 1665. He studied comparative anatomy and natural history at the seat of Sir Ralph Sheldon in Gloucestershire, under the direction of Dr. Barwick, and received his degree of M.D. from Archbishop Tenison. Woodward's attention to fossils was first excited by the shelly limestones of Gloucestershire, from which he conceived the notions of the successive deposition of strata which he afterwards applied to the explanation of the structure of the earth. Previous to 1695 he had, by travelling over the greatest part of England, made himself acquainted with the "present condition of the earth and all bodies contained in it;" collected the "plants, insects, sea, river, and land-shells;" examined the "water of mines, grottoes,"

Digitized by Google

&c.; "for the purpose of getting as complete and satisfactory information of the whole mineral kingdom as he could possibly obtain." In all natural and artificial exposures of the rocks he noted in a journal everything memorable in each pit, quarry, or mine. Unable to travel in Europe amidst the commotions then prevalent, he drew up a series of queries, and transmitted them to intelligent foreigners, who might give him some insight into the structure of the earth as it appeared in foreign regions. The result of all these inquiries was, that "the circumstances of these things were much the same in those countries as in England;" and Woodward proceeded to combine his observations into 'A Natural History of the Earth.' This work, which appeared in 1695 (dedicated to Sir Robert Southwell, president of the Royal Society), has had a remarkable and permanent influence on the progress of English geology. It establishes great truths, linked with great errors. It refutes the notion of the earlier writers, such as Plot, who believed that the fishes, shells, and corals found in the rocks were "mere mineral substances," never connected with or dependent on the functions of life, but formed, like "selenites, marcasites, and flints," by a plastic force in the earth; proves them to be the exuvim of animals; and appeals to them as ancient inhabitants of the sea, yielding evidence of great revolutions in the condition of the globe.

Woodward's conception of these great truths is clear. His inferences concerning the nature and proximate causes of the phenomena which he had examined are clouded by fundamental errors; for instead of the philosophical opinion of antiquity revived by Steno, that the dry land in which the marine exuvim were found had formerly been the bed of the sea, and had been raised out of it by convulsions, or left by retirement of the waters, Woodward maintained that these marine bodies "were borne forth of the sea by the universal deluge; that during the time of the deluge all the stone and merble of the antediluvian earth, all the metals of it, all mineral concretions, and, in a word, all fossils whatever that had any solidity, were totally dissolved into one confused mass; the parts of this mass subsided according to the laws of gravity, the heaviest descending first, and inclosing the heavier sorts of shells (as cockles, &c.); the lighter (as chalk) falling afterwards, and inclosing lighter shells (as echini); while human bodies, bodies of quadrupeds, birds, &c., teeth and horns, &c., shells of land-snails, &c., being, bulk for bulk, lighter than sand, marl, chalk, &c., were not precipitated till the last, and so lay above all the former, constituting the supreme or outmost stratum of the globe." Woodward further maintained that the strata were originally horizontal, and that the actual irregularities of their position were due to convulsions whose cause was ascribed to fire; and in his pages appear many other curious glimpses of important truths, obscured by the general fault of his system, the reference of *all* the phenomena which he observed to one universal deluge.

The work received and deserved applause, but met with immediate opposition on good philosophical principles by J. A., M.D. (Dr. Arbuthnot), 1697. The author however remained unconvinced, and published in 1724 a defence of his system against the objections of Camerarius of Tubingen ('Naturalis Historia Telluris Illustrata et aucta'). To this work Woodward appended a 'Description of Earths, Bituminous Substances, Minerals, and Metals ('Methodica Fossilium in Classes Distributio,' dedicated to Sir Isaac Newton, Pres. R.S.). In 1728, after his death, appeared an enlargement of this method, accompanied by interesting letters to Newton, Hoskyns, &c., and directions for observers and collectors. A greater and more valuable work, in two volumes, published from Woodward's manuscript in 1728 and 1729 ('Attempt towards a Natural History of the Fossils of England'), closes the list of the geological publications of Woodward. The first volume of this catalogue contains notices of above "fifteen hundred bodyes" in the first part, and a catalogue of English extraneous fossils in the second part. These specimens were bequeathed to the University of Cambridge, and are still preserved therein, according to the directions of the will, by the professors on Woodward's foundation. In the second volume are described additional English and some foreign specimens, which were ordered to be sold.

Dr. Woodward appears to have been diligent and accurate in gathering information, and tolerably versed in the philosophy and science of his day, but his hypotheses are little in harmony with chemistry or mechanics, and sometimes opposed to the most obvious and ordinary facts. The sincerity and zeal with which he prosecuted geology are evinced by the noble bequest of his collections, and a fund for endowing a professorship, to the University of Cambridge; a bequest which has given the opportunity for Mitchell and Sedgwick to add to the renown of the University, and to link the name of Woodward with some of the highest and most generalisations in geological science.

In 1707 he published 'An Account of Roman Urns and other Antiquities lately dug up near Bishopsgate,' addressed to Sir Christopher Wren, and in other respects he distinguished himself as a collector of antiquities. His professional career appears to have been prosperous. He was elected Fellow of the Royal Society and of the College of Physicians, and was appointed professor of physic in Gresham College. He engaged in controversy with Mead and Friend on the subject of small-pox. He died April 25, 1728.

WOOLHOUSE, JOHN THOMAS, an English surgeon who devoted himself principally to the treatment of diseases of the eye. For this purpose he travelled throughout Europe, and became known to the principal men of science of his day. He wrote many works on the eye and its diseases. They are all written in French, and were published in Paris, although he does not appear to have resided in France. His best works are his 'Catalogue d'Instrumens pour les Opérations des Yeux,' published in 8vo at Paris in 1696, and his 'Expériences des différentes Opérations manuelles et Médicinales qu'il a practiquées aux Yeux.' This last book, which contains a good account of the various operations performed at the time it was written, was published at Paris, in 1711. His books are written in an inflated style, and were evidently intended to advance his views in the practice of his art. He wrote against Heister on the seat of cataract, in which he contended that it was not in the crystalline lens. There is at present in the library of the College of Surgeons, London, a manuscript work by Woolhouse, entitled 'Traité des Maladies de l'Œil,' in two volumes quarto. This work is more complete than his other works, but was never published. He died in 1730.

(*Biog. Med.*; Woolhouse, *Works*, at College of Surgeons.)

WOOLLETT, WILLIAM. This excellent engraver was born at Maidstone in Kent, in 1735. He learned his art of John Tinney, an obscure engraver in London, but he soon adopted a style of his own, acquired early a great reputation as a landscape engraver, and was appointed engraver to George III. No artist ever used together more effectively the etching needle and the graver: in foliage, water, and in rocks, Woollett was particularly successful, and it still excelled; but in figures, and especially in flesh, he was less so. In the latter part of his life Woollett took to historical engraving; and also in this department he has produced some of the finest plates of which the English school of engraving can boast: the 'Death of General Wolfe,' and the 'Battle of the Hogue,' both after West, are considered his best historical pieces, and they are certainly plates of remarkable merit. Of his landscapes his masterpieces are those which he engraved after Wilson: they are nine in number, namely, 'Phaeton,' 'Niobe,' 'Hadon and Amelia,' 'Cyzx and Alcyone,' 'Snowdon,' 'Cicero at his Villa,' 'Meleager and Atalanta,' 'Apollo and the Pythons,' and 'Solitude,' a companion-piece to 'Cicero at his Villa.' In the last plate he was assisted by Ellis, and in the Meleager and in the Apollo by Pouncey. He engraved also after Claude, Zuccarelli, the Smiths of Chichester, Cooper, Stubbs, and others, and he executed plates after views drawn from nature by himself. Woollett died May 23rd, 1785, aged fifty, and was buried in old St. Pancras churchyard: there is a monument to him in the cloisters of Westminster Abbey. He is spoken of as a man of admirable character, a very amiable disposition, and as being utterly regardless of money. It is thought that he could by any additional amount of work improve a plate.

WOOLSTON, THOMAS, was born in 1669, at Northampton, and was the son of a respectable tradesman of that city. He went from a grammar-school to Sidney Sussex College, Cambridge, where, after the usual time, he took degrees of Bachelor of Arts and Master of Arts, was elected a fellow of his college, and continued to reside as such. He entered into holy orders, and in due time took the degree of Bachelor of Divinity. In 1705 he published his first work, entitled 'The Old Apology for the Truth for the Christian Religion against Jews and Gentiles revived.' No publication again proceeded from him till after an interval of fifteen years spent in laborious study of the works of the fathers within the walls of his college; and in 1720 he published three Latin tracts, one of which, entitled 'De Pontii Pilati ad Tiberium Epistola circa Res Jesu Christi gestas, nuper Mytographum,' was an endeavour to prove that the letter of Pontius Pilate which had been transmitted by the fathers was a forgery, without denying that a letter had been written to Tiberius; and the two others were letters written, under the title of 'Origen Adamantius Renatus,' to Dr. Bennet, Whitby, Waterland, and Wilkins, on the interpretation of the Scriptures. About the same time he published two tracts, in the form of letters to Dr. Bennet, and under the name of Aristobulus, one on the question 'Whether the Quakers do not the nearest of any other sect of religion resemble the Primitive Christians in principles and practices?' and the other being 'A Defence of the Apostles and Primitive Fathers of the Church in their Allegorical Interpretation of the Law of Moses, against the Ministers of the Letter and Literal Commentators of this age;' and he immediately followed up these publications by writing an answer to them. The letters to Dr. Bennet, and the answer to the letters, abounded in attacks upon the clergy, which, together with the spirit of allegorical interpretation of the Scriptures pervading as well the letter of the two letters, as his previous letters to Doctors Whitby, Waterland, and Whiston, exposed Woolston to much suspicion and attack from the side of his last publication, in 1722, was one not calculated to give offence, being a tract entitled 'The exact Fitness of the Time in which Christ was manifested in the Flesh, demonstrated by Reason, against the Objections of the Old Gentiles and of Modern Unbelievers,' which had been written twenty years before, and read in Sidney Sussex College chapel. In 1723 and 1724 he published four pamphlets, under the title of 'Free Gifts to the Clergy,' and then an answer to them, all directed against the clergy. In 1726 he entered into the controversy raised by Anthony Collins's 'Grounds and Reasons of the Christian Religion,' by the publication of a work to which he gave the name of 'Moderator between an Infidel and Apostate,' and two 'Supplements to Moderator.' The lengths to which he carried his allegorical interpretation

of the Scriptures in these last publications, denying the reality of the miracles wrought by Christ, brought upon him a prosecution by the attorney-general. This prosecution was stopped at the intercession of Mr. Whiston. Nothing daunted, he proceeded in proclaiming his views as to the allegorical character of the miracles, in 'Six Discourses on the Miracles of Christ,' which were addressed to six bishops—Gibson, bishop of London; Chandler, bishop of Lichfield; Smalbroke, bishop of St. David's; Hare, bishop of Chichester; Sherlock, bishop of Bangor; and Potter, bishop of Oxford. In these discourses much irony against the bishops whom he addressed, and against the clergy in general, was mixed with the heterodox doctrine which they were written to support; and the tone of ridicule and banter in which the miracles were treated of aggravated the offence given. Woolston was again made the object of a prosecution, and having defended himself on his trial, was sentenced by the court of King's Bench to a year's imprisonment and a fine of 100*l.* At the expiration of the year, being unable to pay the fine, he continued in confinement. Attempts were made by some of his friends to procure his release; but Woolston would not consent to give security not to offend again by similar writings. By the assistance of a brother, an alderman of Northampton, he was enabled to purchase the liberty of the rules of the King's Bench, and was partly supported by him during the short remainder of his life. He had lost his fellowship at Cambridge some years before by non-residence. He died on the 27th of January 1733, after a very short illness. He was buried in St. George's Churchyard, Southwark.

WORDSWORTH, REV. CHISTOPHER, D.D., was born June 9, 1774, at Cockermouth, Cumberland. He was the youngest son of John Wordsworth, and the younger brother of William Wordsworth the poet. He was educated at Hawkshead grammar-school, and at Trinity College, Cambridge, where he went in 1792, and took his degree of B.A. in 1796. He was elected Fellow of Trinity College, October 1, 1798, and in 1799 took his degree of M.A. In 1803 he published 'Six Letters to Granville Sharp, Esq., respecting his Remarks on the Uses of the Definitive Article in the Greek Text of the New Testament,' 8vo, a volume which was praised by Bishop Horsley and Bishop Middleton, and procured him the patronage of Dr. Manners Sutton, Archbishop of Canterbury, who appointed him his domestic chaplain. He married October 6, 1804, Priscilla, daughter of Charles Lloyd, Esq., banker, of Birmingham, and in the same year was preferred to the rectory of Ashby and Obey-with-Thirne in Norfolk, whence he was promoted to the deanery of Bocking, in Essex, May 30, 1808. In 1809 appeared the first edition of his 'Ecclesiastical Biography, or the Lives of Eminent Men connected with the History of Religion in England,' 6 vols. 8vo, which was reprinted in 1818, and again in 1839, with additions, in 4 vols. 8vo. He received by royal mandate the degree of D.D. in 1817, and in the next year Dr. Wordsworth published his 'Reasons for declining to become a Subscriber to the British and Foreign Bible Society,' a 'Letter to Lord Teignmouth,' in vindication of his 'Reasons,' and a 'Second Letter to Lord Teignmouth.' In 1814 he published 'Sermons on various Occasions,' 2 vols. 8vo. He was collated to St. Mary's, in Lambeth, Surrey, and of Sundridge in Kent, April 10, 1816. Soon afterwards he served as chaplain to the House of Commons. On the 26th of July 1820, he was installed Master of Trinity College, Cambridge, in the same year he exchanged the livings of Lambeth and Sundridge for the rectory of Buxted, with Uckfield, in Sussex. In 1824 and 1828 he produced two elaborate volumes on the authorship of 'Ἐικὼν Βασιλική,' which he unhesitatingly ascribed to Charles I. The first volume is entitled 'Who wrote *Ikon Basilike*, considered and answered,' 8vo; the second, 'King Charles the First the Author of *Ikon Basilike* further proved, in a Letter to his Grace the Archbishop of Canterbury, in Reply to the Objections of Dr. Lingard, Mr. Todd, Mr. Broughton, the Edinburgh Review, and Mr. Hallam,' 8vo. Dr. Wordsworth's last important literary work was his 'Christian Institutes,' 4 vols. 8vo, 1837, designed specially for the use of students in the university and candidates for holy orders. He resigned the Mastership of Trinity College in 1841, and was succeeded by the late Master, Dr. Whewell. From that time he resided at Buxted, where he died February 2, 1846. He was buried in Buxted Churchyard. He had three sons. 1, Rev. John Wordsworth, born July 1, 1805, was Fellow of Trinity College, Cambridge, and died there December 31, 1839. 2, Rt. Rev. Charles Wordsworth, M.A. and D.C.L., graduated at Christchurch, Oxford, was second master of Winchester College, and is now (1857) Bishop of the United Diocese of St. Andrews, Dunkeld, and Dunblane, Scotland, to which he was consecrated in 1853. 3, Rev. Christopher Wordsworth, the subject of the following notice.

'WORDSWORTH, REV. CHRISTOPHER, D.D., was born about 1807, and is the youngest of the three sons of the late Dr. Christopher Wordsworth. He studied at Trinity College, Cambridge, where, in 1827 he wrote the 'Druids,' a poem, which obtained the chancellor's medal; in 1828 he received the Browne's medals for the best Latin ode and Greek epigram, and was again a chancellor's medallist in 1830, in which year he took his degree of B.A. In 1832-33 he travelled in Greece. Having graduated M.A. and taken holy orders, he was elected a Fellow of Trinity College, Cambridge, and in 1836 public orator in the university. In 1835 he became head-master of Harrow School, a situation which he retained till November 1844, when he was appointed a canon and in 1855 archdeacon of Westminster. In 1850 he was preferred to the vicarage of Stanford-in-the-Vale, Berkshire.

Dr. Wordsworth's literary works are numerous. The following list comprises the most important of them, with the dates in which they were successively published. 'Athens and Attica, Journal of a Residence there,' 8vo, 1836. 'Ancient Writings copied from the Walls of the City of Pompeii, with Fac-Similes,' 8vo, 1838. 'Greece, Pictorial, Descriptive, and Historical,' roy. 8vo. 'Sermons preached at Harrow School,' 8vo, 1841. 'The Correspondence of Richard Bentley, D.D., Master of Trinity College, Cambridge, with Notes and Illustrations,' 2 vols. 8vo, 1842. 'Theophilus Anglicanus, or Instruction for the Young Student concerning the Church, and our own Branch of it,' 8vo, 1843. 'Prælectiones Selectæ; Prayers for Harrow School,' 12mo, 1843. 'Theocritus, Codicum MSS. ope recensitus et emendatus, cum Indicibus Locupletissimis,' 8vo, 1844. 'Diary in France, mainly on Topics concerning Education and the Church,' 8vo, 1845. 'Letters to M. Gondon, author of "Mouvement Religieux en Angleterre," &c., on the Destructive Character of the Church of Rome both in Religion and Policy,' 8vo, 1847. 'Sequel to Letters to M. Gondon,' 8vo, 1848. 'On the Canon of the Scriptures of the Old and New Testament, and on the Apocrypha, Eleven Discourses preached before the University of Cambridge, being the Hulsean Lectures for the year 1847,' 8vo, 1848. The second edition in 1851, with an additional lecture, is entitled 'On the Inspiration of the Holy Scriptures, or, on the Canon,' &c. 'Lectures on the Apocalypse, Critical, Explanatory, and Practical, delivered before the University of Cambridge, being the Hulsean Lectures for the year 1848,' 8vo, 1849. 'Elementary Instruction concerning the Church and the Anglican Branch of it, for the Use of Young Persons,' 12mo, 1849. This is the 'Theophilus Anglicanus,' in an abridged form. 'Occasional Sermons preached in Westminster Abbey,' 2 vols. 8vo, 1850, &c. 'Memoirs of William Wordsworth, Poet-Laureate, D.C.L.,' 2 vols. 8vo, 1851. 'St. Hippolytus and the Church of Rome in the earlier Part of the Third Century (from the newly-discovered Philosophumena),' 8vo, 1853. 'Remarks on M. Bunsen's Work on St. Hippolytus, particularly on the Preface to his new Edition,' 8vo, 1855. 'Babylon, or the Question examined, Is the Church of Rome the Babylon of the Apocalypse,' 12mo, 1856.

WORDSWORTH, WILLIAM, was born at Cockermouth, Cumberland, on the 7th of April 1770, the second son of John Wordsworth, attorney-at-law, and law-agent to Sir James Lowther, afterwards Earl of Lonsdale, by Anne, only daughter of William Cookson, a mercer at Penrith. The Wordsworths were originally from Penistone in Yorkshire, where they had been settled from the Norman Conquest; and the name of Wordsworth's maternal grandmother was Crackanthorpe, of the Crackanthorpes of Westmoreland. The poet was therefore by origin a thorough Northern England man. He had three brothers—Richard, who was two years his senior, and who became a London attorney, and died in 1816; John, who was nearly three years his junior, and who became commander in the navy, and perished by shipwreck off Weymouth in 1805; and Christopher, the youngest, noticed above. [WORDSWORTH, CHRISTOPHER, D.D.] "I read," he says, "all Fielding's works, 'Don Quixote,' 'Gil Blas,' and any part of Swift that I liked; 'Gulliver's Travels' and the 'Tale of a Tub' being both much to my taste." Here also he first began to write verses, as schoolexercises, and to store his memory with observations of English rural nature. He became a fair Latin scholar, and was taught something of mathematics; but, upon the whole, the acquisitions possible at the school were not great. On the death of Wordsworth's father, which occurred while he was still at school, it was found that the principal part of his property consisted of a debt of 5000*l.* owing to his estate by Lord Lonsdale; a considerable part of what there was besides was expended in a lawsuit with a view to recover this; but enough remained, when scraped together, to complete the education of the children, under the guardianship of two uncles. By them Wordsworth was sent, in October 1787, to St. John's College, Cambridge, of which college he continued a student till January 1791, when he quitted Cambridge altogether, having taken his B.A. degree. His recollections of his *Alma Mater* were by no means affectionate or reverential. He says—

> "I did not love,
> Judging not ill perhaps, the timid course
> Of our scholastic studies; could have wished
> To see the river flow with ampler range
> And freer pace"—

and, in particular, he was repelled by the mechanical manner in which religious forms and exercises were gone through. "Intellectually," says his nephew and biographer, "he and the university were not in

Digitized by Google

full sympathy with each other. He had never been subject to restraint; his schooldays were days of freedom; and latterly, since the death of his parents, he was almost entirely his own master. In addition to this, his natural temperament was eager, impetuous, and impatient of control." At college, however, he read and thought much; he studied Italian; and he began to feel himself a poet. He employed the vacations in tours, to gratify his passion for the open air and for scenes of natural beauty and grandeur; and one of these tours, made in the autumn of 1790, with a fellow-collegian, was a pedestrian one through France and Switzerland, at the very time when the French Revolution was in its full tide of progress. In 1791, after taking his degree, he spent some time in London, and made a pedestrian tour in North Wales; and in the autumn of that year he went over to France, where he spent fifteen months in all, partly in Paris, partly in Orleans, and partly in Blois. "It was," he says, "a stirring time. The king was dethroned when I was at Blois; and the massacres of September took place when I was at Orleans." Wordsworth was no mere indifferent spectator of the scenes of the Revolution. At this time of his life he was a vehement republican, and an ardent partisan of revolutionary France against all the rest of the world. He had friends too among the revolutionists of the Girondist party, and so fully did he share their enthusiasm that he even entertained the intention of becoming a naturalised Frenchman, and throwing himself, heart and soul, into the struggle for liberty—believing that what it chiefly wanted to ensure a glorious success was the activity of a few steady, virtuous, and resolute minds, such as he was conscious of possessing. Of this he was still more convinced after Robespierre began to exercise his power. Had he carried out his intention, the probability, as he himself says, is that he would have been one of Robespierre's victims, and have died on the scaffold with some of his Girondist friends. Circumstances however fortunately obliged him to return to England towards the end of 1792, a little before the execution of the king. He took up his abode for the time in London; but his thoughts were still on the other side of the Channel, and he followed the further course of the Revolution with intense interest, complicated by the feeling that Britain, in declaring war against France, had engaged in an unjust enterprise. Much of the influence of this time, though greatly modified, remained with Wordsworth throughout his life.

From 1792 to 1795, Wordsworth lived in a desultory manner in London and other parts of England. He had been destined for the church, and his friends were much disappointed at his preferring what seemed to them an idle and aimless life. His religious, as well as his political, principles, at this time were not of a kind conformable to the society into which he moved. Adhering to republican politics, was his passion; and he had already conceived the possibility of a new kind of descriptive poetry, which should do justice to "the infinite variety of natural appearances that had been unnoticed by the poets of any age or country." In the year 1793 he published his first literary venture, two poems of little merit in the heroic couplet—"An Evening Walk, addressed to a Young Lady,' and 'Descriptive Sketches, taken during a pedestrian tour among the Alps.' It was the time of the rise of a new poetical spirit in England, Bowles and Crabbe having just appeared in the field after Cowper, and the Scottish poet Burns being then in the full flush of his fame. New poets were also springing up; and one of these, Coleridge, thus describes the impression made on him by the volume which Wordsworth had published: "During the last year of my residence at Cambridge, I became acquainted with Mr. Wordsworth's first publication; and seldom, if ever, was the emergence of an original poetical genius above the literary horizon more evidently announced." The volume did not however attract general attention; and for a while, Wordsworth's prospects were very uncertain. Having no independent means of livelihood, he contemplated entering the legal profession and even obtaining himself meanwhile as a political writer on the liberal side for the London newspapers. From this situation he was rescued by the discerning generosity of a young friend, named Calvert, who on his death in 1795, left him 900*l.* expressly as a token of his admiration and of his wish that he would devote himself to poetry. This sum, judiciously managed, enabled Wordsworth and his sister (who came to live with him about this time, and who exercised a wonderful influence over his spirits and his plans,) to live for some seven years, without any necessity on his part to undertake any employment incompatible with his freedom as a poet; and as it fortunately happened that, at the end of that time (1802), a sum of 8,500*l.* was paid over to the family by the second Earl Lonsdale in liquidation of the debt owing to their father by his predecessor, there was again a sufficiency of means for the poet's purposes.

In the autumn of 1795, Wordsworth and his sister settled at Racedown Lodge, near Crewkerne, in Dorsetshire; and here, living in a quiet and happy manner, he wrote his 'Salisbury Plain, or Guilt and Sorrow,' and began his tragedy of 'The Borderers,' neither of which was published till long afterwards. In June 1797, Coleridge, then residing at Bristol, paid his first visit to the Wordsworths; and "for the sake of being near him when he had removed to Nether-Stowey in Somersetshire, we removed," says Wordsworth, "to Alfoxden, three miles from that place." This was in August 1797, and one result of the intimate association thus formed between the two poets was the appearance in 1798 of the 'Lyrical Ballads,' a small duodecimo volume, published by Mr. Cottle of Bristol, the first composition of which was the 'Ancient Mariner' of Coleridge, and the rest, to the number of twenty-two pieces, Wordsworth's. The edition consisted only of 500 copies, the greater portion of which remained unsold; and when Mr. Cottle shortly afterwards gave up business, and sold his copyrights to the Messrs. Longman of London, the copyright of this little volume was valued at *nil*. Mr. Cottle therefore bought it back and presented it to the authors. Little affected by the indifference with which the volume had been received, or by the contemporaneous rejection of tragedies which they had respectively submitted to London theatre-proprietors, they were engaged in a new work. In 1798-9, they travelled together in Germany; and on their return, Wordsworth and his sister settled at Grasmere. Grasmere was his residence from 1799 to 1808, when he removed to Allan Bank in the same neighbourhood, and it was on account of his residence in this Lake district, and the congregation or occasional stay in the same beautiful region of other and kindred spirits such as Coleridge, Southey, De Quincey, and young Wilson, that the nickname of the "Lake School" was invented as a designation for him and his companions and disciples. From Grasmere and Allan Bank he made occasional excursions of business or pleasure. Thus in 1802 he made another tour in France; on his return from which he married Mary Hutchinson, whom he had known from her childhood. Wordsworth's sister still continued a member of the household, and the intellectual companion of William in all his labours. In 1803, the poet, his wife, and his sister set out on a tour in Scotland, in the course of which they made the acquaintance of Scott, and gathered observations and impressions which served as future materials and hints for many poems. Before their departure for Scotland, the poet's eldest child, a son, named John, was born; and the progress of his children were all recorded either at Allan Bank—a daughter, Dora, in 1804; a son, Thomas, in 1806; a second daughter, Catharine, in 1808; and the youngest, a son, named William, in 1810.

The period of Wordsworth's residence at Grasmere and Allan Bank (1799-1813) was the period of his memorable struggle against the critics, and of the slow and gradual recognition of his poetic genius. He was incessantly active, turning his observations and thoughts into poems, and he had projected and was occasionally labouring at his great philosophical poem in blank verse, which 'the Friends' and the 'Excursion' are the accomplished fragments. What he presented to the public however was his minor pieces. In 1800 appeared a second edition of the 'Lyrical Ballads,' in two volumes, with numerous additions; and there were subsequent editions in 1802 and 1805. In 1807 appeared a distinct collection of the poems; 'Poems in two volumes;' and in 1809 appeared his political prose 'Essay on the Convention of Cintra.' This last work was published contemporaneously with the first numbers of Coleridge's 'Friend,' to which Wordsworth contributed his 'Essay on Epitaphs.' In 1810 the poet wrote a portion of the letter-press for a volume entitled 'Select Views in Cumberland, Westmoreland, and Lancashire,' edited by the Rev. Joseph Wilkinson—a fine mark of his interest in the lake scenery, and his desire to diffuse the love of natural beauty. It seems to have been Wordsworth's theory not only that the enjoyments of nature has a medicinal effect on the minds of men in general, worthy of being systematically taken into account and resorted to, but also, that it is part of the functions of the poet to minister this influence of nature, by permanently connecting himself with some one spot or district, so as to transfer its peculiar facts and teachings into his lays. There is a greater fitness in the name 'Lake Poets' than was intended by those who invented it.

Wordsworth appeared professedly not only as a new poet, but also as the representative and champion of a new theory of poetry. In the volumes he had published up to this late he had not only exemplified his principles of composition in the poems themselves, but he had also propounded and illustrated those principles didactically in prose prefaces and dissertations. He believed, with Coleridge, that the period in the history of English literature intervening between Milton's age and his own had been, with a few exceptions, a kind of interregnum in English poetry—a period during which poetry had been prosecuted on false principles, both as to themes and as to style; and what he claimed for himself and for those who were associated with him, was the merit of reviving the true notion and art of poetry. The following summary has been given of his views:—"Poetry, according to Wordsworth, takes its origin from emotion recollected in tranquillity; what the poet chiefly does, or ought to do, is to represent out of real life, scenes and passions of an affecting or exciting character. How, then, originally placed in such scenes or actions, by such passions use a nervous and exquisite language expressly adapted for the occasion by nature herself; and the poet therefore in imitating such scenes and passions, will recall them more vividly in proportion as he can succeed in employing the same language. Only one consideration should operate to make him modify that language—the consideration, namely, that his business as a poet is to give pleasure. All such words or expressions therefore as though natural in the original transaction of a passionate scene, would be unpleasant or disgusting in the poetic rehearsal, must be omitted. Pruned and weeded in accordance with this negative rule, any description of a moving occurrence, whether in prose or in verse, would be true poetry. But to

Digitized by Google

secure still more perfectly their great end of giving pleasure, while they excite emotion, poets use the artificial assistance of metre and rhyme." In illustrating these views, as to the true nature of poetic subjects, and the true nature of poetic diction, Wordsworth was very severe in his criticism of the poets of the 18th century. Very few of them, he said, had looked at nature for themselves, satisfied with repeating over and over again images and allusions which had become a kind of *property* of the poetic corporation or guild, and which, though originally they might have arisen from genuine observation of nature, had by incessant repetition and attrition become mere lying artificialities; and so, also, very few of them had employed a diction at all resembling the language of real men and women under any circumstances, counting it rather the essence of their craft to use a certain conventional phraseology, called *poetic diction*, in which words were distorted out of their natural order, and the distortion regarded as metrical art.

These views naturally provoked opposition, as similar views had already done when urged by Bowles; and Wordsworth's own poems, exemplifying the views, were either neglected or severely criticised. In the interest of his views he had selected, for many of his pieces, very simple subjects, and had written a language as close as possible to that of real life; and these pieces were fastened on by the adverse critics and held up to ridicule as childish, grotesque, &c. Thus began the great literary controversy as to Wordsworth's poetry—a controversy which lasted almost to the end of Wordsworth's life, though by that time his triumph was, on the whole, decisive, and his admirers included the best part of the nation. The triumph was partly the result of time as affecting the appreciation of what he had already published, partly of the appearance of other poems, through the intervals from his retreat among the Lakes, each making a new impression and some revealing the poet's powers dissociated from those peculiarities which had jarred most on the critics of the old school. In 1813, he took up his residence at Rydal Mount, not far from his former habitations; and here he remained till his death, except for occasional visits to London, a second tour in Scotland in 1814, a new continental tour in 1820, a tour in Holland and Belgium in 1823, in North Wales in 1824, on the Rhine in 1828, in Ireland in 1829, in Scotland again in 1831, in Italy in 1837, &c. Before his removal to Rydal Mount, his children Catharine and Thomas had died, leaving two sons and a daughter still alive. His poems were as yet no source of income to him; but just at the time of his removal to Rydal Mount, he was appointed, through Lord Lonsdale's influence, to the distributorship of stamps for the county of Westmoreland, a post which, with light duties and the advantage of permitting him to remain in the district of his affections, afforded him about 500*l*. a year. In 1814 he published his great philosophical poem of 'The Excursion.' It had little commercial success, and drew down the critics upon him more than before—including Jeffrey's famous review of it as "this will never do;" but here and there it found readers who did not hesitate to recognise in it, as the world now recognises in it, one of the greatest poems in the English language. It was followed in 1815 by 'The White Doe of Rylstone;' this in 1819 by 'Peter Bell,' dedicated to Southey, and which, though not less attacked than the former poems, was more immediately popular; this, very shortly, by 'The Waggoner,' dedicated to Charles Lamb, and 'Sonnets on the River Duddon.' These poems had, most of them, been in manuscript long before they were published. In 1822 (by which time there had been new editions of some of the previous volumes, and in spite of all opposition, Wordsworth's name was pronounced everywhere as that of a literary power of the highest order) appeared Sonnets and other Poems under the title of 'Memorials of a Tour on the Continent;' several years afterwards appeared his noble series of 'Ecclesiastical Sonnets,' increased in subsequent editions; and in 1835, he published and dedicated to Rogers 'Yarrow Revisited and other Poems,' the result chiefly of his recent Scottish tour. Other collections of the pieces which he either had written long before or had recently penned were subsequently published; and in 1842 he published a collected edition of his poems in seven volumes, re-arranging them in a new order on a peculiar principle of his own, and with new titles to the separate divisions. Various editions of the whole, in different shapes, have been since published; and after Wordsworth's death appeared his autobiographical poem, 'The Prelude,' written in the early part of the century, and bringing down the narrative of his life till the period of his determination to Poetry after his first political schemes. The death of Wordsworth took place at Rydal Mount on the 23rd of April 1850, when he had just completed his eightieth year; and he was buried in Grasmere Churchyard. In 1839 he had been made D.C.L. of Oxford; in 1842 he had resigned his post of Distributor of Stamps in favour of his younger son, receiving a pension of 300*l*. a year; and in 1843 he had succeeded Southey as Poet-Laureate. His wife and his sister and his two sons survived him. His only daughter Dora had married in 1841 Edward Quillinan, Esq., a gentleman who had been in the army and who is known by various literary works. She was taken for her health to Portugal and Spain, of her travels in which countries she published a journal; and after her return she died in 1847.

The 'Memoirs of Wordsworth' in two volumes were published by his nephew Canon Wordsworth in 1851; and contain many letters, dictations, and conversations, illustrative of the occasions of his poems, of his character and habits generally, and of his progressive views of men and things. Though his life was one of stately retirement, he was a shrewd and diligent observer of all that occurred at home and abroad; and he expressed strong and decided views on the great political events and movements of his time, such as the war with Napoleon, Catholic Emancipation, the French Revolution of 1830, the Reform Bill, the Railway Mania, &c. His views on these subjects were generally Conservative and in contrast with those which he had held so strongly in early life; and in some of his letters and conversations he alludes to this apparent change and gives the philosophy of it. In 1818 he even mixed himself up with local politics in the Conservative interest by publishing 'Two Addresses to the Freeholders of Westmoreland.' He was during the last forty or fifty years of his life a zealous and devout supporter of the Established Church of England. A lofty and serene toleration however pervaded all his views; and his whole life was consecrated from first to last to the service of the great, the permanent, and the noble. His influence on the literature and especially on the poetry of Britain and America in this century, has been immense, and is far yet from being exhausted.

WORLIDGE, THOMAS, an English painter and etcher, born at Peterborough in Northamptonshire in 1700. He was first a pupil of Grimaldi, and then of Boitard, a scholar of La Fage. Worlidge is chiefly known for his drawings and etchings in imitation of Rembrandt. He copied also some of Rembrandt's most celebrated prints; there is a very good copy by him of the so-called Hundred Guilders.

Worlidge drew in black-lead and with Indian ink, on vellum, with extraordinary neatness. He made a set of 180 beautiful drawings of antique gems. His etchings, which are all in the style of Rembrandt, amount to 140; there are also several good portraits by him, like wise exact imitations of Rembrandt. Some of his admirers in his own time used to call him the English Rembrandt. Walpole says of him, "Thomas Worlidge for the greater part of his life painted portraits in miniature; he afterwards with worse success performed them in oil; but having acquired reputation and money by etchings in the manner of Rembrandt, proved to be a very easy task by the numbers of men who have counterfeited that master so as to deceive all those who did not know his works by heart. Worlidge's imitations and his heads in that manner have grown extremely scarce into fashion. One piece is the whole length of Sir John Astley, copied from Rembrandt: his print of the Theatre at Oxford and the act there, and his statue of Lady Pomfret's Cicero, are very poor performances." Worlidge's wife worked pictures in needlework with great skill. Worlidge died at Hammersmith, September 30, 1766.

WORM, OLAUS, Latinised WORMIUS, a distinguished Danish historian and antiquary, was born on the 13th of May 1588, at Aarhuus in Jutland, where his father was alderman; his family was originally from Guelderland. He was educated successively at the schools of Ripen, Flensburg, Lüneburg, and Schleusingen in the Rhine, where he lived three years under the care of some learned relations and friends of his father. In 1605 he went to the University of Marburg in Hesse, where he studied divinity; but he afterwards left divinity for medicine, and visited successively the universities of Giessen, Strasbourg, Basel, and Padua. The professors of the German students at Padua chose him their procurator and consiliarius anatomicus. After having travelled through Italy he went to Montpellier and Paris, and in both places he attended the medical schools. In Paris he became acquainted with Isaac Casaubon. He also visited the Netherlands and England. He was going to take the degree of M.D. at Marburg in 1611 when the plague compelled him to retire to Basel, where he became Doctor of Medicine in the course of the same year. As he had studied history and languages with great success, he was appointed, in 1613, professor of Eloquence in the University of Copenhagen, where he lived till his death, teaching successively literature, medicine, chemistry and physic. Five times he held the office of rector of the university. Cardinal Mazarin bestowed a pension upon him; and King Christian IV. of Denmark made him a dean of the chapter at Lund in Scania, and appointed him his private physician, which office he held till his death, under the successor of Christian IV., Frederick III. He died on the 31st of August 1654. Olaus Wormius is best known as an historian and antiquarian, although his merits as a physician were far from being inconsiderable. He is known in the history of anatomy by the bones of the skull named after him, *ossa Wormiana*, which he particularly described, though he did not, as is commonly supposed, discover them. The chief object of his studies was the earlier history and antiquities of Denmark, and in this department he has obtained a high rank. He also wrote on the history of Norway. His collection of Scandinavian and especially Danish antiquities was very rich; he made another collection of objects referring to the natural history of Denmark and the adjacent countries. These collections are described in the 'Museum Wormianum,' Leyden, folio, 1655, which was edited by William Worm, the son of Olaus. Albert Bartholin, in his work 'De Scriptis Danorum (Liber Posthumus),' p. 119, &c., gives a complete catalogue of the works of Olaus Worm: the principal are—I. Works on medicine, natural history, &c.: 1, 'Liber de Mundo: Commentarii in Aristotelem,' Rostock, 8vo, 1625; 2, 'Exercitationes Physicæ,' Copenhagen, 4to, 1623; 3, 'Selecta Controversiarum Medicarum Centuria,' Basel, 4to, 1611. II. Works on history, antiquities, &c.: 4, 'Literatura Danica antiquissima, vulgo

Digitized by Google

Gothica dicta,' &c., Copenhagen, 4to, 1636; folio, 1651; 5, 'Fasti Danici,' Copenhagen, folio, 1629; 6, 'Monumentorum Danicorum Libri VI.,' Copenhagen, folio, 1643; 7, 'Lexicon Runicum et Appendix ad Monumenta Denica,' Copenhagen, folio, 1650. This work is of great repute, and almost indispensable for those who study Scandinevian antiquities. 8, 'De Cornu Aureo,' Copenhagen, folio, 1641. This work gives a description of a large golden horn of beautiful workmanship, adorned with numerous figures and ornaments in relievo, which was in the possession of the kings of Denmark till it was stolen and melted down in the last century. 9, 'Historia Norvegiæ Vernaculæ,' Copenhagen, 4to, 1636. This history has been superseded by the excellent work of Torfaeus on the history of Norway. ('Vita Olai Wormii,' in the first volume of *Olai Wormii Epistolæ*, ed. Thomas Bartholin.)

* WORNUM, RALPH NICHOLSON, the son of Robert Wornum the well-known Pianoforte-maker, was born at Thornton near Norham, North Durham, on the 29th of December 1812. Having completed his general education at University College, then known as the University of London, in 1833, and having been led by a love of art to adopt the profession of a painter, he attended at Mr. Sass's Studio for three months; and then in the beginning of 1834 went abroad to prosecute the study of painting on the Continent. He resided for nearly six years at Munich, Dresden, Rome, and Paris, when he returned to London, at the close of 1839, and commenced his practice as a portrait painter. For some few years he combined the literature with the practice of art, but, finding the two to be incompatible, he eventually wholly occupied himself in art literature.

In 1840 Mr. Wornum became a contributor to the Penny Cyclopædia; and in the following year published the article on Painting in Messrs. Taylor and Walton's 'Dictionary of Greek and Roman Antiquities,' edited by Dr. W. Smith. He also contributed the lives of the Artists for the incomplete Biographical Dictionary of the Society for the Diffusion of Useful Knowledge; and wrote many articles for the Supplement to the Penny Cyclopædia. In 1846 he commenced a long series of contributions for the Art-Journal. In the same year he was authorised by Sir Robert Peel, then First Lord of the Treasury, to write the official Catalogue of the National Gallery of Pictures, which is still sold and has now, 1857, attained to the twenty-second edition: the first edition was published in 1847. In this year also was published the 'History of Painting, Ancient and Modern,' in 2 vols. 12mo, forming one of the works of 'Knight's Shilling volume.' In 1848 Mr. Wornum was appointed Lecturer on the History, Principles and Practice of Ornamental Art, to the Government Schools of Design in London and in the provinces. When these schools were constituted into a Department of Art under the Board of Trade in 1852, Mr. Wornum was appointed also Librarian and Keeper of Casts, and in this capacity he prepared for the department—1, 'Report on the Arrangement and Character of French Collections, and on the System of Instruction in Schools of Design in France,' published in the Appendix of the Report of the Department in 1853. 2, 'Catalogue of Ornamental Casts in the possession of the Department, &c. 3rd Division. Renaissance Styles Illustrated.' Roy. 8vo, 1854. 3, 'An Account of the Library of the Department, with a classified Catalogue of the works contained in it,' 8vo, 1855; and 4, 'Analysis of Ornament. The Characteristics of Styles: an Introduction to the Study of the History of Ornamental Art,' &c. Royal 8vo, 1856.

In addition to these works he prepared in 1848 for Mr. Bohn's Scientific Library an edition of Sir 'Lectures on Painting by the Royal Academicians, Barry, Opie, and Fuseli, with an Introduction and Notes;' and in 1849 for the same publisher an edition of 'Walpole's Anecdotes of Painting in England,' 3 vols. 8vo. In 1851 he wrote for the Art-Journal Illustrated Catalogue of the Universal Industrial Exhibition of that year, 'The Exhibition as a Lesson in Taste, &c. in which the different styles are compared, with a view to the improvement of Taste in home manufactures.' Prize Essay, 4to; and in 1855 he edited a Handbook to the Picture Gallery for Mr. Murray, under the title of 'A Biographical Catalogue of the Principal Italian Painters,' &c., 8vo. Upon the new organisation of the National Gallery, in 1855, Mr. Wornum was appointed Keeper and Secretary of that institution, and resigned his offices under the Department of Science and Art. In this capacity he drew up, in 1857, a 'Descriptive and Historical Catalogue of the National Pictures of the British School,' &c., now exhibited at South Kensington, comprising the Turner Bequest. He has also written a valuable work entitled 'Some Account of the Life and Times of Hans Holbein.' 1867.

By these various writings Mr. Wornum has done much to diffuse sound principles of taste, and correct information respecting the several schools of painting and the lives of the principal painters. The greater proportion of the biographies of the ancient, and several of those of the modern artists in the English Cyclopædia, have proceeded from his pen. All his writings are marked by careful and extensive research, by judicious criticism, and by good feeling. To his zeal and knowledge the public is also mainly indebted for the admirable manner in which so much of the Turner bequest, as the limited space permits, has been prepared for exhibition.

WORONICZ, JAN PAWEŁ, archbishop of Warsaw, and one of the most eminent Polish writers of his time, both in poetry and pulpit eloquence, was born in 1757. Educated in one of the Jesuit seminaries, he entered that order at an unusually early age, and on its abolition (1772), into the 'Society of Missionaries.' Here he soon began to attract the attention of some of the higher clergy, more especially of the bishop of Cholm, then vice-chancellor, who intrusted him with preparing many important official papers, for which services he was rewarded with the deanship of Lvov. On the partition of Poland, in 1795, he retired to the small town of Kazimiers, where he took upon himself the duties of a parish priest, and where, being in the neighbourhood of Pulawy, the country-seat of the Princess Isabella Czartoryski, he became acquainted with that accomplished woman. It was then that, inspired both by her society and by the enchanting scenery which Delille has celebrated in his 'Jardins,' he produced his 'Sybylia;' the idea of which was suggested by the so-called 'Temple of the Sibyl,' at Pulawy, and which is esteemed the finest specimen of historical poetry in the language. When the duchy of Warsaw was established in 1808, he was made both a member of the council and dean in the chapter of the cathedral; and through the influence of the Czartoryski family, was nominated by the emperor Alexander to the bishopric of Cracow in 1815. Twelve years afterwards the emperor Nicolas raised him to the dignity of archbishop of Warsaw and primate of all Poland; but he was labouring under infirmities which induced him to go abroad for medical advice, and while thus travelling, he died at Vienna, October 16th, 1829.

Besides his 'Sybylla,' he wrote several other poetical compositions of merit, and one of them, 'Sejm Wielicki,' or the Diet of Wielica, though only a fragment of what was perhaps intended to be an historical epic, is thought by some to display greater power than his first more celebrated production. His poetical fame however is fully rivalled by that of his prose writings. 'In sermons,' says Szyrma, the author of the 'Letters on Poland,' "excel in boldness of conception akin to those of Herder, and seem to be the instantaneous emanations from the pure source of religious morality—the more impressive, as they are couched in an energetic dithyrambic language, like that of the prophets of old." They were published at Moscow, in 8vo, 1829, under the title of 'Kazania, cyli Nauki Parafjalne.'

WORONZOW (VORONTZOV), COUNT MIKHAIL ILARIONOVICH, Russian chancellor and diplomatist, was born July 12th, 1714, and at the age of fifteen obtained an appointment as page at the court of the grand-duchess Elizabeth, in whose household he remained some years after (1741) took a principal part. His services on that important occasion secured him not only the empress's favour, but various orders and marks of honour from foreign potentates. The office of vice-chancellor, under Bestuzhev-Rumin, was however so little agreeable to him, that he sought to decline it by retiring abroad under a pretext of ill-health, yet after so passing about two years in Germany, Italy, France, and Holland, he returned and undertook its duties. He had not long done so, before he was accused (1748) of plotting to depose Elizabeth, and place the grand-duke Peter (III.) on the throne, but he succeeded in fully exculpating himself with the empress.

Ten years later, on the downfall of Bestuzhev-Rumin, he became chancellor, and, so long as he held that arduous office showed superior ability as a statesman; but after Catherine II. had ascended the throne, his influence waned, at least the enmity of several of the more powerful nobles towards him showed itself in such manner, that he sought to avoid worse consequences by absenting himself, as formerly, under the pretext that travelling was necessary for his health (1763), which request was appointed to set at his deputy in the meanwhile. On his return to Russia, finding his opponents no better disposed towards him than before, he solicited permission to resign office altogether, and retired to Moscow, where he died February 13 (o.s.), 1767.

Woronzow had many of the qualities that mark a superior statesman, and was in other respects a noble character. He patronised the literature of his country in the person of Lomonosov, to whom he erected a monument, besides purchasing all the manuscripts and papers he had left. Count Michael's only offspring was a daughter, married to Count Alexander Strogonov; but he was the uncle of three females, the most distinguished of their time and country for beauty and for talents: these were the daughters of his elder brother, Count Roman Ilarionovich (1707—1783).—Maria, the beautiful Countess Buturlin; Elizabeth, the wife of Colonel Polyansky; and Catherine, the no less eccentric than accomplished Princess Dashkov.

WORONZOW, MIKHAIL SEMENOVICH, PRINCE, a very distinguished Russian statesman and soldier, was born at Moscow, in 1782, the son of Semen or Simon Woronzow, who was nephew of the chancellor Woronzow, and brother of Princess Dashkov [Dashkov]. Semen Woronzow was for many years Russian ambassador to England, where he was first sent by the influence of Prince Potemkin, in 1784, and where he remained in that capacity till 1806, when, retiring from the service, on account of ill-health, he obtained permission from his government to remain in England, and resided in London as a private gentleman till his death, in 1832, at the age of eighty-nine. His son was educated in England, his daughter, who died in 1856, married the late Earl of Pembroke, and was mother of the late Lord Herbert. Mikhail Woronzow, living in England to the age of sixteen, was as familiar with the English language and manners as many of his countrymen are with the French. He was a warm admirer of

Digitized by Google

England, and the country of his education certainly had no cause to blush for its pupil. At the age of nineteen he entered the Russian army, in which he fought under Kutuzov against the Turks, and took a distinguished part in the great campaigns against Napoleon I. He commanded a division at the battle of Borodino, where he was severely wounded, and he led the Russian cavalry at the battle of Leipzig. It is said that on a subsequent occasion, in 1824, his conduct in action elicited from Napoleon the exclamation, "That is the stuff of which marshals are made." Several interesting notices of his opinions and conversation at the time of the occupation of Paris by the allies after Waterloo, are to be found in the diaries of his friend, Sir John Malcolm, printed in the recent Life of Sir John, by Kaye. He commanded the Russian contingent in France from 1815 to 1818, and is said to have paid an enormous sum from his private purse to avoid the disgrace of leaving the debts of Russian officers unpaid when they evacuated the country. In 1823, after his return to Russia, he was appointed Governor of New Russia and Bessarabia, a post which he held for many years, only quitting it for a short time in 1828, to take the command of the Russian army after Menshikov had been wounded at the siege of Varna. To this command was added in 1844, that of the Caucasian Provinces, with an authority superior to that of any preceding governor, Woronzoff being made dependant on the Czar alone. He adopted as far as possible a policy of conciliation to the native tribes, while at the same time he pursued the war with such vigour, as to capture in 1845 the stronghold of Shemyl, the town of Dargo. The bravery and obstinacy of the mountaineers rendered his military success at the time seem of the slenderest, but he succeeded in introducing great improvements into the other countries under his government, building towns, making roads, promoting the cultivation of the vine, and setting in general an example of disinterestedness and high feeling. He always continued attached to the land of his youth, he was fond of receiving Englishmen, and his country-seat or palace at Alupka in the Crimea, the finest in the country after the imperial residence of Orianda, was built from the designs of an English architect, Mr. Papworth. He is understood to have been averse to the Russian war with England and France on the Turkish question, in which, by a somewhat singular combination of circumstances, his nephew was the English secretary at war. During the early progress of it he was kept by ill-health at Tiflis, and in March 1854 he obtained six months' leave of absence, which he spent at Karlsbad and Schlangenbad, but with so little benefit, that in October of the same year he solicited and obtained permission to retire. He died on November 18th 1856 at Odessa, leaving behind him a high reputation among both natives and foreigners for probity and independence.

• WORRING, ANDREW, manager of the Imperial Printing Office at Vienna, and whose name is intimately associated with the new art of Nature-Printing, was born at Vienna, about the year 1806. Having entered the printing-office at an early age as a compositor-student, he subsequently devoted his services to type-founding; after having acquired which, he paid great attention to the more important and interesting branch of the business, also practised in that establishment, the punch-cutting. He eventually succeeded Mr. Paul Fretsch in the department of galvano-plastics. Here the practical genius of Mr. Worring was called into operation in a new line by the idea of Professor Haidinger in the year 1852, which however might have become abortive, if it had not been for the skill and experience of Mr. Worring, who made the experiments, and after the exercise of much labour and display of intelligence conducted them to a successful result. The first experiments were made in the simple transfer of laces, patterns, &c.; but they afterwards embraced leaves and flowers, to the botanical illustration of which they were eminently applicable.

Everything that emanates from the Vienna printing-office, being a government establishment, comes out under the auspices of the director, and therefore the first specimens which appeared bore the name of Auer. It was attempted to introduce these specimens into England as a mercantile transaction; but after a provisional patent had been obtained, the scheme was abandoned. It was again attempted to procure attention to them, by inserting them as illustrations to a pamphlet, and for this purpose they were presented to some literary and scientific institutions. The pamphlet, as a history of the new art, was comparatively of little worth. Its object was to assert, with more violence than argument, that the secret of the process had been surreptitiously obtained; and amidst its assertions were introduced personalities adverting to matters that had no reference whatever to the case at issue. No serious reply was made to these attacks. The interest of the subject of Nature-Printing, and its successful introduction to this country, demand a few words of explanation, which have been furnished to us. Mr. Henry Bradbury was a student at the Imperial Printing Office of Vienna at the time of the alleged discovery. Of course, the mysteries and manipulation of its different departments were communicated to him in such capacity, and he judged, as many of the greatest benefactors of industry have thought before him, that he had every right to make use of his knowledge and skill for the benefit of his own country. No guarantee to the contrary could be exacted, so none could be given. How far this pamphlet, printed in four different languages, has effected its object abroad, is shown by the gifts from crowned heads to the person assailed, for securing to England decidedly the finest specimen of the art. A Lecture on Nature-Printing, delivered at the Royal Institution of Great Britain in 1855, and published by Mr. Bradbury, plainly showed that the so-called invention of Auer was not original, and therefore there could have been no surreptitious adaptation of the process.

Frankly admitting the beauty of the specimens from the Vienna Imperial Printing Office, which had been forwarded to Denmark, Professor Thiele of Copenhagen had at once thrown down the gage in behalf of a Danish goldsmith, named Kyhl, as the inventor of the art. Nor, indeed, is it at all unlikely that Kyhl, in a practical point of view, was the inventor. Although it must be admitted, that there may be independent attempts at the perfecting of a common idea, that there always are under-currents of information, which lead to a final result. This is more than hinted at by Professor Thiele, who strongly alludes to the probability of Kyhl's process having become divulged by his manuscripts. Even before the appearance of Councillor Auer's so-called specimens (for it may be observed that subsequently Councillor Auer withdrew his signature from the plates), a great many gentlemen in England had been exercising their ingenuity in the same channel, and had even assumed to be inventors, but the practical turn which they adopted, was rather to the ornamentation of metals, than to the illustration of botanical works. In this consists the great value of the practical skill of Mr. Worring: for the specimens of his art show that it is admirably adopted to confer all the advantages of an Herbarium, without any of its defects. The works that have already been issued from the Vienna press, under the auspices of Mr. Worring, are: Specimen floræ Transsylvaniæ vallis Arpasch, carpatæ Transilvani,' folio, with 7 plates, Vienna, 1853; 'Physalotypia Plantarum Austriacarum der Naturselbstdruck in seiner Anwendung auf die Gefässpflanzen des österr. Kaiserstaates,' 5 vols. large fol., with 500 plates, and 1 vol. 4to, with 30 plates, Vienna, 1855; 'Die Algen der dalmatinischen Küste mit Hinzufügung der von Kützung im adriatischen Meere überhaupt aufgefundenen Arten,' 20 plates, Vienna, 1855.

In this country the exemplification of Nature-Printing in its application to the illustration of plants has been carried out on a magnificent scale by Mr. Bradbury, in his 'Fern Flora of the United Kingdom,' folio, with 51 plates, under the editorship of the celebrated botanist, Dr. Lindley. While engaged in bringing out this work, he delivered the lecture at the Royal Institution of Great Britain, already alluded to, on 'Nature-Printing, its History and Objects.' He entered very fully into the former, and besides the crude endeavours of Kyhl, he advanced another claimant for the honour of invention, if any, in the person of Professor Kniphoff,[1] in 1761, whose specimens, amounting to 1200, coloured, were of great beauty and perfection, and had so to have excited the attention of Linnæus. The question had then become so public that it was successively taken up by the 'Quarterly Review' and the 'Athenæum.' Whatever may be the true history of the discovery, which seems likely to remain a quæstio vexata, there can be no doubt that for the successful introduction of Nature-Printing, as an adjunct to botany, we are indebted to Mr. Andrew Worring.

(*Die Entdeckung des Naturselbstdruckes, &c.*, by Councillor Auer, Vienna, 4to, 1854; *Berlingske Tidende*, No. 123, by Professor Thiele, Copenhagen, 1853; *Nature-Printing, its History and Objects*, by Henry Bradbury, London, 4to; *Quarterly Review*, January 1857; *Athenæum*, May 2, 1857; *Literary Gazette*, 1857.)

• WORSAAE, JENS JACOB ASMUSSEN, a Danish antiquary, well known in England, was born at Veile, on the 14th of March 1821, the son of a justiciary, or legal functionary, whose birthplace was Worsaae in Wendyssel. In 1838, at the age of seventeen, he entered the University of Copenhagen as a student, and in the same year he was appointed one of the assistants in the Royal Museum of Northern Antiquities which had been called into existence by the zeal and energy of C. J. Thomsen. At the university he read with a student of theology and afterwards of law, but he was fortunately enabled from his outset in life to devote himself to his favorite pursuit of antiquities. At the age of twenty-one he went on an antiquarian tour at the public expense through parts of Sweden and Norway, and made some researches which were afterwards embodied in one of his most interesting publications, 'Runsamo og Bravallie-slaget,' (Runamo and the Battle of Bravalla), 4to, Copenhagen, 1844. The transaction to which this pamphlet relates is one of the most curious, and at the same time one of the most instructive, in the annals of antiquarianism. Saxo Grammaticus, the Danish historian, writing in the 12th century, and relating the exploits of a certain king, Harold Hildetand, who was killed at the battle of Bravalla, of which the date is so uncertain that Olaus Wormius assigned it to the 3rd century after Christ, while recent antiquaries place it in the 8th, records that the king caused the exploits of his father to be inscribed on a portion of a rocky path in Bleking, a district which now forms a province of Sweden, and that King Waldemar the Great, in whose reign Saxo Grammaticus lived, feeling desirous to know the meaning of the inscription, had sent some men to examine it, but they had been unable to make it out, owing to the characters being partially filled up with dirt and injured by the tramp of passengers. Olaus Wormius, the Danish antiquary of the 17th century, rediscovered what he thought to be the inscription

[1] 'Botanices in Originali seu Herbarium Vivum,' by D. J. H. Kniphoff. Halæ, Magd., 1761.

Digitized by Google

referred to at place called Runamo in Bleking, but to him it was as unintelligible as it had been to the emissaries of King Waldemar. Doubt began to arise in the 18th century and to spread in the 19th, as to whether the inscription was an inscription at all; a Swedish antiquary named Brooman and the eccentric Danish antiquary Arendt maintained that the scratches and figures which were observed in the rocky path at Runamo were nothing more than a freak of nature, that Saxo Grammaticus had merely retailed an idle tradition, and that if King Harold Hildetand, or any one else, had wished to cut an inscription in that part of Bleking, he would hardly have chosen a rough horizontal rock when upright and perpendicular rocks were at hand for the purpose. The question at last excited so much interest that, in 1833, the Royal Danish Scientific Society determined to send a commission of learned men to Bleking to examine the spot. Ominously enough they found that the disputed marks were cut in a piece of trap-rock. The geologist Forchhammer did not hesitate to pronounce that many of the marks were to be attributed to natural causes, others he considered to be the work of human hands, and he carefully pointed out which, in his opinion, were owing to one cause and which to the other. Three drawings were made, one of the natural marks, another of the artificial, and a third of the two combined, presenting, it was said, a facsimile of the inscription as it appeared to the ordinary spectator, and the three were engraved for the 'Transactions of the Copenhagen Society.' Finn Magnussen, the celebrated Icelandic scholar, who was one of the commission, found himself unable to decipher the mystic inscription when on the spot, and for months afterwards laboured at it in vain. This ignorance was destined to be suddenly dispelled. "On the 22nd of May 1834, in the afternoon," he says in the great work he afterwards published on the subject, "when I had been looking over the first proof of the first impression of the copper-plate, which represents those parts of the inscription which were recognised by Professor Forchhammer as cut in or punctured by art, the idea chanced to come across me of trying to read the inscription backwards, or from right to left. I immediately read off without the slightest difficulty the word Hiilteknn, and the others followed soon after without any particular trouble by reading the letters in this direction, and also, according to the rules by which, in Iceland and other countries, what are called Binderuner (complex or entangled Runes), are usually deciphered."

The discovery produced a sensation in the antiquarian world, and was made known in all its bearings in the 'Transactions' of the Society in an article which filled a quarto volume of more than seven hundred pages, and which was afterwards issued in a separate shape by Magnussen under the title of 'Runamo og Runerne' (Runamo and the Runes), Copenhagen, 1841. The controversy might now be supposed to be fairly at an end, but it revived anew, with more vigour than ever. Berzelius, the eminent Swedish chemist, hearing of the affair while on a visit to Copenhagen, went to Bleking to examine the spot. Magnussen's work was published, on purpose to examine the inscription, and entirely disagreed with Forchhammer, coming to the conclusion that all the marks in the rocky road which were not produced by nature were produced by wheels. Nilsson of Lund, the eminent Swedish antiquary, coincided with Berzelius. The controversy Worsaae had been originally aroused by the great amount of curious facts that the inscription in Magnussen's hands, and as read by him, was made to prove. Saxo Grammaticus had been considered a retailer of romantic fables, but the inscription coincided to such a degree with his narrative as to show that his opinion must be erroneous; it also proved that the language now called Icelandic was in use in Bleking in the time of Harold Hildetand, and not only so, but that Icelandic verse of the kind called 'Fornyrthalag' or 'Old Metre,' the same into which Thorlaxson translated 'Paradise Lost' in the 19th century, was current at least as early as the 8th. This led Worsaae to examine the rock of Runamo with some curiosity, first in 1842 and afterwards in 1844, when he had with him a copy of the engravings which had been published by the Danish Society. "The first glance," he tells us, "showed me that my subsequent comparisons and examinations have brought to a complete certainty—that the representations of the trap at Runamo taken by Forchhammer's direction are altogether unreliable." "I could not therefore have the slightest doubt," he adds, "that Finn Magnussen's whole reading and interpretation of the inscription which was grounded on this drawing were completely wrong." Worsaae published in his pamphlet, side by side with the old 'portrait of Runamo,' a new portrait taken by another artist, which was entirely different. He contended, with a strong array of facts and arguments, that in his supposed discovery the Icelandic scholar must have been the dupe of his own imagination, and that the inscription he believed he had read was as unreal as the delineations which fancy often sees in a winter's fire. It required no little courage in a young and comparatively unknown Danish writer thus openly to assail the work of one of the literary magnates of the land given to the public by the most distinguished scientific body. But his cause was gained; the verdict has gone against Finn Magnussen. In his 'Runamo og Runerne,' Magnussen had also given a translation of the inscription on the coliimn at Rathwell, which was afterwards criticised with great severity and effect by J. M. Kemble. It is now therefore generally considered that, with undeniable learning and ingenuity, and many merits, the great Runic scholar was not to be trusted in Runes.

The other works of Worsaae are numerous, and are all marked by a character of sobriety and soundness. His 'Danmarks Oldtid oplyst sed Oldsager,' literally 'Denmark's Old Time illustrated by Old Things,' (Copenhagen, 1843,) appeared in England under the title of 'The Primeval Antiquities of Denmark, translated and applied to the illustration of similar remains in England, by W. J. Thoms' (London, 1849), with a preface in English by the original author. The translation, which had the benefit of his revision, was made from a German translation which he had also superintended, and to which a tour in Prussia, Austria, and Bavaria, in 1845, had given him the power of the expectations which had been formed of it, and containing little that might not have been written without a tour. An essay by Mr. Worsaae on the Antiquities of Ireland and Denmark is inserted in the 'Proceedings of the Royal Irish Academy,' and short contributions from his pen on other archæological subjects have appeared in some of the Scandinavian periodicals. He repeated his visit to England in 1852, made in the same year a tour in France, and in 1854 went to Germany and Italy. In his own country his merits were recognised by his appointment, in 1847, as Inspector of Antiquarian Monuments in Denmark, and by a member of the royal commission for the preservation of antiquities, and, when two years later this commission was broken up and two persons recommended in its stead to discharge its duties, the two were Thomsen and Worsaae. In 1854 he received the honorary rank of professor. He is a warm patriot, and among his lesser writings may be cited in defence of Scandinavianism, on the formation of a closer league between the Scandinavian countries to resist the pressure of foreign influence, a subject on which he has been engaged in controversy with Professor Munch, the Norwegian. [MUNCH.] His most important recent publication is his 'Afbildninger fra det kongelige Museum for Nordiske Oldsager' (Illustrations from the Royal Museum of Northern Antiquities), Copenhagen, 1854,

WORSLEY, SIR RICHARD, BART., was born in 1751, in the Isle of Wight. His father was Sir Thomas Worsley, and Richard succeeded to the title when he was about eighteen years of age. He soon afterwards travelled on the Continent, and remained a considerable time at Rome, where he purchased a variety of pieces of sculpture and other remains of ancient art.

Sir Richard Worsley, after his return to England, sat in the House of Commons for many years as one of the representatives of the borough of Newport in the Isle of Wight. He was comptroller of the royal household to George III., and and also the office of governor of the Isle of Wight, where he died August 8, 1805.

Sir Richard Worsley published a 'History of the Isle of Wight,' 4to, London, 1781, with engravings. The history is natural, civil, military, commercial, and antiquarian; but except in mere matters of historical detail, most of them dull enough. Worsley's work was superseded by Sir Henry Englefield's 'Description of the Isle of Wight.' Richard Worsley also published 'Museum Worsleianum; or a Collection of antique Basso-Itelievos, Busios, Statues, and Gems; with Views of Places in the Levant, taken on the spot in the years 1785, 86, and 87,' 2 vols. folio, London, 1794-1803. He was assisted in the arrangement and description of his collection by Ennio Quirino Visconti. It was printed by Bulmer, and the style of its publication was considered to be, in typography and embellishments, one of the most splendid works which had issued from the English press. Very few copies were printed; some authorities say only fifty, but others two hundred and fifty, and the total expense to Sir Richard was about 27,000*l*.

WOTTON, EDWARD, was born at Oxford in 1492. He studied at the University of Oxford, and took his Bachelor's degree in 1513. He was subsequently appointed, by Bishop Fox, Greek lecturer at Corpus Christi College. In this position he remained till 1520: he then travelled into Italy, and having visited the principal cities, he graduated in medicine in the University of Padua, in 1523. He took his degree of Doctor of Medicine at Oxford in 1525, and became a Fellow of the College of Physicians of London. He was afterwards appointed physician to Henry VIII. He devoted much attention to the study of natural history, and published at Paris, in 1552, a work entitled 'De Differentiis Animalium.' This work is spoken highly of by Gesner. It does not contain any new matter of his own, but was an epitome of the natural history of his day. It is written in elegant Latin. He began a history of insects, but this work was never published. He died October 5, 1555.

WOTTON, SIR HENRY, was born April 9 (30th March, O.S.), 1568, at Boctou Hall, "commonly," says his biographer, Izaak Walton, "called Boctou or Bougton Place," in the more modern accouts written Boughton Hall, in the parish of Boughton-Malherbe, in the county of Kent. Here his ancestors, several of whom had held distinguished employments in the state, had been seated for many gene-

Digitized by Google

rations. His father, Thomas Wotton, Esq., was twice married: first, to Elizabeth, daughter of Sir John Rudstone, Knight, by whom he had three sons; Edward, knighted by Elizabeth, and in 1603 raised to the peerage as Baron Wotton by James I., and James and John, also both knighted by Elizabeth; secondly, to Eleanora, daughter of Sir William Finch, of Eastwall in Kent, and widow of Robert Morton, Esq., of the same county, by whom he had Henry, the subject of the present notice.

Henry's first teacher is stated to have been his mother; he then had a resident tutor; afterwards he was sent to Winchester school; thence, at the age of sixteen, he was removed to Oxford, and admitted a gentleman commoner of New College; finally, two years after, in 1586, he transferred himself to Queen's College. The first year he was a member of this society he composed, at the desire of the provost, a tragedy entitled 'Tancredo' (in what language is not stated), which, according to Walton, was greatly admired; but it has not been printed. Walton says that about the twentieth year of his age he proceeded Master of Arts, on which occasion he read with great applause three lectures, in Latin, on the eye; and Wood, although he could not discover any record of his admission to this degree, notes that on the 8th of June 1588, he put up a grace or petition, to the university, to be admitted to the reading of any of the books of Aristotle's Logic, which was granted, and was probably for his degree of A.B. After his optical lecture, Walton tells us, he was taken into the closest intimacy by the learned Italian Albericus Gentilis, then professor of civil law at Oxford; and from him he first acquired not only a large knowledge both of law and mathematics, but a complete mastery of the Italian language. In the next year, 1589, his father died, leaving to each of his three younger sons an annuity of a hundred marks; and Walton intimates that this event prevented his remaining so long at Oxford as his friends once intended; afterwards adding, however, "in Oxford he stayed till about two years after his father's death; at which time he was about the two and twentieth year of his age: . . . he then laid aside his books, and betook himself to the useful library of travel." But in one of his letters to Lord Zouch, dated 10th July 1592, he says that he had been then three years upon his travels. Walton goes on to state that he was abroad almost nine years, one of which he spent in France, "and most of that in Geneva," where he became acquainted with Theodore Beza (then of great age), and with Isaac Casaubon (in whose house Wotton had heard he was lodged): "Three of the remaining eight years," it is added, "were spent in Germany; the other five in Italy . . . . where, both in Rome, Venice, and Florence, he became acquainted with the most eminent men for learning and all manner of arts, as painture, statuary, architecture, chymistry, music, and other manual arts, even arts of inferior nature; of all which he was a most dear lover, and a most excellent judge. He returned out of Italy into England about the thirtieth year of his age, being then noted by many both for his person and comportment; for indeed he was of a choice shape, tall of stature, and of a most persuasive behaviour," &c. But, notwithstanding the particularity with which all this is related there must be some error. The account would make Wotton to have got back to England in 1598, or 1597, at the earliest; and he was now, his biographer proceeds to inform us, taken into the service of the Earl of Essex as one of his secretaries, and "did personally attend the earl's councils and employments in two voyages at sea against the Spaniards, and also in that (which was the earl's last) into Ireland, that voyage wherein he then did so much provoke the queen to anger," &c. Now Essex set out on his first expedition to Spain in June 1596, and on his second in August 1597; both dates antecedent to that at which Walton makes Wotton to have been taken into his service. It is probable that Wotton either went abroad sooner, or did not stay away from England so long as his biographer makes him to have done. Essex went to Ireland in March 1599, and returned in September of the same year; upon which he was immediately placed in free custody, and although afterwards set at liberty, he was again apprehended in February 1601, and, having been brought to trial and convicted of high treason, he was executed on the 25th of that month. Wotton, Walton tells us, as soon as he heard of Essex's second apprehension, and committal to the Tower, "did vary quickly, and as privately, glide through Kent to Dover, without so much as looking toward his native and beloved Boscum; and that way, by the help of ecstasy and gold, and liberal payment of the mariners, within sixteen hours after his departure from London set upon the French shore." There is no reason however to suppose that Wotton was involved in the earl's treason, like his brother secretary Cuffe, who was hanged.

From France Wotton proceeded to Italy, and took up his residence among his old friends at Florence, whence after some stay he went on a visit (called his fourth) to Rome, returning to Florence, Walton says "about a year before the death of Queen Elizabeth," which would be about March 1602, or about a year after he had left England. It appears to have been in this first year of his residence abroad that he drew up his treatise entitled 'The State of Christendom, giving a perfect and exact discovery of many political Intrigues and secret Mysteries of State practised in most of the Courts of Europe; with an Account of their several Claims, Interests, and Pretensions,' first printed in folio in 1657, and again in 1677. It was immediately after Wotton's return from his visit to Rome that the reigning grand-duke of Tuscany, Ferdinand I., intercepted certain letters discovering a design to take away the life of King James of Scotland, and on the advice of his secretary Signor Vietta, who was an intimate friend of Wotton, resolved to employ Wotton to communicate the affair to James, and accordingly, says Walton, "acquainted him with the secret, and, being well instructed, dispatched him into Scotland with letters to the king; and with those letters such Italian antidotes against poison as the Scots till then had been strangers to." This mission proved the foundation of Wotton's after fortunes. Calling himself Octavio Baldi, and assuming the character of an Italian, he made his way to Scotland, the better to escape notice, through Norway, and found King James at Dundee. Having announced himself as an ambassador from the Duke of Tuscany, he was soon admitted to the royal presence through means of Bernard Lindsey, a gentleman of the bedchamber, not however without having been requested when he came to the presence-chamber door to lay aside his long rapier. Three or four lords were standing "distant in several corners of the chamber;" on seeing whom he hesitated; but James desired him to be bold and deliver his message, for he would undertake for the secrecy of all that were present. "Then," continues the narrative, "did Octavio Baldi deliver his letters and his message to the king in Italian; which, when the king had graciously received, after a little pause Octavio Baldi steps to the table, and whispers to the king in his own language that he was an Englishman, beseeching him for a more private conference with his majesty, and that he might be concealed during his stay in that nation; which was promised, and really performed by the king during all his abode there, which was about three months, all which time was spent with much pleasantness to the king, and with as much to Octavio Baldi himself as that country could afford."

A few months after Wotton's return to Florence news arrived of the death of Queen Elizabeth, and, guided by his wife's duke's advice, he immediately proceeded to England, where he found that James had not forgotten him, but had already been making inquiry after him of his brother Sir Edward, afterwards Lord Wotton, whom the king upon his arrival in London found holding the post of comptroller of the household. Wotton immediately received the honour of knighthood, and the next year (1604) was sent as ambassador to Venice, accompanied by Sir Albertus Morton, his nephew, as his secretary. It was while he stayed for a few days at Augsburg, on his way to Venice, that he wrote in the album of a German friend his famous definition of an ambassador—"Legatus est vir bonus peregre missus ad mentiendum reipublicæ causa" (an ambassador is an honest man sent abroad to lie—it is commonly rendered, sent to lie abroad—for the good of his country); which eight years after was published by Scioppius, with rancorous bitterness, as a libel against King James, as a principle of the religion professed by that king. James was at first very angry with Wotton, but was ultimately appeased by an apology addressed to himself, and another letter on the subject in violent abuse of Scioppius, which Wotton wrote to a friend, Marcus Velserus, a native of the duumvirate of Augsburg. In his own account, it is observable, Wotton says nothing about the equivoque in the English term lie, which is made a principal point of the story as it is commonly told; nor indeed does it appear how he could have intended a double meaning in a term which he himself hit. He had returned from this first mission to Venice before he wrote his letter to Velserus, which is dated at London, 2nd December 1612. The writer of his life, in the 'Biographia Britannica,' says that he came home in 1610, and conceives that he was probably recalled in consequence of the publication of Scioppius's definition. Be this as it may, he seems to have remained four or five years from this time without employment. There is some reason however to suppose that he had a seat in the short parliament which met 5th April 1614, and was dissolved 7th June following. There is no printed list of the members of this parliament, but Sir Henry, in a letter dated a few days after its dissolution, speaks of the late House of Commons by the expression "our house." At last, towards the close of 1615, he was sent on a mission to the United Provinces, and on his return in the beginning of the following year he was appointed to the Venetian embassy. He resided at Venice three years, and then returned to England, according to the 'Biographia Britannica,' in July 1619, with the hope of being appointed to the place of secretary of state, vacant by the death of Sir Ralph Winwood. But that event had taken place a year and nine months before, so that there must here be probably some mistake. According to the same authority, he was in 1619, and the following year, sent again abroad, first as ambassador-extraordinary to the Duke of Savoy, and then several times into Germany upon the affairs of the elector-palatine; "after which," it is added, "being remanded a third time to Venice, with directions to take the round thither through Germany, he returned not to England till the year of King James's death," that is to say, in 1625. But he was certainly back here by 1624 at the latest: Walton says that he came to London "the year before King James died;" and even the account in the 'Biographia Britannica' proceeds, somewhat inconsistently, to inform us that "not long after his arrival, upon the death of Mr. Thomas Murray in 1623, he succeeded him in the provostship of Eton College." Walton's narrative implies that this place was given him by King James, who had previously, it seems, granted him the reversion of the place of master of the rolls, then held by Sir

Digitized by Google

Julius Cæsar; but Wotton, who was in a state of great pecuniary necessity, required, we are told, a present support, and very gladly resigned his reversion upon getting a grant of the provostship. He was not instituted however, it appears, till 26th July 1625, some months after the death of James. Conceiving himself bound by the statutes to enter into holy orders, he had himself ordained deacon in 1627; and he retained his office till his death in December 1639. Walton has given a very interesting account of the manner in which he employed the leisure of his latter years; he did not neglect recreation and society, but most of his time was dedicated to study and devotion, and whatever ambition of politics, power, and honours had formerly actuated him, seems to have been, from the time he obtained this shelter in his broken fortunes and wearied old age, completely extinguished.

Sir Henry Wotton's principal writings are contained in the collection entitled 'Reliquiæ Wottonianæ,' first published by Izaak Walton, with a Life of the author, in 8vo, in 1651, and afterwards, with additional matter in each impression, in 1654, 1672, and 1685. The principal pieces of which it consists are—a treatise, long held in great esteem, entitled 'The Elements of Architecture,' originally published in 4to, at London, in 1624; 'A Philosophical Survey of Education, or Moral Architecture' dedicated to Charles I.; Characters of some of the English kings (intended as materials for a History of England); a Latin Panegyrical Address to King Charles on his return from Scotland in 1633 (first published in folio, at London, in 1635), with an English translation by Walton; 'A Parallel between Robert Devereux the Earl of Essex and Villiers, Duke of Buckingham' (first published in 4to, at London, in 1641); 'A View of the Life and Death of the Duke of Buckingham' (first published in 4to, at London, in 1642); some religious Meditations; and a number of Letters and Poems. More of his letters are in Izaak Walton's; and there are several others attributed to him which are not in the 'Reliquiæ.' His 'State of Christendom' has been already mentioned. The literary reputation of Sir Henry Wotton rests now principally on his poetry, which, although consisting only of some short pieces, is distinguished both by its general correctness, and by the occasional display of a degree of thought and expression scarcely attained by any of his contemporaries. In his lifetime he was famous for his pointed sayings; but here the manner, as usual, probably went as far as the matter in creating the impression that was produced. There seems to be nothing either very sharp or very deep in his favorite sentence, his authorship of which he directed should be recorded on his tomb, 'Disputandi pruritus ecclesiarum scabies' ('The itch of disputation is the scab of the churches').

WOTTON, WILLIAM, D.D., chiefly remarkable as an instance of strength of memory, and early progress in acquirements which are dependent upon that faculty, was born 13th of August, 1666, at Wrentham in Suffolk, of which parish his father, the Rev. Henry Wotton, was rector. When a mere child he showed an extraordinary faculty for learning languages; and by the time he was five years of age he had, under the tuition of his father, who was a good scholar, attained considerable facility in reading and translating Latin, Greek, and Hebrew. Sir Philip Skippon, who knew him, in a letter written about this time to Ray, the naturalist, says, "He is not yet able to parse my language, but what he performs in turning the three learned tongues into English is done by strength of memory: so that he is ready to mistake when some words of different signification have near the same sound. His father hath taught him by no rules, but only uses the child's memory in remembering words: some other children of his age seem to have as good a facility in quick apprehension." In April 1676, some months before he was ten years old, he was admitted of Catherine Hall, Cambridge, where he made rapid progress, not only in the languages, adding the Chaldaic, Syriac, and Arabic to the Latin, Greek, and Hebrew, but also, it is asserted, in logic, philosophy, mathematics, chronology, and history. In 1679 he took his degree of B.A.; and in the winter following he became the subject of general attention and wonder by being brought up to London on the invitation of Dr. Gilbert Burnet, then preacher at the Rolls, and introduced by him to all his learned acquaintances. Among other persons, he was in this way made known to Dr. William Lloyd, bishop of St. Asaph, who was so highly pleased with a feat of memory which Wotton performed, repeating verbatim a sermon preached by the bishop, that he took him down with him to St. Asaph, and kept him there for the summer, employing him in drawing up a catalogue of his library. He then returned to Cambridge, where, by the interest of Dr. Turner, bishop of Ely, he obtained a fellowship in St. John's, and where he took his degree of M.A. in 1683. In 1691 he commenced B.D.; the same year Bishop Lloyd gave him the sinecure living of Llandrillo in Denbighshire; and he was soon after made chaplain to the Earl of Nottingham, then secretary of state, who, in 1693, presented him to the rectory of Middleton Keynes in Buckinghamshire.

In 1694 Wotton published his first and best remembered work, his 'Reflections on Antient and Modern Learning,' which is a defence of the superiority of the ancients, in answer to Sir William Temple, who had shortly before, in one of his Essays, taken up the opposite side of the question, in arguing against Perrault's 'Parallèle des Anciens et Modernes,' which had appeared at Paris in 1687. Wotton's performance is famous both for having called forth from Swift his 'Battle of the Books,' in aid of his friend Temple, and as having also originated the great controversy about the so-called 'Epistles of Phalaris:' the authenticity of the 'Epistles,' which had been assumed by Temple, was disputed by Wotton; and it was in an appendix to the second edition of the 'Reflections,' which appeared in 1697, that Bentley published the first draught of his celebrated 'Dissertation,' demonstrating the spuriousness of the 'Epistles,' with a special reference to the edition of them brought out by the Hon. Charles Boyle in 1695. Wotton was distinguished for extent and variety rather than accuracy or profoundness of learning, and his judgment was of no remarkable power; the inherent value of the 'Reflections,' accordingly, is not considerable. Nor of many other books which he afterwards published is there any thing now held in esteem, with the exception perhaps of his 'View of Hickes's Antiquological Treasure of the Antient Northern Languages,' which was partly drawn up by Hickes himself, and was published in 1703, and of which a second edition appeared in 1735. His edition of the ancient Welsh laws, with a Latin translation, which appeared in a folio volume in 1730, after his death, under the title of 'Cyvreithjeu Hywel Dda, ac eraill; ceu, Leges Wallicæ Ecclesiasticæ et Civiles Hoeli Boni et aliorum Walliæ principum,' has been lately superseded by the much more accurate and comprehensive publication of the Record Commission, 'The Antient Laws and Institutes of Wales' (edited by Aneurin Owen, Esq.), folio, London, 1841. Wotton acquired such a command of the Welsh language as to be able to preach in it. In 1707 he was made a D.D. by Archbishop Tenison. He died at Buxted in Essex, on the 13th of February 1726, in his sixtieth year. His easy temper and inattention to economy reduced him to great difficulties in the latter part of his life. He left a daughter, who became the wife of the Rev. William Clarke, canon-residentiary of Chichester.

WOULFE, PETER, a chemist, who lived chiefly in London, and died in 1806. So little is known of his history, that even the place of his birth does not appear have been recorded. He was a Fellow of the Royal Society, and contributed four papers to its 'Transactions,' the titles of which are—1, 'Experiments on the Distillation of Acids, Volatile Alkalies, &c.; showing how they may be condensed without loss, and how thereby we may avoid dangerous and disagreeable fumes;' 2, 'Experiments to show the nature of Aurum Mosaicum;' 3, 'Experiments on a new colouring substance, from the Island of Amsterdam in the South Seas;' 4, 'Experiments on some Mineral Substances.'

The apparatus described in the first of these papers has saved the name of its inventor from oblivion, and yet the arrangement appears to have been first devised by Glauber, though probably unknown to Woulfe, and a representation of it is given at the end of the preface to Glauber's works (folio, 1689).

WOUVERMAN, PHILIP, one of the most popular of the Dutch painters, was born at Haarlem in 1620, and received his first instructions in his art from his father, Paul Wouverman, an obscure historical painter. He was instructed also by John Wyants of Haarlem, and by Frank Hals, who was quite original, and owed little at all to the works of his instructors. Wouverman lived always at Haarlem, and he is generally considered and reported to have been one of those unfortunate painters who depended entirely upon the liberality of picture-dealers, and to have made his patrons rich while he lived in poverty. This does not however agree with the account of Houbraken, who states that Wouverman's pictures rose immensely in value after his death, but that he was nevertheless a fortunate painter; and, in corroboration of the latter part of this assertion, he states that he gave his daughter 20,000 florins (1670,) upon her marriage with the painter of flowers and still life, Hendrik de Fromantjou; but he gives this upon no better authority than private information. D'Argenville states, on the contrary, that Wouverman was occasionally in great want, that he had much difficulty in supporting a large family, and that all we can be no truth in Houbraken's report that he gave his daughter 20,000 florins dowry.

Wouverman died on the 19th May, 1668, and he was so disgusted with his want of success as a painter, that he burned, shortly before his death, all the studies he had made during his life, for fear that a son who had a disposition for painting should be induced by the facilities they might offer to follow the same profession. This son afterwards entered the order of the Carthusians. Another and a less charitable reason assigned for this destruction is, that he feared they might fall into the hands of his brother Pieter Wouverman, who painted similar subjects with himself; a third account is, that the designs and studies which he burned were not his own, but principally Pieter Laer's, and that he destroyed them that it might not be known how much he had made use of the labours of others. None of these stories may be true, but they at least show that Wouverman, like many other men of genius, had his foes as well as his friends. Wouverman must unquestionably be reckoned in his particular style among the most masterly of painters that ever lived. His subjects, though always treated in the same manner, present considerable variety both of scene and action, yet he seldom if ever chose a subject which did not admit of the introduction of one or more horses, animals which he painted with unrivalled skill in his small size. It is a common notion that he never painted a picture without introducing a white or a grey horse into it, and that he very often introduced such a horse is certainly true. His subjects are generally travelling, road-side, hunting, fighting

Digitized by Google

or plundering scenes; and in skies, in foliage, and in the foregrounds, both in composition and colouring, which is always remarkably transparent, he leaves nothing to be wished for, and has had few rivals, and perhaps no superiors, in the same style of works. His figures also, of which he was by no means sparing, are always admirably designed and coloured, and most appropriately introduced; they are also distinguished by the same rich transparency of colouring which characterises the landscape part of his pictures.

Wouvermans's pictures are very valuable, and, notwithstanding his short life, are very numerous: one or more specimens are in almost every good collection in the northern parts of Europe: our own National Gallery does not however possess one of his pictures. His brother Peter's pictures are often attributed to him, but though very similar to Philip's, they are less transparent in colouring, and their horses are very inferior. He had another brother, John, who was a good landscape-painter. John died in 1666, and Peter in 1683.

WRANGEL, CARL GUSTAF, son of the Swedish general Hermann Wrangel, governor of Livonia, who died December 10, 1644, and more eminent than his father as a military commander, was born at Skokloster on Lake Malarn, December 13, 1613. Sent abroad at an early age to acquire foreign languages, he passed a whole year in Holland, where he gained considerable insight into nautical matters and ship-building, which afterwards availed him in his capacity of admiral. Being taken into the service of Gustavus Adolphus, he was at the battle of Lützen (November 1632) and was foremost among those who helped to secure the victory over the Imperialists, after the fall of that prince. From that period his rise was rapid, and he distinguished himself on many important occasions, first under Banier, then under Torstenson, the latter of whom despatched him (1644) to the rescue of the Swedish admiral Clas Flemming, who was blockaded by the Danish fleet, after a severe engagement with them. Flemming, being mortally wounded, gave the command of the Swedish fleet to Wrangel, who conducted it in safety to Stockholm. He afterwards joined the Dutch, and obtained a complete naval victory over the Danes at Femern, made himself master of Bornholm, and would have taken possession of all their other islands, had not the treaty of Bremsebro put a stop to hostilities. He was about this time that he succeeded Torstenson, then disabled by his age and infirmities, in the command of the Swedish army in Germany, where he distinguished himself by a series of successes till they were terminated by the peace of Westphalia. These services obtained for him both honours and rewards: and when Christina's successor, Charles Gustavus, undertook the expedition against Poland, he gave the command of the fleet to Wrangel, who blockaded Danzig. After that he signalised himself against the Danes, made a descent upon Jutland, and took the fortress of Fredrikstadt (1657), which added to the Swedes a decided advantage, and obtained for himself the dignity of high admiral. He next took the castle of Cronenborg, after a siege of three weeks. In the same year (1658) he obtained a victory over the Dutch admiral Opdam, who had come to the assistance of the Danes, and took some of the Danish islands. On the peace of 1660 he was raised to the dignity of grand-marshal of Sweden, and generalissimo, and also appointed by Charles Gustavus one of the guardians to his son Charles XI. In 1675 he undertook the command of the Swedish troops in Pomerania, but was then so disabled by age and infirmities, that he could do very little personally, being the greater part of the time confined to his bed, and was therefore at some distance from the army during its reverses at Havelberg and Fehrbellin, in the June of that year. He accordingly retired to his estate in the isle of Rügen, where he was residing when an alarm being given of the approach of some enemy's vessels, he could not be prevented from proceeding to the spot to a certain the danger. His exertion upon that occasion cost him his life, for it proved too much for his bodily strength, and he died in consequence of it, in July 1676, leaving the reputation of one of the bravest and most skilful commanders, both by sea and land, that Sweden had ever possessed.

* WRANGEL, FERDINAND PETROVICH VON, a distinguished Arctic navigator, is descended from an old Esthonian family, and was born in that province about 1795. He was educated at the academy for naval cadets at St. Petersburg, and in 1817 served as midshipman under Captain Golovnin in his voyage round the world in the sloop Kamschatka. The talent and activity he then manifested recommended him two years after to the command of a surveying and exploring expedition to the Russian Polar seas, in which he was engaged from 1820 to 1824. An opinion had gained ground, founded on rumours prevalent among the natives at Indigirka and Kolyma, that a large tract of land existed to the north of the Polar Sea. The great feature of Von Wrangel's voyage and two expeditions in search of this land made by him on the polar ice, with equal daring and sagacity, in sledges drawn by dogs. His first journey commenced in March 1822, lasted forty-six days, and brought him as far north as two minutes above the seventy-second degree without discovering land. On the second, in February 1823, he was compelled to return also without success from a point at 70° 51′ north, and 175° 27′ east. The Russians remark that his exertions on this occasion placed him on a level with Parry, the Rosses, and Franklin, and an account of the expedition, translated by Mrs. Sabine from the German of Engelhardt, is accompanied with a preface by her husband, himself familiar with Arctic perils, in which he speaks in the highest terms of the labours of the Russian navigator. The account by Engelhardt, drawn up from Von Wrangel's journals, and the English translation of it, published in 1840, had both appeared and attracted general attention before any Russian narrative of the expedition was given to the public. The omission was repaired in 1841, by the appearance of Von Wrangel's own narrative, 'Puteshestvie po severnuim beregam Sibiri i po ledovitomu Moryu' (Journey on the northern coasts of Siberia and the Icy Sea), 2 vols., with a supplement, which, in 1843, was translated into French by Prince Emmanuel Galitzin, while in 1844 Sabine's translation of Engelhardt ran to a second edition. This delay in publication arose from the appointment of Von Wrangel in 1825 to the command of a voyage round the world in the ship Krotky, which occupied him till 1827, and on his return to Archangel, he could not yet been made public. Soon after his return he was appointed governor of the Russian possessions on the north-west coast of America, for which he set out in 1829, accompanied by his wife, by the eastern route through Siberia and Kamschatka. After remaining in command for five years, he returned to Russia by the Isthmus of Panama and the United States, and his first published book was an account of this last journey, 'Ocherk Puti iz Sitki v S. Peterburg' (Sketch of a Journey from Sitka to St. Petersburg), St. Petersburg, 1836. His 'Statistical and Ethnographical Notices on the Russian possessions in America,' were printed in German in 1839 in Baer and Helmersen's 'Beitrage zur Kenntnies des Russischen Reiches.' One of the principal features of his government of these inclement regions was his endeavour to promote the cultivation of potatoes. After his return home he was promoted to the rank of admiral, and appointed head of the ship-timber department in the Russian marine, but in 1849 retired from the government service, and has since been a director of the privileged company for trading with Russian America.

WRAXALL, SIR NATHANIEL WILLIAM, BART., was born at Bristol on the 6th of April 1751. His father was a merchant, and after having received a suitable education in his native town, he entered the civil service of the East India Company, and proceeded to Bombay in 1769. In 1771 he accompanied the expeditions against Gurrah and Baroda as judge advocate and paymaster, and in 1772 he quitted India, and, returning to Europe, landed at Lisbon, where he remained some time, and then occupied himself during the next seven years in travelling over the Continent, most parts of which he visited, from Portugal and Italy to Lapland. For a part of this period however, viz. 1775-76, he was employed as he himself states, in a confidential mission from the Queen of Denmark, Caroline Matilda, then residing at Zell, to her brother, George III. The subject of his mission, he asserts, was very interesting, and that he was acquainted with the contents of the despatches with which he was entrusted; that the king, through Lord Suffolk, presented him with 1000 guineas for his services, but vaunts of his fidelity in not making the nature of them public. In 1775 he published his first work, 'Cursory Remarks made in a Tour through some of the Northern Parts of Europe, particularly through Copenhagen, Stockholm, and Petersburgh,' and its light anecdotal gossipy style carried it rapidly through several editions. In 1777 he essayed history: 'Memoirs of the Kings of France of the House of Valois, interspersed with interesting anecdotes, to which is added a Tour through the Western, Southern, and Interior Provinces of France, in a series of Letters.' It is a work of little value, either as a history or a tour; but the Tour was translated into French in 1784, and in 1785 a new edition was published, enlarged, with dates supplied to the events of the 'Memoirs,' that title having changed to 'History.' In 1780 he became a member of parliament, at first as the supporter of Lord North; but voting against the India Bill in 1783, he afterwards was an adherent of Pitt. During his continuance in parliament he published nothing; but in 1795 he issued, in 3 vols. 4to, 'The History of France from the Accession of Henry the Third to the Death of Lewis the Fourteenth, illustrated by a View of the Civil, Military, and Political State of Europe between the middle and the close of the Sixteenth Century,' which reached a second edition in 1814, and received the approbation of Professor Smyth in his Cambridge lectures. In 1796 appeared what he called a translation of a correspondence between a traveller and a minister of state, of which the 'Monthly Review' at the time asserted that the letters were genuine, but no dependence can be placed on them. In 1799 he published 'Memoirs of the Courts of Berlin, Dresden, Warsaw, and Vienna,' in which are a number of anecdotes that he probably received on no sufficient authority. But his credulity and meanness of judgment were most conspicuously displayed in his 'Historical Memoirs of my own Time: part the first from 1772 to 1780; part the second from January 1781 to March 1782; part the third from March 1782 to March 1784,' in 3 vols. 8vo, published in 1815. Soon after the appearance of the work an action for libel was brought against him by Count Woronsow, the Russian ambassador, who had been accused of being privy to the making away with the wife of the Crown Prince of Würtemberg. He was found guilty, sentenced to pay a fine of 500l., and to suffer six months' imprisonment, which punishment was however remitted after an imprisonment of about three months. The 'Edinburgh Review,' the 'Quarterly Review,' and the 'British Critic' also made violent attacks on the integrity of his representations, against which Wraxall made a very unsuccessful

Digitized by Google

defence in two pamphlets. Still, though no doubt he is to be mistrusted where he does not rest upon authority, he had mixed so much in society, was so inquisitive, and to the best of his abilities observant, that he could not fail to bring together a mass of curious and sometimes important matter. In 1813 he had been created a baronet, and after the revision of the second edition of the 'Memoirs' in 1816 he published no more; but after his death there appeared in 1836, in 3 vols., 'Posthumous Memoirs of his own Time.' They include anecdotes of the most distinguished political and other personages in the latter part of the reign of George III., coming down however only to the year 1789, and resemble the previous volumes, in that the matter is mixed somewhat perhaps by a remembrance of his punishment: a repetition of which, he says in an introduction dated in 1825, he was determined to avoid, though he felt such a result would be no unlikely consequence if they appeared during his life. He died at Dover, on the 7th of November 1831, while on a journey to Naples.

WRAY, ROBERT BATEMAN, an engraver of gems, was a son of the Rev. William Wray, rector of Newtontony in Wiltshire, and afterwards vicar of Broadchalk in the same county, where Robert Bateman Wray was born on the 16th of March 1715. Both on the father's and the mother's side he was allied to some of the best families in the county. On the death of the Rev. William Wray, which happened in 1724, the widow and her young family went to reside at Pottern in Wiltshire, where her brothers Edward and Thomas Byng then lived. Edward was a portrait-painter, had been a pupil and the assistant and an assistant of Sir Godfrey Kneller, with whom he continued to reside till the death of that artist in 1723. Sir Godfrey showed his confidence in Byng's abilities by having directed in his will that the portraits which his sitters had contracted for should be finished by Byng.

During the years occupied in his education Wray learnt, under the tuition of his uncle Edward, to draw the human figure with grace and precision, and acquired such a taste for the fine arts, that when it became necessary for him to make choice of a profession he selected that of seal-engraving, an art which at that time was scarcely advanced beyond the delineation of heraldic figures, and was open therefore to great improvement, offering some encouragement to his ambition, as well as the promise of an honourable maintenance. To learn the mechanical part of the business he was put under a seal-engraver named Gosset, residing in Berwick-street, Soho, where his rapid progress excited a degree of jealousy that led to a speedy dissolution of the connection. Although Mr. Wray began by engraving the types of ancient heraldry as sculptured on the tombs and seals of the middle ages, his innate taste, fostered by the works of the painters whom he met at his uncle's house, and stimulated by a contemplation of the works of the ancients, soon prompted him to a nobler field of exertion, and to endeavour to imitate, if he could not rival, the productions of the Greek masters. This, whilst he continued to prosecute, or at least to give the finishing touches to the common works required by his employers, his choicer hours were devoted to the delineation of nature, and especially of the human figure, until he had succeeded in representing some of the most distinguished personages of English history, or remains of ancient sculpture, or the ideal designs of modern contemporary artists.

Before Mr. Wray had completed his twenty-fourth year he had executed the front face and one of the profiles of Milton, and in another the second profile. Mr. Vasie, of Soho-square, who had recently invented a method of copying ancient engraved gems, was so much impressed with the merits of Mr. Wray's works of the same kind, that he sold copies of them together with those of his own collection. Mr. Wray's name thus became extensively known, and his original productions were sought after with avidity even in Italy. At a subsequent period, when Henry, eighth Lord Arundel, visited Rome to collect works of art for the purpose of decorating his new mansion of Wardour, he was surprised to hear of the fame of a man who was then residing within a few miles of his own gates in England; for in 1759, after a residence of more than thirty years in London, circumstances had induced Mr. Wray to quit the metropolis, and to fix himself at a house in Church-street, Salisbury. To an artist of the celebrity which he had now acquired, locality of abode was of little moment.

It was at Salisbury that he produced some of his best works, and those on which his reputation with posterity will chiefly depend. The difficulty of engraving figures on hard stones in the manner of the ancient Greeks is shown by its rarity in modern times; and although it has been cultivated in Italy with great success, in England Wray has scarcely had a rival. If some of the Italians have surpassed him in facility of execution, and in the number of their works, none have been his superiors in expressing the affections, and in female grace and beauty. That Wray never acquired more than a decent competence by his talents will be easily imagined, when it is stated that the head of the dying Cleopatra, which he esteemed the most perfect, as it was the most difficult of his works, was sold to the Duke of Northumberland for 20*l.* But in no branch of art were the labours of native artists very liberally rewarded in those times, except in some rare instances.

The following are the most remarkable of Mr. Wray's works, and they are here placed in the order in which their merit is supposed by some competent judges to rank:—1, Dying Cleopatra; 2, Medusa's Head, a copy from the Strozzi Medusa; 3, a Magdalen; 4, Flora; 5, Madonna; 6, ideal female head; 7, ditto; 8, ditto; 9, Milton, front face; 10, Milton, profile; 11, ditto; 12, Cicero; 13, Pope; 14, Shakspere; 15, Zingara; 16, Antinous.

Mr. Wray died at Salisbury in the year 1770, in the sixty-fifth year of his age.

WREDE, KARL PHILIP, PRINCE, a field-marshal in the Bavarian service, and designated by Napoleon I. as one of the ablest generals of his time, was born at Heidelberg, on the 29th of April 1767. Having received a good education, in which law and the valuation of forest lands made part of his studies, he was appointed assessor to the High Court of Heidelberg, in 1792. The war between France and Austria having broken out soon after, he was chosen by Prince Hohenlohe as civil commissioner for the palatinate, in the Austrian army. For several years he continued to discharge his commissariat functions in the different German armies, but he had likewise taken part in the military operations, as early as the age of twenty-six; and he had, in 1795, risen to the rank of colonel. During the campaign of 1799, under the auspices of the Archduke Charles, he raised a corps of volunteers among his own countrymen, which he brought to the main army on the 14th of October, along with two Austrian divisions. Placed at the head of one of these regiments, he distinguished himself by repeated acts of daring during the campaigns of 1799 and 1800, and in the latter year, his conduct in the battle of Hohenlinden (December 3), when he covered the retreat of the Austrian troops, acquired him the rank of major-general. In 1804, the commander-in-chief of the Bavarian auxiliaries, General Deroy, having been compelled by his wounds to relinquish his post, it was conferred for the rest of the campaign upon Wrede, who had just been made lieutenant-general; from which period his reputation as a brave and skilful general rose continually.

The great campaign of 1805 furnished him with signal opportunities of obtaining new honours; but no longer in the same service. The policy of Napoleon had succeeded in detaching Bavaria from the interests of Austria, and the contingent supplied by the king, amounting to 25,000 men, formed the 10th corps of that powerful army, which for its numbers, its equipment and its discipline, was perhaps the most formidable France had ever collected. For the first time, it was called the 'grande armée:' eight of the corps were commanded by eight marshals of France; the host mustered 250,000 combatants. This great army having reached the banks of the Rhine between the 17th and 22nd of September 1805, General Wrede joined with Bernadotte, and the united troops passed through the Tyrolese territory, and on the 7th of October, crossed the Danube. On the 13th of October, General Wrede led the French vanguard at the battle of Memmingen, pursued the retreating enemy for several miles off the field, and captured about 1500 Austrians. In 1806, the grand cross of the legion of honour was conferred on him. He was present, the following year, at the siege of Dantzig, which lasted from March 20th to May 27th, 1807. For several months during the campaigns of 1808, General Wrede was detached from the main army, and sent to support the authority of the French empire in the Tyrol. In 1809, under the Prince Royal of Bavaria, he was ordered to take charge of a division of the army, stationed in front of the capital for its defence. Here he attacked the enemy several times, and carried two of their best positions. At the battle of Abensberg, April 20th, 1809, Napoleon commanded the Bavarian troops in person, when they took eight standards, 12 guns, and 1800 prisoners. The following day, General Wrede marched on the Inn, in pursuit of the fugitives, and having overtaken the Austrian rear-guard at Laufen, on the 27th, defeated them a second time, with the loss of all their baggage. Two days later, on the 29th, he repulsed the enemy from the position they had taken up in front of Salsburg, after a most obstinate resistance.

Wrede had already taken rank by the side of the best generals in the French armies, when his dashing exploit, the capture of Innspruck, and his opportune arrival and resolute behaviour at the battle of Wagram, July 6th, 1809, in which he was wounded, procured him the grade of field-marshal, from the Bavarian government, and the title of count from that of France. The years 1810 and 1811 (hostilities being at that time suspended between France and the German States), were spent by the marshal in the peaceful enjoyment of domestic intercourse. About this juncture however he was incited to maintain the honour of his countrymen in a private matter, which provoked much contemporary scandal on the continent. A packet of official letters having been seized in the bags of a Swedish courier immediately published by Napoleon's directions, some of the despatches were found to contain reflections adverse to the conduct of the Bavarian army. These despatches bearing the signature of Count de Duber, the Swedish chargé d'affaires, that nobleman was challenged by Wrede, and a duel fought between them, but without personal injury to either.

Throughout the arduous campaign of 1812, when Napoleon invaded Russia, Marshal Wrede commanded the Bavarian cavalry, dividing with General Deroy the lead of the auxiliary force of that nation, and his name frequently recurs in the French bulletins. At the battle of Polotak, August 22, though eventually defeated by Wittgenstein, his energy was conspicuous, and his companion in arms, Deroy, having

Digitized by Google

fallen during the action, the chief command devolved upon Marshal Wrede. During the retreat he was frequently seen in the rear of the French army, assisting Marshal Ney in covering the fugitive legions. In that terrible retreat Wrede's corps was one of the most severely visited; "the lean wreck of his cavalry was dismounted, and scarcely a single Bavarian horse passed out of the Russian snows." Wrede was destined soon to find himself once more opposed to the general under whom he thus served and suffered, and once more allied to the army in fighting against which his chief honours had been gained. On the 8th of October 1813, the treaty of Ried, by which Bavaria disengaged herself from the Confederation of the Rhine, having been signed, Marshal Wrede, with the appointment of commander-in-chief, marched into Franconia, at the head of a strong Austro-Bavarian force.

After twenty years' uninterrupted service in France, Italy, Germany, and Russia, Wrede now for the first time saw himself placed in the independent command of a separate army. His instructions were to throw himself across the route of Napoleon, then in full retreat after his discomfiture at the battle of Leipsic. This was the chief incident in his career; it is one of the most memorable and instructive in the career of Napoleon. The Austro-Bavarian army consisted of five divisions of infantry and two divisions of cavalry, the number of troops amounting to 56,000, with 160 guns. With this army, on the 30th of October 1813, he posted himself in the forest of Hanau, drawing his troops right across the main road; thereby blocking up the passage for the army of Napoleon, and shutting them out of the French territory near at hand. The army of Napoleon did not exceed 80,000, when it came up to the Main after the fearful slaughter at Leipsic; of these 30,000 were unarmed men; so that to clear his way the French emperor could not rely upon more than 50,000 combatants. His artillery, from 800 pieces had been reduced to 200 guns. The battle of Hanau, in which Marshal Wrede had the honour to measure swords with Napoleon himself, continued for several hours, during which, notwithstanding the disparity of force, the victor and the vanquished they were unable to force their way through the narrow opening between the forest and the banks of the Kinzig. At length Napoleon ordered the artillery of the Guard, under Drouot, and the cavalry of the Guard, led by Nansouti, to force a passage. This manœuvre proved successful, the allies fled towards the river, leaving the road to Frankfurt open to the French. Wrede withdrew the shattered remains of his army behind the Kinzig, under the protection of the cannon of Hanau. The army of Napoleon passed on. The town of Hanau was taken by Marmont on the 31st of October, and retaken by Wrede the following day. But this time, whilst pursuing the Italian rearguard towards the Kinzig he was wounded severely, and obliged to relinquish his command. The loss of the allies at the battle of Hanau amounted to 10,000 men; that of the French to 7000.

As soon as the campaign of 1814 had opened, Marshal Wrede, though scarcely convalescent, resumed the command of the Bavarian corps, and entered France between Basel and Strasbourg, pouring his battalions into the adjacent districts of Lorraine and Franche-Comté. In the campaign of 1814, comprising fourteen pitched battles fought by Napoleon in person, in the space of two months, Marshal Wrede was continually in action. At the battle of La Rothière, February 1, 1814, Marshal Wrede drove the French out of the village of La Gibrère, and then carried Chaumouil and Chevrilliers. The next day, encountering Marmont, who was defiling with his corps over the bridge of Lesmont, he defeated him with great loss. On the 14th of February he marched upon Troyes, the capital of Champagne, and there fixed his head-quarters. On the 27th, he defeated Marshal Oudinot at Bar-sur-Aube. By his impetuous assault and storming of the bridge over the Barse, he greatly contributed to the victory of La Guillotière. Finally he took part at the battle of Arcis-sur-Aube on the 21st of March 1814; and he was one of the most eager advocates of the immediate advance upon Paris.

After the evacuation of France, Marshal Wrede was raised to the rank of prince, receiving in addition the estate of Ellingen in Franconia, from his own sovereign, besides many marks of distinction from various other quarters. The prince was one of the diplomatists selected to meet at the congress of Vienna, where he gave proofs of singular ability. When the escape of Napoleon, in February 1815, revived the war for a few months, Wrede penetrated into Lorraine at the head of the Bavarian army, crossed the Sarre on the 23rd of June, and took military occupation of the west of the midland departments of France. Subsequently, his sovereign entrusted him with several missions of the highest importance, and on the 1st of October 1822 created him generalissimo of the Bavarian armies. When distrubances began to spread through the Rhenish Bavaria in 1832, he was despatched with ample powers to the seat of the insurrection, as chief commissioner; where his conciliatory measures pacified the inhabitants without recourse being had to violence.

Marshal Wrede died at his estate of Ellingen, on the 12th of December 1838, aged seventy-one. His son, CHARLES THEODORE WREDE, the inheritor of his title and domains, born on the 8th of January 1797, is generally considered as one of the most earnest defenders of constitutional liberty in his native land.

WREN, SIR CHRISTOPHER, born at East Knoyle, Wilts, October 20, 1632, was of good family, being the son of Dr. Christopher Wren, chaplain in ordinary to Charles I., and dean of Windsor; and nephew to Dr. Matthew Wren, successively bishop of Hereford, Norwich, and Ely; and from the former of these he seems to have inherited a taste for scientific and literary studies, that of architecture included. That he was initiated into architecture by parental example is highly probable, since he was not educated professionally to the practice of it, but applied himself to it only theoretically, and might never have distinguished himself in it if peculiar circumstances had not led to the exercise of his talents.

Though in his childhood of weak bodily constitution, Wren was of most precocious mind, and that too as youthful genius most rarely displays itself—not in poetic fancy and feeling, but in the abstruser paths of science and philosophy. In fact the almost parrakes of the marvellous when we are told that at the age of thirteen he invented an astronomical instrument, a pneumatic engine, and another instrument of use in gnomonics. These inventions probably served no other end than that of causing him to be regarded as a prodigy; and the fame thus acquired no doubt helped to procure for him at Oxford, where he was entered as gentleman commoner at Wadham College in his fourteenth year, the notice of Dr. Wilkins and Seth Wood, Savilian professor of astronomy. A philosopher and mathematician of the age of sixteen was a phenomenon; and even before then he had been distinguished by his proficiency in anatomy, and had been employed by Sir Charles Scarborough as his demonstrating assistant. While at Oxford he associated with Hooke (whom he assisted in his 'Micrographia') and other scientific men, whose meetings laid the foundation of the future Royal Society. In 1653 he was elected a Fellow of All Souls' College, Oxford.

By the time he was twenty-four he was known to the learned of Europe by his various theories, inventions, and improvements. In August 1657, he was appointed to the professor's chair of astronomy at Gresham College, London, and three years after to that of the Savilian professor at Oxford, when he resigned the Gresham chair. On the establishment of the Royal Society soon after the Restoration, Wren contributed not a little to the reputation of that body. Thus far therefore he had attained to high eminence among his contemporaries, but it was such that he might have remained long early to a few, whereas at present his celebrity as an architect has swallowed up all his other titles to distinction. At that time his architectural genius had hardly dawned, and it was probably chiefly owing to his general reputation for scientific skill that he was appointed by Charles II., in 1661, surveyor of the royal buildings, the surveyor-general, and was commissioned in 1663 to survey and report upon St. Paul's Cathedral, with a view to its restoration, or rather the entire rebuilding of the body of the fabric so as to reconcile it with the Corinthian colonnade added to it by Jones. This scheme met with considerable opposition both from the clergy and the citizens, there being strong prejudices amongst the latter against destroying the old edifice; at least earnest wishes that the tower should be still preserved. Dissensions and protracted discussions, and delay of course, were the consequences, and nothing was done. But if this undertaking remained likely to be postponed indefinitely, if not to fall to the ground altogether, Wren had in the meantime been employed on some other buildings—the Sheldonian Theatre at Oxford (1664-9). The Library of Trinity College, Cambridge, was not built till 1672. In the same interval, and during the discussion on the subject of St. Paul's, he visited Paris (1665), where the works of the Louvre were then in progress, and he had begun to draw up some observations on the state of architecture in that capital, but he unfortunately never published or completed them.

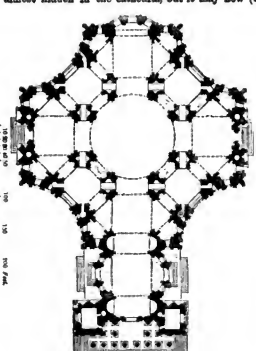
At the beginning of the following year he returned home, but found matters neither settled nor likely to be settled in regard to St. Paul's. At length the events and accidents by which architectural undertakings are so greatly controlled, put an end to all discussion and all perplexity as to retaining any part of the old fabric. Political events had frustrated Jones's plane for the Palace of Whitehall; an event of a different nature, most calamitous in itself at the time, happened opportunely for Wren, since the 'Great Fire' of London not only decided that St. Paul's should be entirely rebuilt as one consistent whole, entirely of his own (the Italian) style, but also gave a field for his talents in various other metropolitan buildings. One immediate labour arising from the conflagration was to make a survey of the whole of the ruins, and a plan for laying out the devastated space in a regular and commodious manner, with wide streets and squares at intervals. Yet so far was this plan from being adopted, that it was lost sight of altogether in rebuilding the city: the new streets rose up in that dense and intricate maze of narrow lanes which are now but slowly disappearing before modern improvements; and worst of all, instead of the line of spacious quays along the Thames, which Wren proposed, the river was entirely shut out from view by wharfs and warehouses in such manner as to render any scheme for improvement to any extent in regard to its banks a matter of extreme difficulty. It is not indeed to be wondered at that amidst such a scene of confusion, and under the pressure of immediate necessity, the citizens should have paid no regard to schemes of architectural magnificence; still it is to be regretted that they did not adopt some general plan, providing for commodiousness in the first instance, and for embellish-

Digitized by Google

ment to grow up afterwards by degrees and under more favourable circumstances.

Thus frustrated in his idea for planning an entire city, and doomed to see his 'New London' among the things that might have been, Wren was compelled to confine his ambition within narrower limits, and to turn his attention towards individual edifices. Among the earliest of these were the Royal Exchange, Custom-house (both since destroyed by fire and rebuilt), Temple Bar, the Monument, and some churches, including that of St. Stephen's, Walbrook; all of which were erected before St. Paul's was begun:—and previous to that great event in his professional life, we may here record two incidents in his private one: in 1672 he received the honour of knighthood; and in 1674 married a daughter of Sir John Coghill, after whose decease he took for his second wife a daughter of Viscount Fitzwilliam, an Irish peer; and by both these ladies he had issue.

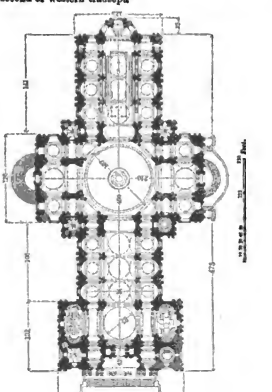
All this time he had not been idle in regard to the intended cathedral, but had prepared various designs and models. The one however which he himself was most solicitous to see adopted was set aside for that now executed; and even there he was compelled to make several alterations contrary to his judgment. Of this last, plans and other architectural drawings are so common that almost any description of it is superfluous, but it is not so with his own favourite project, which, though invariably referred to, has seldom been explained by any drawings; on which account we here exhibit the plan as the clearest and briefest description of it: the original, which has been for so long a period almost hidden in the cathedral, but it may now (1867) be



seen in the South Kensington Museum—though it would seem only for a time, the Dean and Chapter of St. Paul's having only lent it to the government for exhibition temporarily—it had fallen into a very dilapidated condition, but has been thoroughly repaired.

The composition is compact and simple, forming a single general octagonal mass, surmounted by a cupola, and extended on its west side by a portico, and a short nave or vestibule within; and there is also a great deal of play produced by the alternate curved sides of the main body of the edifice. Of this design one great recommendation insisted upon by Wren was that there would be only a single order; yet though this is true as regards existing supercolumniation or order *over* order, there would in fact have been two *ordinances* (both Corinthian), a larger one for the portico or west elevation, and one upon a smaller scale (but raised to the same level of entablature, by being placed on a lofty stylobate) in the side elevations, which would have been surmounted only by an attic and balustrade. Such a combination of two ordinances might perhaps have been objected to by some as rather licentious, notwithstanding that there is ample authority for it in the works of Palladio and others of the Italian school; but it would at all events have produced picturesque variety, and the larger order of the portico would have appeared the more imposing by contrast with the other. It is further to be observed that that ordinance is kept distinct from the other by being confined to a separate elevation of the building. As to the interior, the parts are beautifully grouped together, so as to produce at once both regularity and intricacy, yet it does not seem by any means particularly well adapted for the Protestant service, there being no space for a collected congregation, except in the circular area beneath the dome, which could not be fitted up for such purpose without being further inclosed; whereby also in other respects the grandeur of the ensemble, as is shows itself in the plan, would have been greatly impaired.

The comparison of that first idea with the one afterwards adopted makes evident almost opposite modes of treatment both as to arrangement and proportions. While the first exhibits concentration and uniform spaciousness, the other is more extended as to length, but contracted in other respects, and the diagonal vistas that would have been obtained in the other case are altogether lost. It may be observed too that the nave, or western arm of the cross, is rendered apparently shorter than the eastern one, externally, being broken so as to form a second or western transept.



The first stone of the present edifice was laid June 21, 1675; the choir was opened for divine service in December 1697, and the whole was completed in thirty-five years, the last stone on the summit of the lantern being laid by the architect's son Christopher in 1710. Taken altogether, the present St. Paul's is a truly glorious work—its cupola matchless in beauty; yet all noble as it is, the fabric will not bear to be rigidly scrutinised in the spirit of captious criticism; and of late years no little of such criticism has been brought to bear against it. Among other faults, it is alleged that its real form and construction are masked, the upper order of the side elevations being merely a screen concealing the buttresses and clerestory windows of the nave; also that the same is in a great measure the case with the cupola, the external dome being considerably loftier than the inner one, being so elevated chiefly for effect:—True; and that effect is most admirably accomplished. The last reproach is all the more inconsistent, because it has, if not proceeded from, been repeated by those who, while they censure St. Paul's dome as being larger than the interior actually required, not only tolerate but are in ecstasies with a Gothic spire—a feature built altogether for external effect, and quite useless as regards the interior of the structure, otherwise than as giving stability to the tower. Another charge which has now started up against Wren is that he was either ignorant or grossly negligent of the principles of ecclesiastical design—of 'symbolism,' 'spiritualism,' 'sacramentality,' &c. But Wren simply endeavoured to adapt his churches to Protestant congregations, and so far generally showed considerable skill, but it must be confessed very rarely sufficient taste, or aught amounting to architectural character and style. Of his numerous churches in the city, few have any claims to notice for beauty of design. They are, almost without exception, in a heavy uncouth manner, chiefly marked by a number of large arched and small circular windows, the former of which appear little better than so many dismal gaps glazed in the most ordinary manner. There is nothing in any one of them to remind us of the architect of St. Paul's—nothing in their external design that will bear comparison with such exquisitely beautiful bits in that structure as the two semidircular porticos of its transepts, worthy models for church façades. Even in his campanili—the far-famed steeples of St. Bride's and Bow Church, the general outline is what is chiefly to be admired, for they are compounds of incongruous

Digitized by Google

parts oddly put together, and not particularly elegant in themselves. The interior of St. Stephen's, Walbrook, has also, to our thinking, been greatly overrated.

Without therefore specifying one by one, Wren's other performances, almost all of which serve rather to encumber than to add anything to the glory derived from St. Paul's, we annex a chronological list of them to this article as more convenient for reference, and resume our biographical notice of the architect himself.

One work which would probably have not a little augmented his fame was a design for a magnificent mausoleum to the memory of Charles I.; yet though parliament voted 70,000*l.* for the purpose in 1678, the design was abandoned, and the money applied more conformably with the personal tastes of Charles II. Wren had been thwarted in his ideas for another monument, namely, the column so called, which he had conceived very differently and very characteristically, the shaft being adorned with gilt flames issuing from the loop-holes; but no such pattern was to be found in the 'five orders,' therefore as "the impotence of indecision ever resorts to precedent, and ignorance takes refuge in common-place," that design was set aside for the common-place affair which we now see.

Wren had resigned the office of Savilian Professor in 1673; he accepted that of President of the Royal Society in 1680, and he also sat several times in parliament, but his numerous and important professional engagements left him little leisure for other pursuits or duties. Enjoying the favour of successive princes, he was employed by Queen Mary to complete the buildings at Greenwich, to be appropriated as a Royal Naval Hospital; and Wren's additions to that noble pile are well worthy of the architect of St. Paul's, although, by some strange caprice, less quoted as proofs of his genius than several of his inferior performances. In his additions to Hampton Court for William III. he was less fortunate—perhaps unfortunate in being controlled by the taste of the king. If it is not actually a blot upon his fame, as was his work at Windsor Castle, Hampton Court adds nothing to it, whereas he might perhaps have produced a piece of palatial architecture at Windsor had his plan for erecting a distinct pile of building on the south side of the Upper Ward been adopted. Still palaces do not appear to have been exactly Wren's forte, at least not if we judge by such specimens as he has given us in Marlborough House and some portions of St. James's.

After the death of Anne, the last of his royal patrons, Wren was dispossessed of his office of surveyor-general (which he had held for forty-nine years), very little to the credit of George I., and to the disgrace of "one Benson," the man who, by succeeding him in that capacity, has preserved a name from oblivion by perpetuating it for lasting shame and contempt. To Wren himself however this discharge from office must have been rather a welcome release than otherwise; for, verging towards ninety, he could then have little further worldly ambition, even had he not already amply gratified it. The close of his life was not so much to be pitied as to be envied, for if he passed the last few years of his existence in retirement and in comparative obscurity, he passed them in serenity of mind and placid contentment. The struggles of dissolution were spared him, for without any previous symptoms of approaching death he was found dead, reposing in his chair after dinner, February 25th, 1723, in the ninety-first year of his age.

He received the tardy honour of a splendid funeral in St. Paul's, where his remains were deposited in the crypt, with no other adornment to his tomb than the inscription on it, with the sublimely eloquent legend, "Si Monumentum quæris, circumspice."

Christopher, the architect's son by his first marriage, and who sat in parliament for Windsor about 1718, was author of a work entitled 'Numismatum Antiquorum Sylloge,' 4to, 1708; and he composed the chief part of the 'Parentalia, or Memoirs of the Family of the Wrens,' but left it unfinished at his death (1747); it was completed by Stephen Wren, Sir Christopher's grandson, and published in 1750. This work must be considered rather as a mere register of dates and facts than a biography; for as to the last, it is dry and tedious, yet valuable as an authentic record, and as such it has always been referred to. All Souls' Library at Oxford contains other more interesting records of the great architect's professional studies, in a collection of original drawings by him; and it excites not only regret, but some astonishment also, that these, or at least a selection of the most interesting of them, should never have been published. In fact comparatively few of Wren's buildings have been fully described or described at all by authentic architectural delineations, or otherwise than by mere views. In 1842 however was published a very large and highly-finished engraving exhibiting all the structures erected by him brought together into one extended group. This kind of graphic synopsis was from a composition by Mr. C. R. Cockerell, and is appropriately entitled a 'Tribute to the Memory of Sir Christopher Wren.'

Chronological List.

1663. Pembroke College Chapel, Cambridge.
1664-69. Sheldonian Theatre, Oxford.
1664. Buildings at Trinity College, Cambridge.
1666. Library ditto ditto.
1667. Royal Exchange, London.
1668-77. Emmanuel College Chapel, Cambridge.
1668. Custom House, London.
1670. Temple Bar.
1670-74. St. Sepulchre's, Newgate.
1671-77. The Monument, London (202 feet high).
1671-78. Spire and Church of St. Mary-le-Bow.
1671-86. St. Lawrence, Jewry.
1672-79. St. Stephen's, Walbrook.
1672. St. Michael's, Cornhill.
1672. St. Mary-at-Hill.
1673. St. Bennet Fink, Threadneedle Street, dome now taken down.
1674-98. College of Physicians, Warwick Lane (now converted into a market).
1675. St. Paul's begun.
1675. Royal Observatory, Greenwich.
1680. St. Bride's, Fleet Street.
1680. St. Swithin's.
1681-82. Gateway Tower, Christchurch, Oxford.
1682-96. Chelsea Hospital.
1682. St. Antholine's, Watling Street.
1683. The Palace at Winchester, which was left unfinished, and is now a barracks.
1683. Ashmolean Museum, Oxford.
1683. Queen's College Chapel, Oxford.
1683. St. James's, Westminster.
1683-86. St. Clement's, Eastcheap.
1684. St. Martin's, Ludgate.
1684. Made comptroller of works at Windsor Castle.
1686. St. Andrew's, Holborn.
1687-1704. Christ Church, Newgate.
1690. Hampton Court.
1692. Morden College, Blackheath.
1696. Greenwich Hospital.
1698. St. Dunstan's in the East (tower and spire).
1703. Buckingham House, London (now taken down).
1709. Marlborough House, London.
1713. Westminster Abbey (towers of west front).

WREN, MATTHEW, Bishop of Ely, was the eldest son of Francis Wren, a mercer in London, where he was born in the parish of St. Peter's Cheap, on the 3rd of December 1585. He was admitted of Pembroke Hall, Cambridge, on the 23rd of June 1601, was elected Fellow on the 9th of March 1605, and took his degree of M.A. on the 22nd of July 1608. He entered into holy orders in 1610. In 1614 he was presented with the rectory of Teversham in Cambridgeshire. In 1621 he was appointed chaplain to Prince Charles. He attended the prince in his strange journey into Spain in 1623, and having thus had opportunities possessed by scarcely any other churchman of ascertaining the opinions and feelings of him who was afterwards to be king, he acquired an influence with the clergy which made him one of the main causes of the calamities which soon afterwards overtook them. In 1625 he was made dean of Windsor and Wolverhampton, and in 1629 one of the judges of the Star Chamber. He attended Charles I. on his visit to Scotland in 1633, but he failed to sound the religious feelings of the people of that country so accurately as he had done those of his royal master. In the following year he was made Bishop of Hereford, and translated on the 5th of December 1635 to Norwich, and on the 5th of May 1638 to Ely. He was employed in the construction of the Scottish Service-Book, or Liturgy, the reading of which in Edinburgh in 1637 occasioned those riots which were followed by the subscription of the Covenant, and finally led to the great civil war. On the 19th of December 1640, Matthew Wren was sent by the Commons on a message to the Lords to acquaint them that there were "certain informations of a high nature" against Wren, "concerning the setting up of idolatry and superstition in divers places, and exercising some acts of it in his own person, with divers other matters of great importance; and that they have information likewise that he endeavours an escape." An answer was returned, that he had been ordered to find bail in 10,000*l.* to attend the judgment of parliament. According to a paper preserved in the 'Parentalia' of his nephew, the articles of impeachment included to be presented against him related to such charges as the railing in of the altar, kneeling at the sacrament, and other matters of ceremonial, which afterwards became part of the uniform observance of the Church of England. There is no doubt however that the real ground of the charge against him was the despotic enforcement of his own views in clerical matters; for Clarendon, who praises his learning, says he was a man "of severe sour nature," and charges him with having so vexatiously enforced the discipline of the Church of England against the Flemish refugees and other dissenters, as to drive many of them from his diocese. The articles of impeachment were not pursued, but he remained a prisoner in the Tower till the Restoration of 1660, when he was replaced in his see. He framed the form of prayer used on the 29th of May in commemoration of the Restoration. He died on the 24th of April 1667. His bulk the chapel at Pembroke Hall, Cambridge, of which his nephew Sir Christopher was the architect. Of a few doctrinal and controversial pamphlets which he left behind him, the titles will be found at length in the 'Biographia Britannica.'

WREN, MATTHEW, eldest son of Bishop Wren, was born at Cambridge in 1629. He was for some time a member of parliament. He

Digitized by Google

was also secretary to the Earl of Clarendon, and afterwards to the Duke of York. He died in 1672. Matthew Wren was the author of 'Considerations on Mr. Harrington's Commonwealth of Oceana, restrained to the first Part of the Preliminaries,' 8vo, London, 1757, published anonymously; 'Monarchy asserted, or the State of Monarchical and Popular Government illustrated by Considerations upon Mr. Harrington's Oceana,' 8vo, Oxford, 1659; 8vo, London, 1660; 'On the Origin and Progress of the Revolutions in England,' in Gutch's 'Collectanea Curiosa,' vol. i. 1781.

WRIGHT, EDWARD, a mathematician, the account of whose life and writings is generally so loosely given that it will be worth while to devote a little more space to him than his celebrity would otherwise demand. He was born at Garveston in Norfolk, but the date is not known. He was educated at Caius College, Cambridge, of which he became a fellow. Dr. Hutton (in the preface to his logarithmic) quotes a translation of what he calls "a Latin piece taken out of the annals of Caius College, Cambridge," in which it is stated that Wright had great mechanical knowledge, and was most expert in the making of instruments, that he was the first inventor of the plan of bringing water from Ware to London (in what is now called the New River), but that he was prevented by trickery from bringing his plan into action. It is also stated by Sherburne, who gives some account of him in the list at the end of the translation of Manilius, that Wright was mechanical tutor to Prince Henry, son of James I., and that for this prince he caused to be made the celebrated sphere which not only showed the motions of the solar system, but would suffice to foretell eclipses for 17,100 years. This sphere was damaged in the civil troubles, but was recovered and repaired by Sir Jonas Moore in 1646, and Sherburne, who published in 1675, says that it was then at Sir Jonas Moore's official residence in the Tower. But Wright's fame rests entirely upon his discovery of the mode of constructing the sea-chart which is now in universal use under the name of Mercator's Projection. When sea-charts were first made, the degrees of latitude were made of equal length; but this practice was nothing more than a map in which degrees of latitude and longitude were represented by equal parts throughout. On such a chart attempts were made to navigate by following the course marked out by a line on the map joining the port of departure with that of destination, and the error was considerable. Mercator [Mercator, Gerhard] saw enough of the source of this error to know that the degrees of latitude ought to increase in length; and this might have been easily found out on a common globe, by transferring to the globe the straight line of the common chart, and comparing it with a rumb line approximately traced out. Mercator accordingly constructed rough charts (probably by transferring rumb lines from the globe to the chart, making them straight in the latter), in which the degrees of latitude increase, and in something like the proper manner: but there is not the slightest reason to suppose that he had the least idea of doing more than this, or that he had investigated the mathematical problem of so laying down the sphere on a plane as that the rumb lines should be straightened. But it is absurd, as some writers have done, to assert that Mercator borrowed his idea from Wright, since the maps of the former were published perhaps before the birth of the latter, certainly thirty years before he published anything on navigation. And Wright himself, mentioning Mercator, says, exactly as might have been expected, "By occasion of that mappe of Mercator, I first thought of correcting so many and grosse errors, &c." All that could have been learned by Mercator's hint, Wright did learn: it must first be shown to be likely that the former had a rule before it can be suspected that the latter copied it.

To instruct himself in practical navigation, Wright went to sea in 1589, on a voyage to the Azores, with George, earl of Cumberland, a distinction from residence in college having been granted him by the queen. Navigation had not been long flourishing in Britain: a few years before Wright, many captains "mooked them that used charts or cross-staves, saying they cared nothing for their sheep skinnes, they could keep a better account upon a boord; and them that observed sunne or starres for finding the latitude, they would call sun-shooters and star-shookers, and ask if they had hit it." In this voyage Wright made many observations, and perhaps thought of this method of drawing the chart. Nothing of this however was published until 1594, when Blundevil, in the second edition of his 'Exercises,' gave the mode of constructing the chart and the following account of it:—"Mercator hath, in his universall card or map, made the spaces of the parallels of latitude to be wider every one than another from the equinoctiall towards either of the poles, by what rule I know not, unlesse it be by such a table as my friend Master Wright, of Caius College, in Cambridge, at my request, sent me (I thanke him) not long since, for that purpose, which table, with his cosent, I have here plainely set downe, together with the use thereof." Then follows a rough table for the length of degrees only, and apparently not made from a very accurate table of secants. In 1599 Wright published his 'Certaine Errors in Navigation detected and corrected,' in which he explains at great length the theory of his chart, and gives what he calls his 'table of latitudes,' to minutes, being exactly what has since been called a table of meridional parts. He also treats on the compass and the cross-staff, and gives an account of his solar observations, and a corrected solar theory. In the second edition, published in 1610, he gives a full answer to some objections raised by Stevinus. The third edition is of 1657, edited by Joseph Moxon.

In looking at the manner in which Wright announced and used the remarkable discovery which is permanently connected with his name, and comparing it with the impression derived from the manner in which his successors have frequently presented that discovery, it seems to us as if he had hardly received his due share of credit. He had a full and geometrical power over his subject; nothing but the differential calculus could have given him more. He knew well that the infinitely small increments of the meridian must be inversely as the cosines of the latitudes, and thence formed his celebrated table by the sums of the secants, expressing that it would be made more exact the smaller the interval of the angles of those secants is made. Had those who have written about them studied his work, the "geometrical cords" which he gives for dividing the meridian would have become a common and well-known illustration, and would have appeared in collections of examples, examination papers, &c. We quote it, as showing completely that there was nothing empirical about his table. "Let the meridian roule upon a streight line beginning at the equinoctial, the globe swelling in the meane time in such sort that the semidiameter thereof may be alwaies equal to the secans of the angle, or arch conteined betweene the equinoctial and semidiameter insisting at right angles upon the foresaid streight line: The degrees, minutes, seconds, &c. of the meridia, noted in the streight line, as they come to touch the same, are like unto the divisions of the meridian in the nautical planisphere. And this conceit of the meridian of the nautical planisphere may satisfie the errious exactnes of the geometrician; but for mechanical use, the table before mentioned (which heere now followeth) may suffice." The result of the integral calculus, namely, that the sums of the secants in Wright's table were ultimately proportional to the logarithmic cotangents of the semi-complements of the latitudes, was first announced by Henry Bond in Norwood's 'Epitome' (1645), and more fully in his (Bond's) edition of Gunter, 1653. It was first demonstrated by James Gregory, in his 'Exercitationes Geometricæ,' 1668, and afterwards by Halley. ('Phil. Trans.' 1696: see also 'Miscellanea Curiosa.')

When the invention of logarithms became public, Wright immediately applied himself to the study of the new method, and translated Napier's description of his canon. This translation was finished by Napier at Edinburgh, received his approbation and a few lines of addition, and was returned for publication. But Wright died soon after he received it back (in 1615, as appears by the college manuscript, and therefore not in 1618 nor 1620, nor 1624, as asserted by various authors), and it was published in 1616 by his son, Samuel Wright, also of Caius College, with a dedication to the East India Company, which had for some time allowed the father an annuity of 50*l.*, in consideration of his delivering a yearly lecture on navigation.

Wright left other works in manuscript on the use of the sphere, on dialling, and on navigation, called "the haven-finding art," so says Sherburne. But Wilson, who wrote the history of navigation attached to Robertson's work on that subject, and who is a respectable authority, says that this haven-finding art, which was a translation of Stevinus's 'Portum Investigandorum Libellus,' printed in Latin by Grotius with the above title in 1599, was printed in the same year, in English, by Wright, and was afterwards attached to the third edition of the 'Errors Detected.' There is in the Royal Society's Library an imperfect copy, without date, of one Edward Wright's 'Description and Use of the Sphere,' &c.

WRIGHT, JOSEPH, commonly called 'Wright of Derby,' where he was born in 1734: his father was an attorney of Derby. Wright came to London in 1751, and placed himself with Hudson the portrait-painter, who was the master also of Reynolds and Mortimer. In 1753 he married, and soon afterwards set out for Italy, where he remained, chiefly in Rome, for two years. After his return to England in 1775 he resided two years at Bath; he then settled at Derby, where he remained until his death in 1797. Wright was a painter of great ability; he drew and coloured well, both in figures and landscape. He practised for many years as a portrait-painter, but painted at the same time also a few historical or figure-pieces, in some of which he represented the effect of fire-light, a style of work he always had a taste for, which was much strengthened by a great eruption of Mount Vesuvius which he witnessed during his stay in Italy; and his pictures in this style are the best of any which were produced in his own time in England.

In 1782 he was elected an associate of the Royal Academy, but being offended at Mr. Garvey's being chosen an academician before him, he resigned his diploma in disgust; he continued however occasionally to send his works to the Academy exhibitions. In 1785 he made an exhibition of his own in a large room in the Piazza of Covent Garden, when he exhibited in all twenty-four pictures, among which were several illustrating the effects of fire-light, the best of which was the destruction of the floating batteries off Gibraltar. He in the latter years of his life painted chiefly landscapes; and his last work, a large view of the head of Ullswater in Westmoreland, is spoken of as a picture of great merit. The following pictures are mentioned as Wright's best historical pieces:—'The Dead Soldier,' 'Edwin at the Tomb of his Ancestor,' 'Belshazzar's Feast,' 'Hero and Leander,' the 'Lady in Comus,' and the 'Storm Scene in the Winter's Tale,' painted for Alderman

Digitized by Google

Boydell. Of his landscapes, two of the best were views of Cicero's Villa, and Mæcenas' Villa at Tivoli; he painted also several other beautiful Italian landscapes, which have many of the beauties of Wilson. Of remarkable or peculiar effects of light he painted many popular pieces, as the 'Blacksmith's Forge,' an 'Eruption of Mount Vesuvius,' the 'Hermit,' the 'Indian Widow,' 'Mirwan opening the Tomb of one of his Ancestors,' besides several domestic pieces in which striking effects of candlelight are admirably imitated: he painted also a picture of the Girandola, or the fireworks which are exhibited from the castle of St. Angelo at Rome on the eve of St. Peter's day, and at other festivals of the Roman Church.

When Wright was in Rome he made some drawings from the frescoes of Michel Angelo in the Sistine Chapel, which can be said to have preserved perfectly the character of those great works: he was an enthusiastic admirer of Michel Angelo. Mortimer and Wright were the first painters of recent times who successfully cultivated historical painting in England, or indeed perhaps the first Englishmen who excelled as historical painters. Neither Sir James Thornhill nor Hogarth can be considered as exceptions, for the former was chiefly an allegorist—the latter a satirist; and although both allegory and satire are perfectly compatible with historical painting as it is more strictly understood, they are not necessarily connected, and in these cases they were quite distinct from it.

*WRIGHT, THOMAS, a native of the borders of Wales, but of a good Yorkshire family, was born on the 21st of April 1810. He was educated at Ludlow Grammar School, and at Trinity College, Cambridge, where he graduated B.A. and M.A. While still an undergraduate, he commenced his literary career by writing in 'Fraser's Magazine,' the 'Foreign Quarterly Review,' the 'Gentleman's Magazine,' the 'Literary Gazette,' &c., to some of which he is still an occasional contributor. Eventually he devoted his attention especially to archæological studies, which he pursued with rare zeal and intelligence—not suffering his labours to be frittered away on a crude heap of miscellaneous fragments, but investigating in their principles, as well as minute details, the early English history, literature, popular opinions, and antiquarian remains, in all parts of these subjects. In the Transactions of learned societies, and still more his separate publications, early secured him a high position among the antiquaries and literary men of this country, and a considerable reputation on the Continent.

Mr. Wright was one of the founders of the Camden Society in 1838, of which he was the first honorary secretary. Subsequently he took an active part in the formation of other societies on a similar plan, as the Percy Society, of which he was for some time treasurer and secretary, and the Shakespeare Society. In 1845 he, in conjunction with Mr. Roach Smith, founded the British Archæological Association, and during several years edited its 'Journal;' but in 1849, along with the president (the present Lord Londesborough), and other leading members, he separated himself from it. He is a fellow of the Society of Antiquaries, to whose 'Archæologia' he has been a frequent contributor.

When the death of the Earl of Munster made a vacancy in one of the few places of correspondents to the Académie des Inscriptions in the Institute of France, Mr. Wright was elected to supply it by the largest majority of votes known, it is said, for any of the unoccupied corresponding member who had been elected. His opponents were Mr. W. H. Hamilton (vice-president of the Society of Antiquaries), and Sir Gardner Wilkinson. It added to the honour that the two leading ministers of state (Messrs. Guizot and Thiers), M. Augustin Thierry (though then blind), and several other men of great literary reputation who rarely attended, went specially to vote for Mr. Wright. Many other learned societies of the Continent have also enrolled his name as one of their members, including the Société des Antiquaires de France, the Société Ethnologique de Paris, the Royal Society of Northern Antiquaries of Copenhagen, de Svenska Fornskrift Sällskapet, Stockholm, &c.

The following list of his separate works will sufficiently indicate the range of his studies and show his remarkable industry. Of the value of the works, it will be enough to say that, addressed as many of them are to the learned, they have taken their place, some of them (as the 'Biographia Britannica Literaria') as admitted authorities on the subjects of which they treat, and others as standard editions of their authors:—1836, 4 small vols. of black-letter poetical tracts, edited for Pickering; 1837, 'Guifridi de Monemuta Vita Merlini—Publié d'après les MSS. de Londres,' 8vo, Paris; 1838, 'Queen Elizabeth and her Times,' 2 vols. 8vo; 'Early Mysteries, and other Latin Poems of the 12th and 13th centuries, 8vo; 'Allitarative Poem on the Deposition of Richard II.,' post 4to (Camden Soc.); 1839, 'The Political Songs of England, from the reign of John to that of Edward II.,' post 4to (Camden Soc.); 1840, a new edition, with notes, of Fuller's 'History of Cambridge,' 8vo; 1841, 'Popular Treatises on Science written during the Middle Ages, in Anglo-Saxon, Anglo-Norman, and English,' 8vo; 'Reliquiæ Antiquæ: scraps from ancient MSS., illustrating chiefly early English Literature and the English Languages,' 2 vols. 8vo (edited with Mr. Halliwell); 'The Latin Poems commonly attributed to Walter Mapes,' post 4to (Camden Soc.); 'Political Ballads published in England during the Commonwealth,' post 8vo (Percy Soc.); 'Specimens of Christmas Carols from MS. sources,' post 8vo (Percy Soc.);

1842, 'The Vision and the Creed of Piers Ploughman, with notes and a glossary,' 2 vols. fcp. 8vo; 'A Collection of Latin Stories, illustrative of the History of Fiction during the Middle Ages,' post 8vo (Percy Soc.); 'Specimens of Lyric Poetry composed in England in the reign of Edward I.,' post 8vo (Percy Soc.); 'Gifford's Dialogue concerning Witches,' post 8vo (Percy Soc.); 'The Autobiography of Joseph Lister,' 8vo; 1843, 'Contemporary Narrative of the Proceedings against Dame Alice Kyteler, prosecuted for sorcery in 1324,' post 4to (Camden Soc.); 'Original Letters relating to the Dissolution of Monasteries,' post 4to (Camden Soc.); 'The Owl and the Nightingale, an early English poem attributed to Nicholas de Guildford,' post 8vo (Percy Soc.); 'Early English Miracle Plays,' 2 vols. 8vo (Shakespeare Soc.); 1844, 'St. Patrick's Purgatory: an Essay on the Legends of Hell, Purgatory, and Paradise, current during the Middle Ages,' post 8vo (reprinted in America); 'Anecdota Literaria: a collection of short poems in English, Latin, and French, illustrative of the Literature and History of England in the 13th century, and more especially of the Condition and Manners of the different classes of society,' 8vo; 'St. Brandan: a Medimval Legend of the Sea, in English verse and prose,' post 8vo (Percy Soc.); 1845, 'Memorials of Cambridge,' plates by Le Keux, 2 vols. royal 8vo; 'The Archæological Album, or Museum of National Antiquities,' 4to; 'The Seven Sages: a collection of Stories in Early English verse, from a manuscript at Cambridge, with Introductory Essay on Popular Stories,' post 8vo (Percy Soc.); 1846, 'Essays on the Literature, Popular Superstitions, and History of England in the Middle Ages,' 2 vols. post 8vo; 'Biographia Britannica Literaria,' 8vo vol. iv. 'Anglo-Saxon Period;' vol. v. 'Anglo-Norman Period;' 'The Religious Poems of William de Shoreham, vicar of Chart Sutton in Kent, temp. Edward II.,' post 8vo (Percy Soc.); 1847, 'The Canterbury Tales of Chaucer, a new text with illustrative notes,' 3 vols. post 8vo (Percy Soc.); 'Songs and Carols, from a MS. of the 15th century in a private collection,' post 8vo (Percy Soc.); 1848, 'England under the House of Hanover, illustrated from the Caricatures and Satires of the day,' 2 vols. 8vo; 'Early Travels in Palestine, translated from the Latin, with notes,' 12mo (Bohn's Antiquarian Library); 1850, 'Gualteri Mapes de Nugis Curialium,' 8vo (Camden Soc.); 'Geoffrey Gaimar's Anglo-Norman Metrical Chronicle of the Anglo-Saxon Kings,' 8vo; 1851, 'Narratives of Sorcery and Magic,' 2 vols. 8vo; 1852, 'The Celt, the Roman, and the Saxon: a History of the Early Inhabitants of Britain, illustrated by the ancient remains brought to light by recent research,' post 8vo; 'History of Ludlow and its Neighbourhood, forming a popular sketch of the History of the Welsh Border,' 8vo; 1853, 'The History of Ireland,' 3 thick vols. in imp. 8vo, published in numbers, and completed in 1857; 1854, 'Wanderings of an Antiquary chiefly upon the traces of the Romans in Britain,' fcp. 8vo; 'The Travels of Marco Polo the Venetian,' 12mo (Bohn's Antiq. Lib.); 'Cambridge University Transactions, a collection of contemporary documents relating to proceedings in the University during the Puritan Controversies of the 16th and 17th centuries,' 2 vols. 8vo; 'The Canterbury Tales of Geoffrey Chaucer,' revised edition, in 1 vol. 8vo; 1855, 'The History of Fulke Fitz Warine, an outlawed Baron in the reign of King John, edited from a manuscript preserved in the British Museum, with an English translation,' post 8vo; 'The History of Scotland,' 2 thick vols. 8vo, published in numbers, and completed in 1857; 'Early Christianity in Arabia, an historical essay,' 8vo (written when the author was eighteen years of age); 1856, 'Johannis de Garlandia de Triumphis Ecclesiæ libri octo. A Latin poem of the 13th century,' 4to (Roxburgh Club); 'The Vision and Creed of Piers Ploughman,' revised edition, 2 vols. fcp. 8vo; 'Songs and Carols, from a MS. of the 15th century in the British Museum,' post 8vo; 1857, 'Dictionary of Obsolete and Provincial English,' 2 vols. 12mo (Bohn's Philological Library); and 'Miscellanea Graphica: representations of Ancient, Medimval, and Renaissance remains in the possession of Lord Londesborough; the Historical Introduction by Thomas Wright,' post 4to. He has also completed 'A Volume of Vocabularies, illustrating the Condition and Manners of our Forefathers, &c., from the 10th century to the 15th,' imp. 8vo; and 'Les Cent Nouvelles Nouvelles, publiées d'après le seul manuscrit connu avec Introduction et Notes, par M. Thomas Wright,' 2 vols. 12mo, Paris, both of which are just ready for publication; and he has in progress a 'History of France,' imp. 8vo, which is in course of publication in numbers.

* WRIGHT, THOMAS, whose praiseworthy endeavours to benefit prisoners have earned for him the title of the 'Prison Philanthropist,' was born in 1788. At an early age he went to work at Ormerod and Sons' iron-foundry in Manchester, and continued in the same employment for forty-seven years. His claim to public notice is the fact that for many years he has pursued with unremitting zeal and perseverance various plans for the welfare of criminals, visiting them in prison, endeavouring to induce them to forsake an evil course of life, and adopting measures to obtain employment for such discharged prisoners as seemed desirous of prosecuting a course of honesty. Being foreman in one of the departments of the foundry his wages amounted to 3*l.* 10*s.* per week; of this sum he was accustomed to give 2*l.* to his wife for house expenses, devoting the remaining portion of his wages, and as much of his time as he could spare from his daily duties, on behalf of prisoners, with the view of restoring as many of them to

Digitized by Google

society as possible. In the case of criminals sentenced to death, Mr. Wright has been in the custom of visiting and conversing with them, and imparting to such as would receive it suitable religious instruction. These labours have been extended to prisons in London, and in many places throughout England and Scotland. Mr. Wright has also visited the hulks. Having for many years pursued this course without ostentation, the attention of several influential and benevolent persons was at length drawn to the circumstances, and a subscription amounting to upwards of 3000*l.* was raised in 1852, chiefly in Manchester and Liverpool, and invested, so as to furnish a small yearly income to Mr. Wright, and thus enable him to devote his entire energies to his benevolent pursuits. Since that time he has continued to carry out his long-cherished plans on behalf of criminal outcasts; but, although now sixty-nine years of age, he by no means confines himself to one branch of effort. He has been the means of founding a Reformatory school for boys in Manchester, of which he is a director. He assists in the management of several Ragged schools, and is occasionally engaged on the Sabbath in preaching annual sermons on behalf of local Sunday schools and in aid of different religious bodies in Manchester. His self-denying and useful labours have secured for Mr. Wright the esteem of numerous persons in all parts of the empire.

WRIOTHESLEY, THOMAS, the fourth Earl of Southampton, being the son of the Earl of Southampton who was engaged in Lord Essex's conspiracy in the reign of Elizabeth, and the great-grandson of the first Earl of Southampton, Henry VIII.'s lord chancellor, was one of the most distinguished as well as honest and constant supporters of Charles I. after the breaking out of the civil war, until that king's death, and having transferred his devotion to the son, and rendered important services to Charles II. while in exile, was after the Restoration appointed lord high treasurer, and was created Earl of Southampton, the chief stay of the restored government until his death in 1667.

Lord Southampton, as a member of the House of Peers, approved of the first proceedings of the Long Parliament, on its assembling in 1640, in retrenching the royal prerogative: but left the popular party as did his friend through life, Lord Clarendon, at that time Mr. Hyde, in the course of the proceedings for attainting Lord Strafford. The connection between the father of Lord Southampton and the father of Lord Essex, the parliamentary commander-in-chief at the commencement of the civil war, has led Lord Clarendon to trace, in his eloquent sketch of Lord Southampton's career and character, the early agreement and subsequent separation between the sons. "The great friendship that had been between their fathers made many believe that there was a confidence between the Earl of Essex and him; which was true to that degree as could be between men of so different natures and understandings. And when they came to the parliament in the year 1640, they appeared both unsatisfied with the prudence and politics of the court, and were not reserved in declaring it, when the great officers were called in question for great transgressions in their several administrations." And then after speaking of Lord Southampton's opposition to the bill of attainder against Lord Strafford, he proceeds:—"From this time he and the Earl of Essex were perfectly divided and separated, and seldom afterwards concurred in the same opinion; but as he worthily and bravely stood in the gap in the defence of that great servant [Lord Strafford] (his) to be did afterwards oppose all those invasions, which were every day made by the House of Commons upon the rights of the crown or the privilege of the peers, which the lords were willing to sacrifice to the useful humour of the other." (*Life*, iii. 228.) When the king and parliament took up arms against one another, Lord Southampton zealously joined the king, by whom he was made a member of his privy council and a gentleman of his bedchamber. He was one of the king's commissioners to treat for peace at Uxbridge, in 1645; and Lord Clarendon gives the following account of the zeal which he showed on this occasion:—"He was naturally lazy, and indulged overmuch ease to himself: yet as no man had a quicker apprehension or solider judgment in business of all kinds, so when it had a hopeful prospect, no man could keep his mind longer bent, and take more pains in it. In the treaty at Uxbridge, which was a continued fatigue of twenty days, he never slept four hours in a night, who had never used to allow himself less than ten, and at the end of the treaty was much more vigorous than in the beginning, which made the chancellor to tell the king when they returned to Oxford, that if he would have the Earl of Southampton in good health and good humour, he must give him good store of business to do." After the king's death, he compounded with the ruling powers and resided in England, at his estate near Southampton, and assisted the son of his late master, according both to Clarendon and Burnet, with liberal supplies of money. In the letters passing between Clarendon and the royalists in England immediately before the Restoration, there are several proofs of the high value set on Lord Southampton's counsel and co-operation. "I do not undervalue any man," says Clarendon in one of these letters, "when I say that my Lord Southampton is as wise a man as any the nation hath, as well as of honour superior to any temptation. I shall not need to desire you to communicate all things freely to him." (*Clarendon State Papers*, iii., 750.)

Immediately upon Charles II.'s return to England, while he stayed for two days at Canterbury on his way from Dover to London, Lord Southampton was made a member of his privy council: and before the end of the year 1660 was made lord high treasurer. Lord Southampton's high character for judgment and integrity gave a lustre to the administration. Ill health and the natural indolence of his disposition led him to leave the business of the treasury chiefly in the hands of the secretary, Sir Philip Warwick. In the council he at first strongly advised the king sticking for a larger fixed revenue than that which was granted by the convention parliament, and afterwards was urgent in recommending economy in order to keep within the amount settled; and in the House of Lords he showed himself more disposed to toleration of the Protestant dissenters than his friend and colleague Lord Clarendon. He died on the 16th of May 1667, of the stone, which had caused him great suffering for many years before his death. Mr. Pepys has the following entry in his diary, a day or two after his death: "Great talk of the good end that my Lord Treasurer made; closing his own eyes, and wetting his mouth, and bidding adieu with the greatest content and freedom in the world: and is said to die with the cleanest hands that ever any lord treasurer did." (Pepys, 'Diary,' iii., 222.)

Bishop Burnet has drawn the following sketch of this minister, whose incorruptness in an age of corruption is his chief title to be remembered. "He was a man of great virtue and of very good parts. He had a lively apprehension and a good judgment. He had merited much by his constant adhering to the king's interest during the war, and by the large supplies he had sent him every year during his exile; for he had a great estate, and only three daughters to inherit it. He was lord treasurer, but he grew weary of business, for as he was subject to the stone, which returned often and violently upon him, so he retained the principles of liberty, and did not go into the violent measures of the court. When he saw the king was a lover of money, and his way of managing, or rather of spoiling business he grew very uneasy, and kept himself more out of the way than was consistent with that high post. The king stood in some awe of him, and saw how popular he would grow, if put out of his service; and therefore he chose rather to bear with his ill-humour and contradiction than to dismiss him. . . . Before the Restoration, the lord treasurer had but a small salary, with an allowance for a table; but he gave, or rather sold, all the subaltern places and made great profits out of the estate of the crown; but now, that estate being gone, and the Earl of Southampton disdaining to sell places, the matter was settled so that the lord treasurer was to have 6000*l.* a year, and the king was to name all the subaltern officers. It continued to be so all his time; but since that time the lord treasurer has both the 6000*l.* and a main hand in the disposing of these places." ('History of his Own Time,' i. 173, ed. 1833.)

Earl of Southampton was married three times: first, to Rachael, daughter of Daniel, baron de Ronvigny, and sister to Henry, who was created by William III. Earl of Galway; secondly, to Elizabeth, daughter and coheir of Francis, lord Dunsmore, afterwards Earl of Chesterfield; and thirdly, to Frances, daughter of William, duke of Somerset, and widow of Richard, viscount Molineux. (Banks 'Extinct Peerage,' iii. 671.)

* WROTTESLEY, JOHN, SECOND LORD, M.A., F.R.A.S., President of the Royal Society. This nobleman is the eldest son of Sir John Wrottesley, 8th bart., of Wrottesley, Staffordshire, by Lucy Caroline, who was raised to the peerage as Baron Wrottesley. He was born on the 5th of August 1798, and graduated first class in mathematics at Oxford in 1819, being a member of Corpus Christi College. He succeeded his father in the barony, on the 16th of March 1841.

Taking much interest in practical astronomy, he became, as the Hon. John Wrottesley, an original member of the (Royal) Astronomical Society, and contributed various observations, chiefly of the stars, to its Monthly Notices and Memoirs. In the year 1829, he commenced the erection of an observatory at Blackhouth, where he began to observe, assisted by Mr. John Hartnup (afterwards assistant secretary to the Royal Astronomical Society, and now astronomer of the observatory at Liverpool), in the spring of 1831; having a transit-instrument by Thomas Jones, of 62 inches focal length, and clear aperture 3¼ inches, and a clock by Hardy. Being provided with such means of making astronomical observations, he determined to fix upon some definite object, and steadily pursue that alone. He accordingly selected 1318 stars from the Astronomical Society's Catalogue of 2381, being the stars of the sixth, and from that to the seventh magnitude inclusive, resolving to determine their right ascensions, observing, if possible, each star at least ten times. Having ascertained everything necessary to be known respecting the qualities of the instruments about to be employed, Mr. Wrottesley began the observation of his selected stars on the 9th of May 1831, and on the 1st of July 1835, the task was brought to a conclusion. The catalogue so produced embodies the results of 12,607 observations, exclusive of those of the stars required for comparison. It was read before the Royal Astronomical Society on the 11th of November 1836, and published in the Society's 'Memoirs,' vol. x. The council awarded the gold medal to the author, to whom it was presented by the president, the late Mr. F. Baily, at the annual general meeting of February 8, 1839, after he had delivered an appropriate address, in which he informed the society that when the requisite comparisons had been made with the positions of the same stars obtained at the public observatories—and every star in Mr. Wrottesley's catalogue, he also stated, had undergone that

Digitized by Google

investigation—the result had shown that his catalogue was of first-rate importance, and entitled to implicit confidence. A supplemental catalogue of the right ascensions of fifty-five stars, also observed at Blackheath, appears in the 12th volume of the 'Memoirs.' At the annual meeting of 1841, Mr. Wrottesley was elected president, in which capacity, after his accession to the title of Lord Wrottesley, he delivered two addresses on the presentation of the gold medal to Professor Hansen, of Gotha, in 1842, for his researches in physical astronomy, and to Mr. F. Baily to the following year, for the experiments in which he virtually repeated the Cavendish experiments to determine the mean density of the earth. On April 29th, 1841, he had been elected a Fellow of the Royal Society.

In the beginning of the year 1842, Lord Wrottesley resolved on erecting an observatory near his residence, Wrottesley Hall, and on the 29th of March in that year, the first stone was laid by his youngest son, the late Cameron Wrottesley, Lieut. R.E., who had distinguished himself by his mathematical attainments, and had begun his career as an astronomical observer, which was unhappily terminated by his being killed at the siege of Bomarsund in 1854. The observatory was designed to contain the transit-instrument with which the stars of the Blackheath catalogue had been observed, and an equatorial telescope, with apartments for the observer. The years which immediately succeeded the foundation of the Wrottesley Observatory, were employed in obtaining its position (N. lat. 52° 37′ 23″, Longitude West of Greenwich, in time, 8m. 53·75s.), and in observations with the equatorial, which Lord Wrottesley communicated to the Royal Society, and which have been published in the 'Philosophical Transactions' for 1851. This communication is entitled 'On the results of periodical observations of the positions and distances of nineteen of the Stars in Sir John Herschel's lists of the Stars favourably situated for the investigation of Parallax contained in Part III. of the Phil. Trans. for 1839, and in Part I. for 1827.' The inquiry to which it relates constitutes another example of the mode of doing good service to astronomy which Lord Wrottesley early prescribed to himself, and which he has steadily pursued. Sir J. F. W. Herschel had shown in the papers referred to, and again in his 'Treatise on Astronomy,' that if a star which is optically, though not physically, double (that is, one the component single stars of which appear in close proximity merely on account of their being in arly in the same line of sight, though at different distances from the eye, and not because, revolving about each other in orbits, they constitute a binary system), occupy a certain position with respect to the ecliptic, and one of the components be very much nearer the earth than the other, a considerable periodical and parallactic change will take place in their angle of position, or the angle made with the meridian, by a line drawn through both of them, and the greatest maximum variation from the mean position will occur at two opposite seasons of the year. Lord Wrottesley determined to devote his equatorial to a good trial of this method of discovering parallax, and six years' uninterrupted observing, from February 1843 to October 1849, by his assistant and himself, were given to the work. But these observations were attended with great difficulties, and of sixty-nine double stars selected only forty-eight were observed, and only nineteen at both periods of the year. Of these again, the observations of five only deserved much attention, as exhibiting indications of parallax measurable by this method; but two of them, 82 Eridani and 95 Herschel, Lord Wrottesley finally recommended to the notice of astronomers provided with adequate instruments for observing them. Thus the principal result of the labour and assiduity bestowed on this object, was the illustration of the practical difficulty of the method; and it demonstrated the impolicy of further perseverance, with the instrumental means of the Wrottesley Observatory, especially as instruments had been erected, both at Liverpool and Oxford, preeminently suited to this class of observations. But the zeal which prompted the employment of so much time and force by one astronomer in the pursuit of a mode of research proposed to observers by another, deserves the commendation of every lover of science. The paper is worthy of attention in another point of view. The importance to the correction and advancement of knowledge, of recording failures, and imperfect success in research, has been insisted upon by the highest authorities; modern astronomers have been conspicuous in acting on this principle, and have thus encouraged labourers in other departments to submit to the task so unpleasing to themselves, though so beneficial to their successors; and the candour with which Lord Wrottesley has estimated the amount of success obtained in this arduous inquiry, is equalled only by the devotion and skill displayed in making and discussing the observations.

When the star-catalogue of the British Association appeared, he was anxious to perform the same office in respect to that valuable publication which he had already undertaken and performed in reference to the prior catalogue of the Astronomical Society. For this purpose he selected 1009 stars, with the intention of obtaining at least five observations of each, being those stars which had already been observed at Blackheath, and had been discovered to possess proper motion, with others selected on various accounts. The observations were begun on the 1st of January 1850, and concluded on the 24th of December 1853. They were all made and computed by Lord Wrottesley's assistant, Mr. Richard Philpott, an excellent transit observer, aided in the computations by his second assistant, Mr. Frederic Maton, who had charge of the equatorial. The results were communicated to the Royal Astronomical Society, read on the 13th of January 1854, and published in vol. xxiii. of the 'Memoirs.'

On the resignation of the Earl of Rosse, Lord Wrottesley was proposed and chosen president of the Royal Society, at the anniversary meeting of 1854, and has been re-elected to that office in 1855 and 1856. Having thus been placed at the head of the most ancient and venerable of our British and scientific institutions, he availed himself of the first opportunity afforded him, according to established usage of addressing the Royal Society, at the Anniversary of 1855, of taking a review of some of the desiderata of science in this country, with respect both to the wants of the time and to the interest and encouragement of the nation and the government. In his address of 1856, he resumed the consideration of the requirements and actual condition of scientific knowledge, in connection with the occupation of Burlington House by the Royal Society, in conjunction with the Linnean and Chemical Societies of London, to which an improved appreciation of science on the part of the existing administration had conduced.

Lord Wrottesley married, on the 28th of July 1821, Sophia Elizabeth, third daughter of the late Thomas Gilford, Esq., of Chillington, in Staffordshire; and has had a numerous family, of whom two sons have lost their lives in their country's military service, and another has served in the Crimea, in the late war.

WULSTAN, otherwise WULFSTAN, or sometimes WOLSTAN. Of these names, which appear to be only variations the one of the other, there are three Anglo-Saxon ecclesiastics and writers of more or less celebrity.

1. WULSTAN, a monk of Winchester, of the tenth century, to which all the three forms of the name are given, is the author of a Latin poem Life of Bishop Ethelwold (Ethelwoldi Vita Prosaica), made up of a work in Latin hexameter verse (with a prologue in elegiac) on the miracles of St. Swithin. The former, which is a very poor composition, is printed in the 5th seculum of Mabillon's 'Acta Sanctorum Ordinis S. Benedicti,' folio, Paris, 1685, pp. 638-642. Of the latter only the introduction has been printed (in the same volume, pp. 627-635); but the whole is preserved in several manuscript copies. The verse, though not of much merit, has the reputation of being the best Latin poetry known to have been produced in England in that age. William of Malmesbury, who calls Ethelwold a saint of the church of Winchester, says that he also composed an exceedingly useful work on the Harmony of Tones; but that is no longer extant. Bale says he wrote a Life of King Ethelwulf, which is probably a mistake.

2. WULFSTAN, who was not a monk, became archbishop of York in 1002, having along with that dignity the bishopric of Worcester, as had also been done by his two immediate predecessors, and died in 1023. There is extant in manuscript a letter addressed by him in Anglo Saxon to the people of his province; and he is supposed by Wanley, on probable grounds, to be the Lupus Episcopus to whom are addressed certain sermons or homilies of this age written in the same language. The most remarkable of these is printed, with a Latin translation and notes by William Elstob, in the 'Dissertatio Epistolaris' contained in the third volume of Hickes's 'Thesaurus,' folio, 1703, pp. 99-165; and there is also a separate edition of the same matter, published, in folio, at Oxford, in 1701. There are two pastoral letters in Anglo-Saxon written in the name of Wulfstan, by one (which one is matter of dispute) of the two Alfrics, with both of whom he appears to have been well acquainted: they are stated to have been first composed in Latin, and then, at Wulfstan's desire, to have been translated into Saxon, that they might be more generally useful.

3. WULSTAN, bishop of Worcester, is stated by his biographer, William of Malmesbury, to have been born at Icenium in Warwickshire, to a fair estate; the name of his father was Ethelstan, that of his mother Wulfgiva. From the age he is stated to have attained at his death, his birth must have happened in 1007 or 1008. He began his education in the monastic school of Evesham, but was afterwards removed to the more distinguished seminary of Peterborough. Having at the usual age been ordained a presbyter, he soon after became a monk at Worcester, and gradually rose to be at last prior of the monastery there. In 1062 he became bishop of Worcester on the nomination of Aldred, who, having been two years before removed from that see to the archbishopric of York, had attempted at first, as had for some time been customary, to retain both appointments, but was at last obliged to relinquish Worcester in consideration of only being permitted to name his successor. He chose Wulstan, it is said, conceiving that his mild temper and simple character would prevent him from offering any resistance to his patron's appropriation of the rights and revenues of the see; but in this he found he was cruelly out to be a great mistake. Wulstan proved a very dragon of a bishop, and, especially after the coming over of the Norman conqueror, to whom he very politically paid court, and who took a great fancy to him, he not only set Aldred at complete defiance, but even compelled his successor, Archbishop Thomas, to make restitution to the see of Worcester of sundry lands or pecuniary dues of which it had been despoiled by his predecessors the prelates of York. He also successfully resisted the claim of the archbishop of York to a jurisdiction over the diocese of Worcester, and got that bishopric declared by the king to be in the province of Canterbury. Wulstan continued in the

Digitized by Google

same favour with Rufus which he had enjoyed with his father; and in the beginning of the new king's reign, old as he was, he proved very serviceable in putting down an insurrection of the adherents of Duke Robert of Normandy, defending his city of Worcester against an army of the rebels led by Roger de Montgomery. Wulstan almost rebuilt the cathedral of Worcester from the foundation; and he died in that city, at the age of eighty-seven, on the 19th of January 1095. Wulstan is not known to have written anything either in Saxon or Latin, though William of Malmesbury states that he was a ready and effective speaker in the former language; but in the work entitled 'Ancient History, English and French, exemplified in a regular dissection of the Saxon Chronicle,' 12mo, London, 1830, an attempt is made to show that he was the author of the portion of that venerable record extending from 1034 A.D. to the end of the reign of William the Conqueror. There are two accounts of Wulstan by William of Malmesbury: one in his work 'De Gestis Pontificum;' the other a separate Life, in three books, which is published in the second volume of Wharton's 'Anglia Sacra.'

(Welch's *Biographia Britannica Literaria*, vol. i.)

WURMSER, DAGOBERT-SIGISMUND, COUNT OF, a distinguished Austrian general, was born on the 22nd of September 1724, in Alsace—the territory which now constitutes the French departments of the Upper and Lower Rhine. He commenced his military career in the French service, and having distinguished himself by his courage in the campaigns of 1745-46-47, was raised to the rank of captain in the cavalry. His father having resolved to settle in the Austrian states, and become an Austrian subject in 1750, Dagobert resigned his commission and accompanied him. Such emigrants from the French Rhine provinces were at that time far from uncommon: the Alsatians, though French subjects, were then unmixed Germans; indeed the century which has since elapsed has only stripped their character of its German nationality, without giving them a French one.

Dagobert-Sigismund Wurmser was well received at Vienna. Maria Theresa conferred upon him the office of gentleman of the bedchamber (Kammerherr), and, what he valued more, a troop of hussars, which he continued to command throughout the whole of the Thirty Years' War. After the battle of Prague he was made Major; after that of Lissa, Colonel; after that of Hochkirchen, Major-general; and after that of Leignitz he obtained the cross of the order of Maria Theresa. His kind disposition and generosity rendered him the idol of both the officers and men under his command. There is a story told of him illustrative of these features of his character. Hearing, after the battle of Görlitz, that a brave but poor lieutenant of cavalry had lost his horse in the action, Wurmser sent him one of the best in his stables, with a message to the effect that, having sworn this horse should belong to one of the bravest men in the army, he begged his acceptance of it. In 1773 Wurmser became proprietary colonel of the regiment of hussars which afterwards bore his name; and, when the war broke out again in 1778, he was raised to the rank of Lieutenant-general. At the head of a body of 12,000 men, he broke into the territory of Glatz, and on the 18th of January 1779, surprised the Prussians at Kubelschwerd and defeated them, taking 1200 prisoners. The peace of Teschen arrested his victorious career, and the collar of commander of the order of Maria Theresa was the reward of his exploits during that short campaign.

In 1787 he was appointed general-commander of the province of Galicia, and although the inhabitants were extremely averse to the Austrian yoke, he contrived to make himself a personal favourite. The Emperor Joseph bestowed upon him the appointment of feldzeug-meister (master of the ordnance when the army was in the field). Wurmser was not employed in the war against the Turks in 1789.

The period of Wurmser's career which obtained for him a European reputation commenced in 1793. In February of that year he was ordered to draw together an army in the Breisgau. By the end of the month he was in a condition to advance. On the 3rd of March he entered Mannheim and Spire; and attacked the rear-guard of Custine, who retreated to Landau. Wurmser pursued him as far as Landau, which he summoned, but without effect. Falling back upon the Rhine, Wurmser joined the Prince of Condé at Spire; and having effected a junction with the Prussian army of observation under the Duke of Brunswick, he took up a position at Germersheim to assist in covering the siege of Mayence. After the capitulation of Mayence, Wurmser again pushed forward his corps to the environs of Landau; attacked the fort of Jockmum, and advanced to the base of the Vosges. On the 13th of October, in concert with the Duke of Brunswick, he attacked and forced the lines of Weissenburg. Wurmser pursued the French into his native province; occupied Hagenau; bombarded Fort Louis, which capitulated on the 14th of November; took up a position on the Sarre; and pushed on his outposts to Wanteenu in the vicinity of Strasburg. The miscarriage of an attack by his right on the bridge hampered him considerably; and the Prussians having failed to take Landau, he was left entirely to his own resources. Pichegru, who had been placed at the head of the army of the Rhine in October, and who had judiciously adopted a war of outposts, sharpshooters, and sudden surprises well adapted to the brave but raw troops under his command, when opposed to steady old disciplined troops, harassed him incessantly. Wurmser was obliged to retire within the lines which he had established on the Motter during his advance. The fort of Frischweiler, defended by the elector-palatine, was forced on the 22nd of December, and nothing prevented the French from overwhelming Wurmser. His inn gave way in utter confusion at all points, and he was only able to collect the wreck of his army on the right bank of the Rhine. Having succeeded in the course of January 1794, in re-establishing something like organisation among them, he hastened to Vienna, where the emperor by numerous marks of his esteem sought to express his conviction that Wurmser's reverses were owing solely to the faults of others.

Six months later Wurmser was again appointed to command the army of the Upper Rhine. An accident revealed to him the secret of the correspondence between the Prince of Condé and Pichegru. That Pichegru should have made no effort to turn that negociation to account was not surprising. In the sincerity of the republican general that power could have little confidence, and in the judgment of the Prince of Condé still less. Besides the anxiety of Condé and Pichegru to keep their intercourse a secret from the Austrian government was of itself suspicious. The conspiracy was allowed by Wurmser, the Archduke Charles, and the cabinet of Vienna to take its course, and it led to nothing but its very natural termination in the ruin of the general who had intrigued with the enemies of his country to subvert the government from which he held his commission. Wurmser defeated the French on the banks of the Lauter, on the 28th and 29th of October 1794, and entered Mannheim; the citadel surrendered after a bombardment which lasted a few days.

On the last of January 1796, Wurmser received the grand cross of the order of Maria Theresa. Hostilities did not recommence that year till the month of May. On the 24th of June Wurmser gave way before the attack of Moreau and abandoned Frankenthal. The Austrian cabinet, which had relinquished the idea of assuming the offensive in Alsace and on the Rhine, ordered him to move thirty battalions of his best troops in the army under his command without delay upon the north of Italy. An epoch more full of the impetuosity of youth and the resources of genius awaited the octogenarian hero.

On the 29th of July Wurmser advanced towards Mantua. He drove in the French outposts on the Lago di Garda; but Bonaparte, having already broken up the siege of Mantua in order to present himself on his adversary, met and beat him at Lonato on the 3rd of August, at Castiglione on the 5th, then at Roveredo, and on the 8th at the gorges of the Brenta. The Austrian general far from despairing made an attempt upon Verona; but, repulsed by General Kilmaine, he retreated along the Adige with 5000 foot and 15,000 men, and, after evading two French divisions detached to watch his motions, threw himself into Mantua. This place was vigorously and skilfully defended by Wurmser; but the defeat of the troops under Alvinzy, want of provisions, and sickness among the garrison, forced him to surrender on the 2nd of February 1797. Bonaparte, with that chivalrous spirit which marked his early career, left the veteran entire personal liberty, saying that he respected his years, and did not wish to make him the victim of the intrigues who would doubtless avail themselves of his absence to undermine him at Vienna. Wurmser repaid the generosity of the French general in kind; having detected a plot to poison Bonaparte, he put him upon his guard.

On Wurmser's return to Vienna, the emperor appointed him governor of Hungary, with a salary of 14,000 florins. He did not however survive to take possession of his government, dying at Vienna in the month of June 1797. He was never married: his estates and honours were inherited by a nephew.

WYATT, JAMES, an architect, who occupies a conspicuous place in the history of the art in this country during the latter part of the 18th and the beginning of the 19th century, was born in 1746, at Burton Constable in Staffordshire, where his father was both a farmer and a dealer in timber. At an early age James Wyatt was introduced to Lord Bagot, who, being then about to set out for Italy as ambassador to the pope, took him with him, from which it is probable that his lordship was struck by some symptoms of extraordinary talent, to take charge of a boy of fourteen in order to afford him the opportunity of pursuing studies which he could then hardly have commenced. Arrived at Rome, young Wyatt spent three or four years in that city, examining and measuring the principal monuments of ancient architecture, but, it would seem, without imbibing any taste for its modern ones, since no traces of it are discoverable in his own works. On quitting Rome he proceeded to Venice, where he studied for two years more under Vincentini, an architect and painter, and then returned to England, after being absent altogether about six years, that is, till about 1766 or 1767. Whether his early patron continued to notice, or helped to push him in his profession, we are unable to say; neither do we know with whom the scheme of the Oxford-street Pantheon originated, or whether Wyatt had actually executed anything previously to being employed upon that building, which was finished and opened in 1772; but it at once stamped his celebrity, and he thenceforth became the 'fashionable' architect of the day. "The Winter Ranelagh of the metropolis," as Walpole calls it, established under the auspices of high fashion, and itself the fashion and the rage as a place of amusement, was admired of course by all who pretended to taste or good breeding. It was fitted up in a style of splendour till then unprecedented in this country, and was eminently

attractive as the resort and rendezvous of the gay world; yet how far it merited all the encomiums passed upon it as a work of architecture, it is now hardly possible to decide. Of the original structure nothing now remains except the front towards Oxford-street, rebuilt after the fire, and subsequently altered; nor, though it was esteemed a masterpiece, has any publication of the original designs preserved to us an authentic memorial of Wyatt's Pantheon. There exist indeed views of the great room, or 'rotunda,' but they are such that very little reliance is to be placed upon them; and even were they satisfactory in themselves, they furnish very imperfect information; nor is more to be obtained from description, nothing deserving to be so called having been written at the time.

Greatly as it was admired, the Pantheon did not procure for Wyatt a second opportunity of distinguishing himself in the metropolis by any other building of note, either public or private. Commissions poured in upon him, but all from different parts of the country, and chiefly for private residences, the majority of which hardly aspired to the character of mansions. Taken collectively, that class of his works affords stronger evidence of extensive practice than of superior talent. Considered individually, their architectural merit is of a negative kind. As houses they are commodious and not without a certain air of dignity; but when looked at, they show themselves to be the works of an able builder rather than an architect, and exhibit far more of clever mannerism and of uniformly respectable mediocrity than of style or artist-like treatment, they being nearly all variations of the same design. James Wyatt was a degree or two less frivolous than Adam, yet hardly more dignified; nevertheless it must be acknowledged that we are greatly indebted to both of them, if not for the taste, for the superior accommodation and the refinement of comfort which they introduced into our domestic architecture. Wyatt's Grecian style, admired in his own day for its then almost proverbial 'simplicity' and chasteness, now strikes us as being extremely jejune and bare, and not so marked by as deficient in that artistical simplicity which results from uniform finish throughout, perfect harmony of character, and unity of expression. There is more of the pretty than of the beautiful, of the neat than of the elegant, of the plain than of the simple, in his so-called Grecian or Greco-Italian style; nor could it perhaps be better described than as a sort of genteel commonplace. Probably he would have done more in his art had he been employed on fewer works, for the multiplicity of his professional engagements prevented him from bestowing much study on the respective designs. It has been recorded of him as matter for admiration that he was in the habit of improvising his designs while travelling in his carriage to the places he was about to be employed at; no wonder therefore that so many of them present such sameness and poverty of ideas, and so very little study, being apparently little more than first hasty sketches, with hardly any revising.

Accustomed to this specious commonplace and indolent fertility, he could scarcely rise above it on occasions which either demanded or afforded opportunity for achieving something really noble. His design for Downing College, Cambridge, where however he was not eventually employed, was animadverted upon in a letter from Mr. T. Hope to the architect himself, as being altogether unworthy of the occasion. Neither did Chiswick inspire Wyatt with any kindred feeling, for though the wings which he added to the house rendered it more commodious as a residence, they sadly marred its original grace as a finished gem of Palladian architecture.

About the time of James Lewis's death (1784), the only architect of the period who had shown any knowledge of Gothic architecture in regard to its details, if not its principles, Wyatt began to turn his attention to that style, which he studied in the original examples. There was indeed then hardly any other course to be pursued, for there were no publications, as at present, to initiate the student into it, and facilitate his progress by exhibiting specimens of it in all its manifold varieties. What architects of the present day find delineated and measured for them on paper, and always ready for reference, Wyatt had to draw and measure for himself; it is therefore highly to his credit that under such circumstances, and amidst so many avocations, he gained the insight into it which he did; and that he attained to correctness in his details and individual features, though not to a clear perception of the spirit and true character of the style. Very great allowance is therefore to be made for him and it is scarcely fair, poor as his designs are, to call him, as one who is himself distinguished by his knowledge of that style has done, "James Wyatt of execrable memory."

His first essay in that style was Mr. Barrett's at Lee near Canterbury (1783), and it was for the architect as happy a hit in its way as the Pantheon had been. Extolled by Horace Walpole, it served to bring thenceforward into vogue for modern residences a style of Gothic comparatively admired at the time, but what would now be termed 'mongrel,' tolerably correct in particular features and details — even those however too ecclesiastical, ill applied, and put together without regard to propriety of character. From that time Wyatt became "the restorer of our ancient architecture," and he certainly stood singly without rival or equal. However little merit criticism may now award to any of his productions of that class, we are certainly in no small degree indebted to him for the practical revival of Gothic, although we now perceive that he did not adopt the best course. In the way of making alterations and 'improvements' in the older edifices in that style, he was extensively employed at some of the colleges at Oxford and at the cathedrals of Salisbury and Lichfield; but his works at these places have since been considered rather 'destructions' than 'restorations,' and even at the time occasioned very strong remonstrances. At that splendid caprice, Fonthill Abbey, erected for Mr. Beckford, and now dismantled, there was more of magnificence than propriety of character: instead of being palatial, the edifice was modelled externally after a church, and even as such by no means happily in its general form and proportions. While engaged upon it he succeeded Sir W. Chambers, in 1796, as surveyor-general, which led to his being employed at Woolwich and the House of Lords, and by George III. at Windsor Castle and at Kew, where he began to erect for the king a castellated palace, never completed, and since happily entirely demolished. In 1802, on West's retiring from the office of President of the Royal Academy, Wyatt became his successor, to the no small dissatisfaction of that body. He was however not very long seated there, for the following year West was re-elected.

After this, scarcely any particulars have been recorded of his life, although materials for a full professional biography of him may possibly be in existence. He himself has left none by publishing any of his numerous designs, whereby authentic memorials would have been preserved to us of the Pantheon and some other works of his. Of Fonthill we have illustrations in two works, the one by Britton, the other and more complete one by Rutter; yet both together do not afford satisfactory architectural information. Wyatt died September 5th, 1813, in consequence of being overturned in a carriage while travelling from Bath to London. He left a widow, who survived him till January 27th, 1840, and four sons. The eldest, Benjamin, was the architect of Drury Lane Theatre. We subjoin a list, which, though scanty and imperfect, may be found convenient as far as it goes, notwithstanding that several dates require to be supplied: 1770-2. Pantheon, Oxford-street, London (burnt down, January 14th, 1792). 1778. Doric Gateway, Corpus Christi Court, Christchurch, Oxford. 1783. Lee, in Kent. 1786. Observatory, Oxford. 1788. Library, Oriel College, Oxford: Ionic. 1789. Salisbury Cathedral: alterations. 1789. Balliol College, Oxford: alterations. 1795. Fonthill Abbey, begun. 1796. Military Academy, Woolwich: castellated. 1797. Designs for alterations at Magdalen College, Oxford. 1800. Windsor Castle: alterations. 1800. House of Lords. 1801. Designs for Downing College, Cambridge. Castle Coote, Ireland: Grecian. Cashiobury, Ashridge. Gothic Palace at Kew, now demolished. Mausoleum at Cobham, Kent. Mausoleum at Heidelsby, Lincolnshire.

'WYATT, MATTHEW DIGBY, architect and writer on decorative art, was born at Rowde, near Devizes, Wilts, in 1820, the son of Matthew Wyatt, Esq., late police magistrate of Lambeth-street Police Court. He was educated at Devizes until he was sixteen years old, when he entered the office of his brother Mr. Thomas Henry Wyatt, the architect, and commenced the study of his profession. Within a year he gained a prize given for the best essay on 'Grecian Doric' given by the Architectural Society. In 1837 he became a student at the Royal Academy. In 1844 he went abroad, and studied hard for rather more than two years, bringing home with him on his return nearly a thousand drawings from the principal monuments of architecture and decoration in France, Italy, Sicily, and Germany. The most elaborate of these were a series of 'Specimens of the Geometrical Mosaics of the Middle Ages,' which were published in facsimile in 1848, accompanied with a 'Historical Notice of the Art,' founded upon papers read by the author before the Royal Institute of British Architects, the Archæological Institute, and the Society of Arts. Through his connection with the last-named body, Mr. Wyatt became interested in the practical improvement of manufactures, and was led at various times to communicate to the society the following papers in addition to one on mosaics:—'On enamels and enamelling;' 'On metal-work generally;' 'On the Paris Exposition of 1849;' and 'An Attempt to define the Principles which should determine form in the Decorative Arts.' The last-mentioned formed one of the series proposed by Prince Albert "On the Results of the Exhibition of 1851."

For two years after his return from abroad, Mr. Wyatt was closely occupied in the intervals of his professional engagements in writing for the press generally. In 1848 he re-arranged and decorated the Adelphi Theatre. In 1849 he went down to Birmingham for the 'Journal of Design' to study the Exhibition of Manufactures held at Bingley House, the immediate precursor of the Great Exhibition. He was instructed by the same department to Paris by the council of the Society of Arts to examine and report upon the Exposition held there in that year; he also undertook to prepare reports of it for various journals and periodicals. Mr. Wyatt went with Mr. Cole [COLE, HENRY] to Paris, where they were joined by Mr. Francis Fuller, who, with Mr. John Scott Russell, had been in communication with Prince Albert with respect to a corresponding exhibition in England. Messrs. Cole and Fuller returned to England to start the scheme, find capitalists, &c., leaving Mr. Wyatt to complete the materials for an elaborate report on French experience in the matter.

On his return to London Mr. Wyatt was nominated as secretary, and Messrs. Fuller and Coles commissioners by Prince Albert, to

Digitized by Google

ascertain the views of manufacturers and others with respect to a great national exhibition; and on that errand they visited and canvassed the principal seats of manufacture in the kingdom, holding public meetings in many, and gathering good assurances of support. The results of their work they carried to Balmoral, and received authority to commence the enterprise. In the arduous labours which preceded the appointment of the Royal Commission Mr. Wyatt took an active part, and when this issued he was formally confirmed in the office of secretary to the executive committee, in which capacity he continued to act until the building committee demanded his exclusive attention. His professional knowledge was found eminently useful to the commissioners, and he was employed to superintend the works, make all the necessary contracts, regulate accounts, &c. The work growing in cost to upwards of 50,000*l.* was directed by him as architect, under the supervision of Sir William Cubitt. On the completion of the undertaking Mr. Wyatt had the honour of receiving from Prince Albert his private gold medal, with a letter commending his services from the beginning; he also received a bonus of 1,000*l.* in addition to his salary from the Royal Commissioners. For the Catalogue of the Exhibition Mr. Wyatt wrote a popular account of the construction of the building, and for the Institute of Civil Engineers (of which he is an Associate) a more elaborate account, for which he was rewarded with their Telford medal. In 1850 he formed the acquaintance of Mr. Brunel, who entrusted him with the duty of co-operating with him in designing the new station of the Great Western Railway at Paddington, the waiting-room for her majesty at Windsor, and various other works.

On the opening of the Great Exhibition Mr. Wyatt undertook, at the request of Messrs. Day and Son, an important work upon its contents. This work 'The Industrial Arts of the xixth century,' in 2 vols. folio, with 160 plates in chromolithography, involved no mean amount of labour. While carrying it on however, he found time to bring to a close another work, the preparation of which had been commenced many years previously, and for which, while abroad, he had made many drawings and extensive collections: 'Metal Work and its Artistic designs,' in 1 vol. folio, with 50 coloured plates. He also designed a memorial window in stained glass erected to the memory of William Huskisson by his widow in the summer of 1852. About the same time he became actively interested in the Crystal Palace Company. With Sir Joseph Paxton and Mr. Owen Jones he went into the several questions connected with the designs, arrangements, &c., of the present structure, as well as the objects by which it should be made interesting and instructive. In August 1852 he started on a tour with Mr. Owen Jones to collect works of art from the principal museums, &c., of Europe, and backed by a credit of 20,000*l.* and Foreign Office credentials, met with unexpected success. On his return, after four months' incessant labour, he started through England to collect casts of mediæval sculpture, &c. With Mr. Jones he then set to work on the Fine Art Courts and arrangements of the Crystal Palace, which were sufficiently completed for the opening to take place on the 3rd of June 1854. The principal works falling exclusively under Mr. Wyatt's control were the Queen's Screen, the Pompeian House, the Court of Christian Monuments, and the Byzantine, Mediæval, Renaissance, and Italian Courts. To the latter four he prepared, in co-operation with Mr. J. B. Waring, a series of handbooks, for Messrs. Day and Son he also produced a work in 4to, 'The Crystal Palace and Park.'

In the same year he received her Majesty's commands to design a memorial to the late Mr. Neeld, and to restore the chancel of North Marston, Chantry, Bucks. In 1855 he took charge of the department of English stained glass at the Paris Universal Exhibition for the Board of Trade; and was employed by the East India Company to design and superintend the arrangements of their display. On the opening of the Exposition he was appointed (in conjunction with the Duke of Hamilton) juror for class 24 (furniture and decoration). The duties of the office having been discharged, he was desired to report upon the department by the English government. The report, which was a somewhat detailed one, was subsequently published by the Board of Trade. At the close of the Exhibition Mr. Wyatt was nominated a chevalier of the Legion of Honour for "services rendered to industry and the arts." In the latter part of the year, with his brother Mr. Thomas Henry Wyatt, he competed for the premiums offered to all the world by the War Department for the best designs for barracks, and was fortunate enough to obtain the first premium for cavalry. About the same time he was an historical 'Essay on Ivory carving,' which was published with photographic illustrations by the Arundel Society, for whom he also got up an exhibition, and delivered a lecture at the Crystal Palace (subsequently published) on the works of Giotto at Padua, &c. For these services he was elected an honorary member of the society.

Shortly after his return from Paris, Mr. Wyatt was applied to by the East India Company to co-operate with their regularly appointed architect in preparing designs for additional accommodation to be provided for their museum at the India House; and on the sudden demise of that gentleman in 1856 Mr. Wyatt was appointed to the office he had held. For the Company, since that date, he has executed in this country many works of considerable importance, including in addition to the above, barracks for about 400 men; a military hospital for 100; extensive drainage works, a church, a large drill shed, &c., and several elaborate surveys. For India he has co-operated with the late Mr. Rendel in the design of several great bridges, viz. the Saone, Koul, and the Hullobur, while for the East India Company he has designed an iron church with 900 sittings for Rangoon, and a general post-office and electric telegraph station of large extent for Calcutta.

In the summer of 1850 Mr. Wyatt was invited to become honorary secretary to the Royal Institute of British Architects, to which he had at different times made various communications, and of which, as well as of the Royal Society of Antiquaries, he was a Fellow. In the autumn of 1856 he wrote two essays on 'Renaissance' and on 'Industrial Ornament,' for Mr. Owen Jones's magnificent work, 'The Grammar of Ornament.' He is now preparing a contribution on 'Metallic Art' for Mr. Waring's important publication on the Manchester Exhibition. Mr. Wyatt was an exhibitor of drawings in watercolours at the Universal Exhibitions both of London and Paris, gaining at the former a prize medal with commendation for "good taste in designs generally,' and at the latter a first class medal. We have given a bald statement of Mr. Wyatt's many important labours: but they speak so amply for themselves that any commendation of them would be not merely superfluous but misplaced.

WYATT, RICHARD J., an eminent sculptor, was born in Oxford-street, London, on the 3rd of May 1795. Having chosen sculpture as his profession, he was placed as a pupil with Charles Rossi, R.A.; and about the same time he entered the Royal Academy as a student. During the seven years which he served with Rossi, he twice carried off medals at the Royal Academy. He afterwards worked for a short time in the atelier of Bosio at Paris, and he completed his professional education under Canova, whose acquaintance he had formed in London, and who kindly invited him to Rome, and offered him his advice and assistance in the prosecution of his studies. The atelier of Canova, he had Gibson for a fellow-student, and the friendship here formed between the young students, who were ultimately to rank together as the first English sculptors in Rome, remained unbroken through life. With Canova Wyatt likewise retained the warmest friendship, till the death of the great Italian master. Wyatt went to Rome in 1821, and he made that city his permanent abode, only once making a brief visit to his native country in 1841. He died suddenly at Rome on the 29th of May 1850.

Mr. Wyatt was a man of singularly gentle unassuming temper, and quiet retiring habits. His whole life was spent in the diligent prosecution of his profession—at which he laboured often from dawn till near midnight. The number of his works is very great, and they are of a very unusual order of merit. He was greatest in poetic and classic subjects, in which he displayed a fertility and grace of invention, a singular elegance of thought, and a degree of finish beyond most of his contemporaries. He was undoubtedly one of the purest and most refined of our poetic sculptors. His figures, and especially his female figures, are beautifully modelled, always posed with grace and animation, and always present pleasing forms from whatever point they are viewed. His draperies too are invariably well cast, and he expresses textures truly, yet without breach of sculpturesque propriety. As examples of his style may be mentioned his statues of 'A Nymph adorning the Bath'—one of the most beautiful of his many versions of which, was that executed for Lord Charles Townshend; 'Nymph leaving the Bath;' 'Shepherdess with a Kid;' 'Shepherd Boy;' 'Glycera;' 'Musidore;' 'Bacchus;' and 'Penelope,'—an exquisite statue executed for her Majesty; and his admirable groups of the 'Infant Bacchus and Cupid;' 'Jupiter and Juno;' 'Nymph of Diana taking a thorn from a greyhound's foot;' and 'A Huntress with a Leveret and Greyhound'—his last work. He also produced many excellent portrait busts, some reliefs, and monumental sculpture. At the Great Exhibition of 1851, several of his works were exhibited, and the medal for sculpture was awarded to him, though late. Mr. Wyatt was not a member of the Royal Academy, a bye-law of that institution rendering artists ineligible unless resident in England. Casts from several of Wyatt's works—including most of those named above—are in the Crystal Palace at Sydenham.

WYATT, SIR THOMAS, called 'the Elder,' to distinguish him from his son, the subject of the next article, was born at Allington Castle in Kent, in the year 1503. His father, Sir Henry Wyatt, the representative of a family of some consequence, originally from Yorkshire, appears to have bettered his worldly fortune by attaching himself to the rising fortunes of Richmond, afterwards Henry VII. He was imprisoned in the Tower, in the last years of Richard III., and treated with great severity. Immediately after the battle of Bosworth, he was liberated, and must have been early placed by Henry in situations of emolument, for in 1493 he was able to purchase the castle of Allington. He was one of the executors of Henry's will, and appears to have enjoyed as much favour from the son as from the father. He obtained a grant of part of the estates of Empson, the first that were forfeited to the crown in the reign of Henry VIII. He survived till 1538.

Nothing is known of the tenor of Thomas Wyatt's life previous to his being entered of St. John's College, Cambridge, in 1515, when he was twelve years old. He took his bachelor's degree in 1518, and proceeded to his Master's degree in 1520. The next incident in his life, the knowledge of which has been preserved, is his participation in a

Digitized by Google

magnificent feat of arms performed before the king at Greenwich, at Christmas, 1525. He was then one of the gentlemen of the king's bedchamber. He was married by this time to Elizabeth, daughter of Brook, Lord Cobham. The year of his marriage is not known, but his eldest son Thomas was born either in 1521 or 1523. A long interval of seven years, entirely barren of events, succeeds. In 1532 he was one of Anne Boleyn's train when she went from Dover to Calais a short time before her marriage; and in July 1533, we find him officiating for his father at her coronation.

This meagre array of incidents merely indicates that Wyatt was a young gentleman who had been well educated; early "settled in life" by marriage; and introduced at court under the auspices of a father who had influence enough to obtain for him appointments suited to his age. He had already obtained some notoriety as a poet, for Leland, in some Latin verses addressed to him from Paris, compliments him on his compositions. In person he was strong, but elegant; with fine features, a penetrating eye, and a mouth of singular sweetness. He was dexterous in the use of arms; he sung, played well on the lute, and he spoke French, Italian, and Spanish with fluency. His readiness at repartee is a constant theme of his contemporary eulogists.

There is much perplexity in the accounts of the danger in which he was involved on account of Anne Boleyn. So contradictory are the statements, that it is impossible to decide at what time he was placed in peril, and whether as friend or foe of that lady. Fuller's "Sir Thomas Wyatt fell, as I have heard, into King Henry's disfavour about the business of Anne Boleyn, till by his industry, innocence, and discretion he extricated himself"—admits of either interpretation. Judging by Henry's character, it seems more probable that Wyatt fell into temporary disgrace from having shown his aversion to the match, than from his having been suspected of too much intimacy with the lady. Anne Boleyn, it may be observed, was executed in May 1536; on the 13th of March of that year Wyatt was dubbed a knight by the king; and in 1537 he was with the king's sanction nominated high sheriff for Kent at a period of considerable danger.

The remaining part of Wyatt's life was passed in the toils of diplomacy and anxieties of court intrigue. In April 1537, he was appointed to succeed Pate as Henry's minister at the Spanish court. He remained at Madrid till the beginning of 1538. In May he was sent back to Spain (Bonner being joined in commission with him); in June he followed the emperor Charles V. to Nice on his expedition to meet the Pope and Francis I.; in July he was with Charles at Aigues Mortes. In April 1539, he was recalled, but was detained in Spain till June. The principal service he performed for his king during his Spanish mission was keeping him informed of the intrigues of the court. The indifferent reception that Cardinal Pole experienced at the hands of Charles V. at this time was attributed to the boisterous management of Wyatt. He had urgently solicited to be recalled for nearly a year before he could obtain his wish. His desire to return to England was excited in part by the necessity of looking after his family concerns, his father having died about this time; and in part by the necessity of being at hand to meet the charges brought against him by Bonner. The distaste he entertained for Spain was probably occasioned in a great measure by the anxious state of his mind. All his verses written at this time are in a desponding tone. When not engaged in business he employed himself in corresponding with his son, or in superintending the education of a young person of the name of Baker, recommended to his care by Wriothesly, or in composing verses. He mixed little in society; his principal associates were the ambassadors of Venice and Ferrara.

He was not allowed to remain long unemployed. Towards the close of 1539 the emperor began his journey through France into the Netherlands, and in November Wyatt was appointed ambassador-extraordinary to the imperial court, with instructions to join Charles on his road through France. Wyatt accordingly joined the emperor at Blois, on the 11th of December, accompanied him to Paris, and left that city on the same day with him (7th January), proceeding direct to Brussels, there to await his arrival. He continued in attendance on the court at Brussels and Ghent till about the middle of May, when he returned to England. Wyatt had scarcely reached Cromwell in presenting the match between Henry and Anne of Cleves. During his residence in the Netherlands he consistently advocated the policy of supporting the duke of Cleves and the Protestant princes of the empire. By this course he run counter to the inclinations of the king, and, in common with Cromwell, lost favour with him.

Wyatt had grown averse to business, having been disgusted with the falsehood of the statesmen with whom he had to deal; but prudence had also a share in his resolution to retire from his diplomatic career. He was aware that Cromwell's enmities were against the ascendancy, and knew that the fall of the mini-ter would involve his own. He was not mistaken. Although Henry received him on his return in a manner that seemed to imply satisfaction with his conduct, he was arrested, towards the close of 1540 or the beginning of 1541, on the old charges of Bonner, which had been understood to be departed from. Although neither allowed to cross-examine Bonner's witnesses nor produce any of his own, he was acquitted, about the month of June 1541. On the 10th of July following he obtained a grant of lands in Lambeth from the king; in 1542 he was created High Steward of the king's manor of Maidstone; and in the same year he received additional valuable grants. These favours would seem to imply that Henry was convinced of his loyalty and satisfied with his services.

The brief remainder of his life was spent in retirement at Allington. He has himself informed us that when the season permitted he was used to hunt and hawk; that in the depth of winter he was fond of shooting with his bow; and that when the weather confined him to the house, he devoted himself to study or the composition of verses. On October 1542, he was unexpectedly summoned to attend the king, and, eager to show his zeal, overheated himself in his hasty journey. He was seized in consequence with a fever at Sherborne, and died there on the 11th of the month.

Wyatt was one of the most elegant and accomplished courtiers of his age; and a statesman of great sagacity, dexterity, and integrity. There were four reasons, it is remarked by Lloyd, why men went to dine with him:—"first, his generous entertainment; secondly, his free and flowing discourse of Spain and Germany, an insight into whose interests was his masterpiece, they having been studied by him for his own satisfaction as well as from the exigency of the times; thirdly, his quickness in observing, his civility in entertaining, and his readiness in encouraging every man's peculiar parts and inclinations; and lastly, the favour and notice with which he was honoured by the king." Wyatt has left writings both in verse and prose. His amatory verses are, in regard to matter, much like other amatory verses. Their language, though less fluent than that of modern ballad-mongers, who have a language made rhythmical to their hand, is sufficiently polished to entitle him to be regarded as one of those whose works mark the progress of the language. His satires have more of matter in them, and more of nerve in the versification. The first is remarkable as containing the earliest English version of the Town and Country Mouse. Of Wyatt's prose writings, his letters on state business show much shrewdness; his letters on private affairs, much ease, elegance, and well disciplined mind. Taking into account the time at which he wrote, his prose has always struck us as more to be admired than his verse.

WYATT, SIR THOMAS (the Younger), only son of the preceding, was born in 1520, or at the latest in January 1521. He was married to Jane, daughter of Sir William Hawke, of Bourne in Kent, in 1536 or 1537, when he could not have been more than fifteen or sixteen years old. It has been conjectured that his father was induced to wedlide him so early in life in order to give greater stability to a character which threatened to be unsteady. The supposition is rendered plausible by the tone of two letters addressed by the father to the son a year or two after the marriage, which have been published by Mr. Nott.

In October 1542, Wyatt succeeded to his father's estates, and before little more than a year had elapsed, executed a deed (discovered by Mr. Cayley in the Augmentation Office), which further corroborates the suspicion of the wildness of his youth—an alienation of his estate of Parnham in Dorsetshire in favour of Francis Hay, his cousin, son by the daughter of Sir Edward Dorrel, of Liddlecote. In April 1543 he had been imprisoned for assisting the Earl of Surrey in breaking the windows of the citizens of London at night with stones shot from a crossbow. Surrey gravely said in after-life that his intention was, by frightening the citizens through the sudden and mysterious breaking of their windows, to turn them to repentance; but this ingenious defence, if alleged before the privy council, availed neither himself nor his accomplices Wyatt and Pickering.

After his release from the Tower, Wyatt raised a body of men at his own expense, and did good service with them at the siege of Landrecy. It appears from the statements of Churchyard that the military talents of Wyatt were soon acknowledged. Early in 1545 he was placed in command at Boulogne, and constantly employed against the French in that quarter. When Surrey was appointed governor of Boulogne in September 1545, Wyatt was made one of the council. "I assure your majesty," Surrey wrote to Henry VIII. respecting Wyatt, "you have framed him to such towardness of knowledge in the war, that none other dispraised, your majesty hath not many like him in your realm for hardiness, painfulness, and circumspection, and natural disposition to the war." Wyatt continued to hold his situation at Boulogne after Surrey's recall, and even, it has been assumed, till the place was finally given up to the French in 1550.

During the latter part of the reign of Edward VI., Wyatt appears to have lived chiefly at Allington. The part he took immediately after the king's death is ambiguous. Sir John Bridges subsequently reproached him in words which seem to imply that he had appeared in arms in favour of Lady Jane Grey; but Wyatt in his defence before the privy council asserted that he had only left the queen against the Duke of Northumberland, as my lord of Arundel can witness."

In the year 1554, when the Spanish match was in agitation, Wyatt was persuaded to take the command of the Kentish men in the rising concerted with the Duke of Suffolk. The other conspirators were surprised before they could proceed to action, but Wyatt with his force having gained some considerable advantages over the royalists, pushed on to Southwark. An attempt to surprise Ludgate on the 7th of February failed, and he with one or two of his followers were separated from the body of his troops and taken in Fleet Street. His conduct

Digitized by Google

at the moment of his capture, as narrated by Stow, gives him the appearance of one who had completely lost his self possession. He was not tried till the 15th of March, and he is accused during the interval of having implicated Elizabeth and others by his confessions, in a way neither creditable to his courage nor his fidelity. When however the attorney-general charged him on his trial with having brought the Lady Elizabeth in question, he replied, "I beseech you, being in this wretched state, overcharge me not, nor make me seem to be that I am not. I am both by access any person by name, but that I have written I have written." He was executed on the 11th of April.

Sir Thomas Wyatt appears to have been a zealous Protestant in theory, although religion does not seem to have exercised much practical influence on his conduct. In his youth he appears to have been rather wild than licentious. He was possessed of strength and address, and that kind of courage which carries a man with éclat through a battle-field, but breaks down under adversity and imprisonment. His sons when taken prisoners at Ludgate, and on his trial, was that of a man bewildered and borne down by his reverses. He does not appear to have possessed any of his father's literary talent. It is probable however that he had some taste for letters, or was at least capable of taking pride in his father's distinction. The Harrington manuscript, quoted by Mr. Nott ('Works of Henry Howard, Earl of Surrey, and of Sir Thomas Wyatt the Elder'), contains Sir Thomas Wyatt's (the Elder) poems in his own handwriting, arranged into two classes, and numbered by his son, who had also copied into the volume two letters of advice which his father sent to him from Spain.

WYATVILLE, SIR JEFFRY, nephew of James Wyatt [WYATT, JAMES], and son of Joseph Wyatt, was born August 3, 1766, at Burton-upon-Trent, in Staffordshire, at the free-school of which place he received his education. At school he appears to have been of truant disposition, and was so far from displaying any predilection for studies connected with his future profession, that he was bent upon going to sea, and made two attempts to do so, the first at the age of twelve, the second about two years afterwards, but on both occasions he was pursued and brought back. At the age of seventeen he was to have gone out with Admiral Kempenfelt, in the Royal George, but being prevented from joining the vessel in time, he escaped the fate which awaited it at Spithead. Thus thwarted, he betook himself to the metropolis in the hope of finding some opportunity of entering into the naval service, but as the American war had terminated, no such opportunity offered.

These disappointments however were all so many turns of good-fortune, which reserved him for higher fortune and distinction than he might else have obtained. He was not left a friendless adventurer in the metropolis: his uncle the architect and builder (Mr. John Armstrong) who had extensive government contracts, got him into business with him. The line of business he now engaged in was eminently respectable and lucrative; still it proved for about twenty years a bar to his admission into the Royal Academy as a member of that body, nor perhaps altogether improperly. It did not however prevent his being employed very extensively as an architect by many noblemen and gentlemen in various parts of the country, either in improving and making additions to their mansions or erecting new ones. Nearly all his works are of this class, however varied in themselves, with the exception of the new front of Sidney Sussex College, Cambridge (1833). He was not therefore so much known by repute to the public generally, as he might have been, had he been employed on buildings more open to notice.

It seems to have been unexpected by himself when he was summoned to Windsor by George IV. in 1824; and perhaps it occasioned some surprise in others, when it was first announced that Mr. Jeffry Wyatt was to be the architect employed in remodelling the Castle—such an opportunity for the display of talent as had not till then been offered to any one in the profession for full a century. The works were set about immediately after the approval of the architect's plans, the first stone of 'King George IV's Gateway' (forming the principal entrance into the quadrangle on the south side, in a direct line with the long walk) being laid by the king himself on the 12th of August 1824; on which occasion Wyatt was guilty of the absurdity of adding "by royal authority," the silly appendage "ville" to his name, in order to distinguish himself from the other architects named Wyatt. On the king taking possession of the private apartments, December 9, 1828, he was knighted. The completion of the alterations at Windsor Castle occupied him almost exclusively for the remainder of his life, during which he resided chiefly at Windsor, within the precincts of the Castle, in what is called the Wykeham Tower, at the western extremity of the north terrace; and where, after suffering for the last five years of his life under an asthmatic complaint, he died, February 18, 1840, in his seventy-fourth year, and was buried in St. George's Chapel. Sir Jeffry had been a widower thirty years, having lost his wife (Miss Sophia Powell) in 1810; and of their three children, Augusta, the youngest and favourite daughter, died at Windsor, in 1825; and George Geoffry in 1833; Emma (Mrs. Hambly Knapp) alone surviving him.

It was the architect's good fortune to behold his great work brought to completion by himself, at a cost of 700,000*l.*, and it was his intention to publish the designs, which he started to be done by his executors, under the superintendence of Mr. H. Ashton. The work was accordingly brought out on a magnificent scale in two volumes, large folio, 1841, and forms, as regards the exterior of the Castle, one of the most complete and elaborate series of illustrations ever published of any single edifice, but is nevertheless defective, inasmuch as, with the exceptions of the plans, there is nothing to afford any information with regard to the interior, which, if not exactly what Sir Jeffry wished to make it, contains much that would have been interesting both to professional men and the public.

It is further to be regretted that of his other works no authentic illustrations have been published in any shape, not even of the princely seat of Chatsworth, to which he made very extensive additions during the last twenty years of his life. He was also employed at Longleat (Marquis Bath), Wollaton Hall, Notts, and completed Ashridge, the seat of the earl of Bridgewater, which had been begun by James Wyatt; lodges and other buildings in Windsor Park; a temple at Kew; and alterations at Bushy for the queen dowager.

WYCHERLY, WILLIAM, son of Daniel Wycherly, Esq., of Clevare, in Shropshire, was born about 1640. In his fifteenth year he was sent to travel in France, probably because his father's loyalist opinions rendered him doubtful of the universities at that time. He does not appear to have returned to England till a short time before the Restoration. He resided, during the greater part of his stay in France, on the banks of the Loire, at the house of Monsieur —— at that time governor of Angoulême, and Wycherly was favourably received at the court of his duchess, Julia d'Angennes Rambouillet, celebrated in Voiture's letters. "This little court, learned and strict (savante et prude), may," says a French biographer, "have given Caractère of propriety to the young Englishman, of which he made only an indifferent use." At the time, the tone of that court certainly did exercise considerable influence on the mind of Wycherly, for during his residence in France he solemnly abjured the Protestant faith, and was received into the bosom of the Roman Catholic Church.

On his return to England, Wycherly was entered as a student of law in the Middle Temple. It would appear however, from a passage in Wood's 'Athenæ Oxonienses,' that he was previously sent for a short time to Oxford to be reconciled to the Anglican Church. At that period, a person is "not a gown," only living in the lodgings of the provost of his college, was entered in the public library under the title of Philosophiæ Studiosus, in July 1660, being then about twenty years of age. He departed without being matriculated, or a degree conferred on him, having been by Dr. Barlow reconciled to the Protestant religion.

It is not easy to trace with certainty Wycherly's career from 1660 till 1669 or 1670, when he produced his first play. The accounts of his favour with Charles II., intrigues with the Duchess of Cleveland, his introduction to Buckingham, and his intimacy with Rochester, are all derived from conversational gossip. It is sufficiently apparent however that he possessed means which enabled him to mingle with the gay world on a footing of equality, and that, forgetful of the lessons of the "petite cour savante et prude," he conformed to the manners of the time. Major Pack states that the family estate was worth 600*l.* a year in the time of Wycherly's father.

Wycherly's first play, 'Love in a Wood, or St. James's Park,' was produced after May 1669, and before November 1671, with a success which enabled him to take rank as one of the leading wits of the day. His three other plays were all equally fortunate. 'The Gentleman Dancing-master' appeared about the close of 1671; the 'Plain Dealer' in 1674; and the 'Country Wife' in 1678. The plays however appear to have been composed some time before they were acted—in 1669, 1671, 1665, 1671. There is much wit in these productions, but more manly common-sense expressed in rare English. Their licentiousness will prevent their ever again becoming popular. The impression produced on Wycherly by the severe decorum of the Duchess of Montausier's court had been completely obliterated by the licentious society in which he had subsequently mingled. But his intellect, though familiarised with impurity, had not been enervated. He had a strong and just perception of character, and expressed it with vigour and felicity.

Several years after the appearance of 'The Plain Dealer,' Wycherly encountered the Countess of Drogheda, a young, rich, and beautiful widow, at Tunbridge. They met in a bookseller's shop. The lady came to inquire for 'The Plain Dealer,' and the master of the shop presented Wycherly to her as the real plain dealer. This must have been subsequent to June 1679, when the earl died. They were soon

Digitized by Google

after privately married. The lady was (probably not without good reason) distractedly jealous. Dennis relates that their lodgings were in Bow street, Covent Garden, opposite the Cock Tavern, and if at any time he entered that place of refreshment with his friends, he was obliged to leave the windows open that she might see there was no woman in the company. Of course a person of this disposition would feel considerable reluctance in leaving her husband at the court. The unfrequency of Wycherly's appearance there gave umbrage, and lost him the favour of Charles.

The countess did not long survive her marriage. She settled her whole estate upon Wycherley, but the settlement was disputed after her death, and, ruined in his expectations, legal and other expenses, he was thrown into prison. There he lay several years. It is said that he was at last relieved by James II., who, having gone to see 'The Plain Dealer' acted, was so delighted, that he was induced to give orders for the payment of the author's debts and settling a pension of 200*l.* a year on him. The story has an apocryphal air. It is certain that Wycherly in after-life returned to the Romish Church, and this, with some remains of court influence, is more likely to have attracted to him the munificence of James.

Wycherly did not profit by the king's liberality to the full extent, for, ashamed to confess the amount of his debts, he understated them. His pension dropped at the Revolution. His father's estate, to which he succeeded some years later, was strictly entailed, and the income was attached by his creditors. A more decorous, if not a more virtuous generation had risen up, and Wycherly's strain of wit was no longer the fashion. He continued to struggle with his difficulties till 1715, the year of his death. Eleven days before that event, in the eighteenth year of his age, he was married to a young woman with a fortune of 1500*l.* What attractions such a match could possess for the lady it is difficult to imagine. He contrived to spend a great deal of her money; but repaid her on his death-bed by the judicious advice, "not to take an old man for her second husband."

In 1704 Wycherly published a volume of poems, to which he prefixed an engraving from his picture painted by Sir Peter Lely in the prime of life. Below this portrait he inserted the motto 'Hen quantum mutatus ab illo!' A volume of poems, and 'moral reflections,' which he had in part prepared for the press, was published posthumously in 1728, by Major Pack, who prefixed a very slovenly and meagre memoir of the author. Wycherly's poems are defective in rhythm, and have not much of what is properly called feeling in them; but they are not unfrequently characterised by his vigorous common-sense. Some of his 'moral reflections' are terse and pointed.

(Major Pack's *Memoirs of William Wycherly, Esq.*; Dennis's *Letters*; *Biographia Britannica*. Leigh Hunt's biographical notice of Wycherly in Moxon's edition, and the review of the notice in the *Athenæum*; and before drawing any conclusions from the Wycherly Letters as published by Pope, the literary student would do well to see what is said on the subject in the *Athenæum* for October 3, 1857.)

WYCLIFFE or WICLIF (two of the most common among about twenty variations of the spelling), JOHN DE, appears to have been born about the year 1324, and, according to the most probable account, was a native of the parish of the same name, situated about six miles from the town of Richmond in Yorkshire. The tradition of the place makes him to have been a relation of a family of the name of Wycliffe, or De Wycliffe, who were lords of the manor and patrons of the rectory from the Conquest down to the year 1606, when the property passed by the marriage of the heiress into a family of another name. The earliest fact that is known respecting Wycliffe is, that he was one of the students first admitted at Queen's College, Oxford, which was founded in 1340. He soon however removed to Merton College. He is said to have applied himself with diligence and success to the study of the civil, the canon, and even the common law; but the departments of learning in which he acquired the greatest distinction were scholastic philosophy and divinity. The chronicler Knighton, who on every occasion evinces and openly expresses the keenest aversion to Wycliffe's doctrines and proceedings, admits that he was esteemed the most eminent theological and philosophical doctor of his time, and that in the employment of the scholastic dialectic he had no equal.

Wycliffe's first publication, as commonly stated, is a tract entitled 'The Last Age of the Church,' which is inferred from internal evidence to have appeared in 1356. It was printed for the first time with a preface and notes by the Rev. James Henthorn Todd, D.D., Dublin, 16mo., 1840, from the only known manuscript in the University library, Dublin, in which shape it fills thirteen or fourteen short pages, making altogether not much above two hundred lines. For anything that this performance can add to the reputation of Wycliffe, it might have been left in oblivion; it is an attempt to prove that the world would come to an end with the then current century, grounded principally on the prophecies attributed to the Calabrian monk Joachim (who lived in the 12th century, and whose own calculation was that the end of the present system would happen in 1260), and on a cabalistic computation from the letters of the Roman alphabet, which appears to be the writer's own. These dreams of Wycliffe seem to have arisen out of the impression left by the great pestilence which desolated Europe in 1348. Dr. Todd however has ventured in his preface (pp. xii-xv., and notes, p. lxxxi.) to suggest a doubt whether the tract can with perfect certainty be assigned to Wycliffe, and also whether the passage from which the date of its publication or composition has been inferred is conclusive as to that matter.

It is affirmed by all Wycliffe's biographers that he began to distinguish himself by his writings against the Mendicant Orders about the year 1360. The fact may be so, but the earliest testimony to it, we believe, is that of Anthony Wood, who may have derived his knowledge from the records of the University of Oxford. There is nothing upon this subject among the extant writings attributed to Wycliffe which can be assigned to nearly so early a date. The statement however is in itself very probable; the contest between the Mendicants and the University was at its height about 1360; and about the same time Wycliffe appears to have been in high favour at the university; for in 1360 or 1361 he was made warden or master of Balliol Hall (as Balliol College was then called), and in the beginning of 1361 he was presented by that society to the rectory of Fyfingham or Filingham, a living of considerable value, in the diocese of Lincoln.

In 1365 Wycliffe appears to have resigned the mastership of Balliol for that of Canterbury Hall, then recently founded by Archbishop Islep. He was put into this place by the archbishop in December of that year, in the room of a monk named Henry de Wodehall, who had been originally appointed, but whose turbulent conduct had compelled the founder to remove him. In 1366 however Islep was succeeded in the primacy by Simon Langham, who had been himself a monk; and then a process was commenced with the object of ejecting the secular warden from Canterbury Hall, on the pretence that his nomination had taken place when Islep was incapacitated by weakness both of body and mind for the transaction of business. It appears that Wycliffe's appointment was originally sold by the archbishop; that a person named John de Radyngate was in the first instance substituted in his place; but that, within a month after, Wodehall was restored. Wycliffe appealed against the sentence to the pope, but it was confirmed by his holiness in 1370; and in 1372 it was further ratified by the king, Edward III.

It is singular that Mr. Webb Le Bas (in his 'Life of Wicliff,' Lon., 8vo, 1832) should in an elaborate argument entirely constructed upon a comparison of dates (pp. 121-125) have assumed that Wycliffe's master-ship of Canterbury Hall was in 1365. It is correctly given in only a few pages before (p. 117), that Archbishop Islep died in 1366, and that the proceedings in the case were commenced under his successor Archbishop Langham. Wycliffe's appeal was certainly not made till 1367, in the month of May of which year Wodehall was pronounced contumacious for not having been then two years pending, as Mr. Le Bas argues, it had probably not commenced when Wycliffe was, in 1367, publicly challenged by a monk to defend the decision of parliament that the king should not do homage to the pope; a challenge which, as is stated by Mr. Le Bas, he promptly accepted. In this reply to the monk, which is printed from a manuscript in the Lambeth library, by Lewis, 'Life of Dr. John Wiclif,' Papers and Records, No. 30. It is in Latin, being entitled 'Determinatio quædam Magistri Johannis Wyclyff de Dominio contra unum Monachum;' and in it the author calls himself "the king's own chaplain" ("peculiaris regis clericus"). He protests that, as an humble and obedient son of the Roman church, he desires to assert nothing injurious to the said church, or that could reasonably offend pious ears.

In 1368, while his suit at Rome was certainly depending, he exchanged his living of Fillingham for that of Ludgershall, in the same diocese, but in the archdeaconry of Bucks, which was of less value, but was recommended to him by being nearer Oxford. In 1372, having taken his degree of D.D., he publicly professed divinity and read lectures in it in Oxford University. This "he did," Lewis continues, "with very great applause, having such an authority in the schools that whatever he said was received as an oracle. In these lectures he frequently took notice of the Corporation of the begging friars, which at first he did in a soft and gentle manner, until, finding that by detecting their abuses was what was acceptable to his hearers, he proceeded to deal more plainly and openly with them." Some of his treatises that survive were probably written about this time, but there is no positive evidence to that effect.

The next fact in his history that is ascertained is his appointment, in July 1374, as one of the members of a legation sent by Edward III. to Pope Gregory XI., then residing at Avignon, to treat with his holiness about the practice of papal provision and other abuses against which the English parliament had recently passed several laws and resolutions, more especially the Statutes of Provisors and Præmunire in 1350. The circumstance that Wycliffe's name stands second in the royal commission (the first name being that of John, bishop of Paenor) may be taken as attesting the high public reputation to which he had by this time risen. The seat of the conferences was fixed at Bruges; the negotiation resulted in a very partial mitigation of the evils complained of; but Wycliffe is supposed to have had his aversion to the then prevalent ecclesiastical system considerably sharpened by his experience of the papal court. In the meantime however he did not deem it necessary to decline what of its advantages might fall to his share. Either while he was still abroad, or immediately after his return home, he was presented by the king to the prebend of Aust in

Digitized by Google

the Collegiate church of Westbury, in the diocese of Worcester: the letters patent of ratification are dated November the 6th, 1375. And about the same time he appears to have been also presented to the rectory of Lutterworth in Leicestershire, the right of nominating to which had fallen for this turn to the crown, in consequence of the minority of Lord Henry de Ferrars of Groby, the patron. Lewis thinks it probable that Wycliffe now left Oxford, or at least was always at Lutterworth during the vacations. "Here," he says, "as it appears by his sermons yet remaining in manuscript, he performed the office of a very diligent and edifying preacher, since he preached not only on Sundays, but on the several festivals of the church, and of a most exemplary and unwearied pastor." There are about 300 of his parish sermons still extant.

He now however began to speak his sentiments very openly on the subject of the pope and the church. Lewis quotes him as in one of his writings or lectures soon after his return to England styling the pope "Antichrist, the proud worldly priest of Rome, and the most cursed of clippers and purse-kervers" (cut-purses). The consequence was, that in a convocation of the clergy, held on the 3rd of February, 1377, a citation was directed to be issued for his appearance at St. Paul's on the 19th of the same month, to answer the charge of holding and publishing certain heretical or erroneous doctrines. Lewis appears clearly to be mistaken in supposing this to have happened in 1378. Wycliffe presented himself on the appointed day, accompanied by John of Gaunt, Duke of Lancaster, and the Lord Henry Percy, earl marshal; a violent altercation immediately arose between these noblemen and Courtney, bishop of London; the crowd, which was very great, broke out into a tumult; and the result was, that the court rose without having done anything. The mob seems on this occasion to have sided with their bishop against Gaunt and Wycliffe.

A story told by Dr. Vaughan adds a reference made to Wycliffe by the first parliament of Richard II., which met in October 1377, on the subject of the right of the kingdom to retain its treasure, when required for its own defence, although demanded by the pope, and about a vindication of that right which he therefore drew up, appears to be indifferently supported. It rests, we believe, on no better authority than that of Fox's 'Acts and Monuments.' Wycliffe may have drawn up some such paper; but probably not in answer to an application from the parliament. Be this however as it may, the prosecution against him for his errors of doctrine was speedily renewed in a more formidable shape. On the 22nd of May, 1377 (not the 11th of June, as Mr. Le Bas translates 'XI. Calendas Junii'), a bull was addressed by Pope Gregory to the Archbishop of Canterbury and the Bishop of London, directing them to summon Wycliffe before them, and without delay to the king, requesting his favour and assistance in the matter, and to the University of Oxford, desiring them to withdraw their protection from the accused theologian. Before the bulls reached England, which they do not appear to have done till November, King Edward was dead; but Archbishop Sudbury caused his mandate about the end of December for Wycliffe to present himself in the church of St. Paul's, Loudon, on the 30th court-day from that date. The accounts that have come down to us are very imperfect and obscure; it appears that Wycliffe did come, or was brought, early in the following year, 1378, before a synod assembled, not in St. Paul's, but in the archbishop's chapel at Lambeth. This new attempt to put down the reformer however was not more successful than the former; the Londoners now, if we are to believe the chronicler Walsingham, upon whom we are principally dependent for our information as to what took place, shewed themselves disposed to take part with Wycliffe, and, breaking into the chapel, threw the synod into consternation; and the safety of the prisoner was secured by the arrival of Sir Lewis Clifford with a message from the king's mother positively prohibiting them from proceeding with the cause. He was let off with a simple admonition to abstain from repeating the objectionable propositions, that the laity might not be made to stumble by his perversions; no injunction which, says Walsingham, he treated with contempt, persisting in scattering about conclusions still more pernicious.

The circumstance however that finally and effectually saved Wycliffe was the breaking out of the great schism of the West by the election of the two popes on the death of Gregory XI. in this same year 1378. This division and dissension of the Roman world so enfeebled the papal power in England and everywhere else, as to leave it for the present very little of active energy or disposition to proceed to extremities against its enemies where it was possible to take another course. Wycliffe accordingly appears to have been allowed to go on for some years preaching and writing as he chose without further disturbance. In the beginning of 1379 he was seized while at Oxford with a dangerous illness, from which however he recovered. Soon after he got well he is supposed to have published his tract entitled 'De Papa Romano,' or 'Schisma Papæ,' still preserved in manuscript, in which he called upon all kings throughout Christendom to seize upon the opportunity sent them by Providence of bringing down the whole fabric of the Romish dominion, seeing that Christ had cloven the head of Antichrist and made the two parts fight against each other. This was followed by other writings, both in Latin and English, of which by far the most important was his translation of the whole Bible from the Latin Vulgate, being it is commonly believed, the first complete English version of the Scriptures which had appeared. There is reason to believe that this great work was finished, and several transcripts of the whole made and dispersed, some years before the death of Wycliffe; but it is probable that it was not all executed by himself, although it may have all undergone his revisal.

Some odium seems to have been brought upon Wycliffe and his novel opinions by the great outbreak of the Commons, Wat Tyler's insurrection, in 1381, which it was natural enough for the friends of the established religion to refer, in part at least, to the destruction of old convictions and of all reverence for authority, which he and his followers had laboured to produce. For Wycliffe, it is to be noted, while he himself remained stationary at Lutterworth or Oxford, preaching or lecturing there, had numbers of disciples whom, under the name of 'poor priests,' he kept itinerating over the country, in imitation, apparently, of the same effective system for acting upon the great body of the population of which the mendicant order of monks had already set the example. There can be no doubt that his opinions were thus very generally disseminated and adopted. He new besides took what was considered the boldest step upon which he had yet ventured, by attacking the doctrine of transubstantiation. This he did, according to Anthony Wood, in a course of divinity lectures which he read in the summer of 1381 at Oxford. An assembly of twelve doctors, summoned by the chancellor, unanimously condemned his conclusions, and denounced imprisonment and excommunication as the punishments of whoever should maintain them. Some months after, in May 1382, a synod of fifteen bishops and doctors assembled at the priory of the Grey Friars in London, on the summons of his old enemy Courtney, recently translated from the see of London to Canterbury, having declared ten opinions which were stated to have been lately publicly preached among the nobles and commons of the realm heretical, and other fourteen erroneous, instructions were immediately despatched to the Bishops of London and Lincoln, enjoining them to take the most rigorous measures for the suppression of the said doctrines; and upon that letters mandatory were forthwith issued by the Bishop of Lincoln, charging all ecclesiastical functionaries throughout the archdeaconry of Leicester, within which the rectory of Lutterworth is situated, with the execution of this order. Soon after also a petition to the crown by the lords spiritual in parliament was answered by a royal ordinance, empowering the sheriffs of the counties to arrest all preachers of heresy, and detain them in prison till they should make satisfaction to the Church. But it is remarkable that, although many of Wycliffe's followers were apprehended and proceeded against under the powers thus granted to or assumed by the ecclesiastical and temporal authorities, he himself remained for a considerable time unmolested. He was cited to appear, among several other persons notoriously suspected of heresy, in an order issued by the synod at the Grey Friars to the chancellor of Oxford. It is supposed that the protection of the Duke of Lancaster, which, although not openly avowed, was probably as notoriously suspected as his heresy, sheltered his enemies from trouble. But in preaching in November 1382, instead of appealing to the king from the sentence which had imposed silence upon him, as he declared at the time he would do, addressed a long statement of his case, under the title of a 'Complaint,' to the king and parliament, in which he both reiterated in very vehement terms his general abhorrence of the church and the clergy, and avowed his continued disbelief of the doctrine of the real presence, which he affirmed had "been brought up by cursed hypocrites, and heretics, and worldly priests, unknowing in God's law"—he was immediately summoned before the convocation of the clergy assembled at Oxford to answer for these opinions. It is said that his old friend Lancaster, who had stood by him so long as he assailed merely the constitution of the hierarchy and the temporalities of the church, declined to go along with him now, when he had begun openly to attack the commonly received faith on the most sacred point of doctrine; and after advising him to retract, or at least to keep his sentiments to himself, openly withdrew his protection. The contemporary accounts however of this matter are very indistinct and unsatisfactory. All that is certain is, that Wycliffe appeared before the convocation, and gave in two written confessions or defences, the one in English, the other in Latin, in which he explained his opinions on the question of transubstantiation, not apparently without a considerable anxiety to give them as little of the air of a deviation from the common faith as possible. The account given by his enemy Knighton is, that "he did and said his answer hearing, put on the breastplate of dotage, attempted to disclaim his extravagant and fantastic errors, and protested that the follies he was called upon to answer for were basely and falsely ascribed to him by the malicious ingenuity of his enemies." The two confessions are entirely different. His apologist and admirer, Mr. Le Bas, describes the one in English as "a concise and tolerably perspicuous document;" the Latin one, which is very much longer, is also, he admits, "very much more defective in simplicity:" it is fenced about with all the forms of scholastic dialection, and is, as Mr. Le Bas thinks unintelligible. In both Wycliffe acknowledges that the sacramental bread is really and truly the body of Christ; but he does not, he says, affirm it to be the body of Christ essentially, substantially, corporeally, or identically. The result appears to have been that no sentence was pronounced by the convocation, that that soon after

Digitized by Google

letters were obtained from the king by which Wycliffe was debarred from teaching any longer in the university.

Wycliffe is supposed to have spent the remainder of his life in his parish of Lutterworth, where however his pen was more active than ever. His version of the Scriptures, the work which did perhaps more than anything else to undermine the influence of the Church of Rome in this country was probably, in part at least, published before this time. But the literary performances which he is commonly supposed to have produced after this date make an amount of composition which is entirely incredible in the circumstances. It is related that some time after he was driven from the university he was summoned to Rome to answer the charge of heresy by Pope Urban VI.: this appears to rest on nothing more than a letter of Wycliffe's, without date, addressed to his holiness, published by Lewis from a manuscript in the Bodleian, in which he says, "if I might travel in my own person, I would, with God's will, go to the pope. But Christ has needed me to the contrary, and taught me more obeish to God than to man." It is supposed that he had had an attack of paralysis before this time. He recovered partially, but found it necessary to hire another priest, John Purneye, to assist him in his parish duties, and also to act as his amanuensis. At last, while he was in his church hearing mass on Holy Innocents' day, the 29th of December 1384, just as the host was about to be elevated, he was thrown down by another violent fit of palsy, and he never spoke more, but died on the last day of the year. Forty years afterwards his doctrine was condemned by the Council of Constance, which also directed that his body should be exhumed and burnt. This was done, and the ashes were cast into the Swift, the little stream which flows along the foot of the hill on which the town of Lutterworth is built.

As for the particular opinions which Wycliffe held, it is not easy to say what they really were on various points, for two reasons: first, they were probably different at different times of his life; secondly, we are by no means certain whether many of the writings attributed to him are really his. But generally his views appear to have resembled those of Calvin more nearly than those of any other great leader of the Reformation of the 16th century. To some of the more peculiar doctrines of the Roman church he seems to have adhered to the end of his life: it may be doubted, for instance, if he disapproved of either pilgrimages or the worship of images; purgatory he evidently believed in to the last; and, what is not very easily reconciled with his repeated denunciations of the papal power as Antichrist, he addresses Pope Urban in the letter mentioned above as the greatest of Christ's vicars upon earth, and in the letter of his testiee, supposed to have been written shortly before, that entitled 'On the study of Scripture,' he describes it as being nothing less than paganism for a man to refuse obedience to the apostolic see. In his doctrinal theology he was a strong predestinarian and necessitarian. On the subject of church government he was an independent and voluntary of the most extreme description; opposed to episcopacy, opposed to establishments, opposed to endowments, holding that the clergy should be supported only by alms, and that every man should be as far as possible a church to himself. On the subject of his writings the reader should see what is said by Dr. Vaughan in his 'Life of Wycliffe,' by Dr. Todd in the preface to 'The Last Age of the Church,' and also in the preface to his edition of 'An Apology for Lollard Doctrines, attributed to Wiclife,' printed from a manuscript in the library of Trinity College, Dublin, for the Camden Society, 4to, London, 1842. Most of Wycliffe's writings, or supposed writings, still remain in manuscript. Of his translation of the Scriptures, the New Testament was printed first, by his biographer, the Rev. John Lewis, minister of Margate, in folio, in 1731; again in 4to, in 1810, under the care of the Rev. Henry Hervey Baber, of the British Museum; and, for the third time, in Bagster's 'English Hexapla,' 4to, London, 1841. 'The Holy Bible, containing the Old and New Testaments with the Apocryphal Books, in the earliest English versions made from the Latin Vulgate, by John Wycliffe and his followers,' was published by the University of Oxford in 1850 in 4 vols. 4to, under the editorship of the Rev. Josiah Forshall and Sir Frederick Madden, and contains the 'elder and later versions,' with the various readings, a very valuable introduction, and an excellent glossary.

(There is an account of Wycliffe in Fox's 'Martyrs,' which is worth little or nothing. There are also long articles about him in the first edition of the 'Biographia Britannica,' 1766, vol. vi., part 2, pp. 4257-4266; in 'British Biography,' 12 vols. 8vo, 1773, vol i., pp. 11-52; and in Chalmers's 'Dictionary,' 1817, vol. xxxii., pp. 27-38. The separate Lives, by the Rev. John Lewis (first published in 1719; for the last time, at the Clarendon Press, in 1820), by Dr. Robert Vaughan (1828, and edition, 1831, and in a revised form, 1853), and by the Rev. Webb Le Bas, 1832, have been mentioned above.)

WYKEHAM, WILLIAM DE or OF, was born at Wykeham or Wickham in Hampshire, in the year 1324, and, as his biographer Bishop Lowth has shown, some time between the 7th of July and the 27th of September. There is reason to believe that he did not take his name from his native village, the same name being borne by several of his relations living in his own day, who do not appear to have been born there. All that is certainly known about his father and mother is that their Christian names were John and Sibyl: if his father bore the name of Wykeham, he appears to have also passed by that of Long or Louge, and to have had an elder brother who was called Henry Asa. His parents are said to have been both, although poor, of creditable descent, as well as of reputable character.

He was put to school at Winchester, not by his father, who had not the means, but by some wealthy patron, who is traditionally said to have been Nicholas Uvedale, lord of the manor of Wykeham and governor of Winchester Castle. The tradition further asserts that, after leaving school, he became secretary to Uvedale; and that he was secretary to the constable of Winchester Castle is stated in a written account compiled in his own time. Afterwards he is said to have been recommended by Uvedale to Edyngton, bishop of Winchester, and then by those two friends to have been made known to King Edward III. There seems to be no reason for supposing that he ever studied at Oxford, as has been affirmed by some of his later writers of his life. It is evident indeed that he had not had a university education, and that he never pretended to any skill in the favourite scholastic learning of his age. His strength lay in his natural genius, in his knowledge of mankind and talent for business; and probably the only art and science he had much cultivated was architecture.

He is said in an ancient contemporary account to have been brought to court when he was no more than three or four and twenty, which would be about the year 1348; but the earliest office which there is the evidence of records for his having held is that of clerk of all the works at Windsor and in the manors of Henley and Yetlenden, his patent for which is dated the 10th of May 1356. On the 30th of October in the same year he was made surveyor of the king's works at the castle and in the park of Windsor. It is affirmed by a contemporary writer to have been at his instigation that Edward III. pulled down and rebuilt great part of Windsor Castle. Wykeham had the sole superintendence of the work. Queenborough Castle, in the Isle of Sheppy, was also built under his direction.

The king now began to reward him bountifully. He had probably taken deacon's orders at an early age; Lowth finds him described 'clericus,' or clerk, in 1352. It was not however till the 5th of December 1361 that he was admitted to the order of acolyte: he was ordained sub-deacon on the 12th of March 1362, and priest on the 12th of June following. Meanwhile his first ecclesiastical preferment, the rectory of Pulham in Norfolk, had been conferred upon him by the king's presentation on the 30th of November 1357. On the 1st of March 1359 he was presented by the king to the prebend of Flixton, in the church of Lichfield. On the 16th of April following he had a grant of 100*l.* a year from the crown, over and above all former appointments, till he should get quite possession of the church of Pulham, his induction into which living had been opposed by the court of Rome. On the 10th of July in the same year he was appointed chief warden and surveyor of the king's castles of Windsor, Leeds, Dover, and Hadlaug, and of the manors of Henley and New Windsor, Wishemer, and sundry other castles and manors, with the parks belonging to them. On the 5th of May 1360 he received the king's grant of the deanery of the royal free chapel or collegiate church of St. Martin-le-Grand, London. In October 1360 he attended upon the king at Calais, probably in quality of plenipotentiary, when the treaty of Bretigny was solemnly confirmed by the oaths of Edward and King John of France. Numerous additional preferments in the church, for which we must refer the reader to the elaborate detail given by Lowth, were heaped upon him in the course of the next three years. By June 1363 moreover he had been appointed to the office of warden and justiciary of the king's forests on this side Trent. On the 14th of March 1364 he had by royal grant an assignment of twenty shillings a day out of the exchequer. On the 11th of May 1364, he was made keeper of the privy seal, and soon after he is styled secretary to the king, or what we should now call principal secretary of state. In May 1365 he was commissioned by the king, with the chancellor, the treasurer, and the Earl of Arundel, to treat of the ransom of the King of Scotland (David II., taken at the battle of Neville's Cross in 1346), and the prolongation of the truces with the Scots; and not long after this he is designated, in a paper printed in the 'Fœdera,' chief of the privy council and governor of the great council, which phrases however Lowth supposes do not express titles of office, but only the great influence and authority which he then possessed. "There are several other preferments, both ecclesiastical and civil," adds Lowth, "which he is said to have held; but I do not mention them because the authorities produced for them are such as I cannot entirely depend upon. And, as to his ecclesiastical benefices already mentioned, the practice of exchanging them was so common that 'tis hard to determine precisely which of them he held altogether at any one time." There is extant however an account given in by himself on occasion of the bull of Pope Urban V. against pluralities, of the entire number and value of his church benefices, as the matter stood in the year 1366; and from this statement, in which Wykeham calls himself "Sir William of Wykeham, clerk, archdeacon of Lincoln, and secretary of our lord the illustrious king of England, and keeper of his privy seal," it appears that the total produce of those which he had held when the account was demanded was 873*l.* 6*s.* 8*d.*, and of those of which he remained in possession when it was given in, 842*l.*

All these inferior dignities however it is to be presumed that he resigned when, upon the death of William de Edyngdon, on the 8th

Digitized by Google

of October 1366, he was immediately, upon the king's earnest recommendation, elected by the prior and convent of Winchester to succeed him as bishop of that see. He was not consecrated till the 10th of October in the year following; but this delay, till an adjustment was effected of the conflicting pretensions of the royal authority and the court of Rome, was entirely occasioned, as Lowth has shown, only by a contention between the king and the pope as to which of them should have the largest share in Wykeham's promotion. Meanwhile he had been appointed by the king lord high chancellor of England; he was confirmed in that office on the 17th of September 1367.

He continued chancellor till the 14th of March 1371, when he delivered back to the king both the great and the privy seals, on the change of ministry made in compliance with a petition presented shortly before by the Lords and Commons, complaining of the mischiefs which had resulted from the government of his kingdom having for a long time been in the hands of men of the church, and praying that secular men only might be appointed to the principal offices both in the king's courts and household. There is no appearance however of this complaint being specially directed against any part of the conduct of the Bishop of Winchester, who assisted at the ceremony of constituting his successor in the chancellorship, and seems to have for years after this continued to retain both the favour of the king and the good will of the parliament, and even to have remained in habits of intimate and confidential connexion with the Duke of Lancaster, to whose influence the removal of the clergy from the offices of state is said to have been owing.

At this time the bishops of Winchester had no fewer than twelve different castles or palaces, all furnished and maintained as places of residence. Wykeham's first undertaking after he found himself in possession of the see was to set about a thorough repair of these episcopal houses. This cost him above 20,000 marks. He also applied himself with great zeal and diligence to the reformation of abuses in the monasteries and religious houses of all sorts throughout his diocese: the ancient house of St. Cross, at Froxfield, near Winchester, founded in 1132 by the famous Bishop Henry de Blois, brother to King Stephen, in particular engaged much of his attention, and the objects of the charity were indebted to his persevering exertions for the restoration of many rights and benefits which they had originally enjoyed, but of which they had been for a long time defrauded. But the object which from the first chiefly occupied him was his own great foundation of two colleges in which students might be educated "for the honour of God and increase of his worship, for the support and exaltation of the Christian faith, and for the advancement of the liberal arts and sciences." His preparatory college or school at Winchester was opened in 1373; and he had before this purchased most of the ground in the city of Oxford upon which his college there, still called New College, to which that at Winchester was designed as a nursery, was afterwards built.

These pious and patriotic exertions however were interrupted for a time by a political storm which rose against the bishop in 1376, the last year of the reign of Edward III. He had been appointed one of the council established to superintend the conduct of affairs on the petition of the parliament which met in the end of that year; and in consequence became a principal object of the resentment of the Duke of Lancaster and his party, who, after the death of the Black Prince in June, and the rise of the parliament in July, took possession of the unpermanented and dying king and proceeded to overthrow all the reforms that had been lately made in the government, and to effect, as far as they could, the ruin of all concerned in them. By the duke's contrivance eight articles were exhibited against the bishop at the beginning of the next Michaelmas term, charging him with various acts of pecuniary defalcation, oppression, and other sorts of misgovernment while he had been in office many years before as keeper of the privy seal and lord chancellor. He was heard in his defence, before a commission of bishops, peers, and privy councillors, about the middle of November, when judgment was given against him upon one of the articles, involving at the utmost a mere irregularity; and upon this, under the influence that then prevailed at court, an order was immediately issued for the sequestration of the revenues of his bishopric, and he was at the same time forbidden, in the king's name, to come within 20 miles of the court. The next parliament, which met on the 27th of January 1377, was wholly devoted to Lancaster; and when, soon after, on the petition of the Commons, an act of general pardon was issued by the king, in consideration of its being the year of his jubilee, the Bishop of Winchester alone was specially excepted out of its provisions. All this, in the circumstances of the time, may be taken as the best attestation to Wykeham's patriotism and integrity. His brethren of the clergy however assembled in convocation now took up his cause with great zeal; and, whether in consequence of their bold representations on the subject to the king, or for some other reason, it was soon deemed expedient to drop the proceedings against him, and on the 18th of June his temporalities were restored to him, on condition of his fitting out three ships of war for the defence of the kingdom and maintaining them at sea for a quarter of a year. And even from this mulct he was released on the accession of Richard II., a few days after. But the loss nevertheless to which he had been subjected by his prosecution is said to have amounted to 10,000 marks.

He continued to stand high in the favour and confidence of parliament during the minority of the new king. In 1380 he was one of a commission appointed on the petition of the Commons to examine into the state of the revenue and the kingdom, with full powers to call before them all persons who had been in office either during the current or the late reign. Again after the suppression of the insurrection of Wat Tyler and his followers, in the next year, the Bishop of Winchester was one of the seventeen persons proposed by the Commons to be appointed to confer with them on the condition of the kingdom: and on various occasions afterwards a similar tribute was paid to his popularity and weight of character. As soon as he was released from his troubles he hastened to apply himself anew to the carrying forward and completion of his new colleges. The business of teaching appears to have commenced both at Winchester and at Oxford in 1373; Pope Urban VI.'s bull of licence for founding Winchester College was granted 1st June 1378; the building of the College at Oxford, which he called 'St. Mary College of Winchester in Oxford,' was begun in 1380, and was finished in 1386; that of the college at Winchester was begun in 1387 and was finished in 1393. The papal bull confirming the statutes of the college at Oxford is dated 19th July 1398. And as soon as his two colleges were erected, he entered upon another work, which still remains a monument of his taste and munificence: he resolved to rebuild his cathedral in the greater part of its extent. This undertaking he commenced in 1395, and he just lived to see it brought to a close in about ten years after.

The Bishop of Winchester was one of the fourteen persons appointed in 1386, on the petition of the parliament instigated by the king's uncle, the Duke of Gloucester, to be a council to the king for one year, and in fact for that term to exercise all the powers of government. As soon as the parliament was dismissed, Richard made an attempt to break from the yoke thus imposed upon him; the commission and statute appointing the council were declared by the judges, on the royal command, to be illegal and null, and to have involved all who had been concerned in procuring them in the guilt of treason. Upon this the Duke of Gloucester and his friends raised an army of 40,000 men. Having encamped before London, they sent a deputation, of which the Bishop of Winchester was a member, to the king; the deputies were graciously received, and returned with proposals for an accommodation; but in the mean time a body of forces which had been raised for the king in Wales and Cheshire, under the command of his minion, the Duke of Ireland, was encountered by the Earl of Derby and a part of the army of the confederated lords at Radcott Bridge in Berkshire, and entirely defeated. This blow compelled Richard to yield for the present. But in May 1389, another revolution in the government was effected by the king suddenly declaring himself to be of age, and removing the Duke of Gloucester and his friends from the council-board. He did not however dispense with the services of the Bishop of Winchester, but, on the contrary, forced him again to accept the great seal. Wykeham remained chancellor till the 27th of September 1391, when he retired from office, Gloucester having by this time been restored to his place in the council, and all parties having been for the present again reconciled. In a great measure, it is probable, through the bishop's mediation. From this date Wykeham appears to have taken little or no share in public affairs. In 1397, when the Duke of Gloucester was put to death, and several of those who had joined him in taking arms in 1386 were attainted for that transaction, the Bishop of Winchester and others were, at the intercession of the Commons, declared by the king from the throne in parliament not to have been implicated in what their fellow-commissioners had done. Wykeham was present in the parliament held on the 30th of September 1399, when Richard was deposed, and also in the first parliament of Henry IV., summoned a few days after; but this was the last which he attended. He continued however in the active discharge of his episcopal duties for two or three years longer, and was able to transact business till within four days of his death, which took place at South Waltham, about eight o'clock on the morning of Saturday the 27th of September 1404.

(*Life*, by Robert Lowth, D.D., 2nd edition, 8vo, London, 1754.)

WYNANTS, JOHAN, one of the best of the Dutch landscape-painters, was born at Haarlem about the year 1600. Little is known about him; he is not mentioned by Houbraken; and Van Gool, who notices this omission of Houbraken, lived at too late a period to be enabled to learn any facts of his life. Wynants is supposed to have been the master of Wouverman, to whom some of his pictures have been attributed. He was fond of amusement, and idled much of his time in parties of pleasure, and his pictures accordingly few in number. He generally painted small pictures, coloured with great transparency: the figures and cattle in them are not painted by himself; a fact, says D'Argenville, which Wynants endeavoured to keep a secret. These parts of his pictures were painted by several masters—by Van Thulden, Ostade, Wouverman, Lingelbach, and A. Vandevelde, which gives an additional value to his works. In Pilkington's 'Dictionary' and some other books, 1670 is given as the date of Wynants' death, but there is a picture in the gallery of Schleissheim by him, dated 1673: his name is also written in the painters'-company's book of Haarlem for the year 1677. (D'Argenville, *Vies des Peintres;* Dillis, *Gemalde zu Schleissheim.*)

WYNDHAM, SIR WILLIAM, the third baronet of that name,

Digitized by Google

distinguished in the parliaments of Queen Anne and the first two Georges, was born in 1687. He was of an ancient family in Somersetshire, and succeeded at an early age to the title and estate. He was educated at Eton and at Christchurch, Oxford, and afterwards travelled for some time abroad. On his return he was chosen to represent his native county in parliament, and married a daughter of the Duke of Somerset. He thus entered upon public life with great advantages, which his abilities well supported. He associated himself with the Tory party, and, fascinated by the talents of Lord Bolingbroke, he joined in the pleasures as well as the politics of that nobleman.

When the Tory ministry was formed under Oxford and Bolingbroke in 1710, Wyndham was made master of the buckhounds, and on the 18th June 1711, was appointed secretary-at-war. In August 1713 he was promoted to the office of chancellor of the exchequer, and in November was sworn a privy councillor. In the dissensions between Oxford and Bolingbroke he sided with the latter, and was entirely in his confidence. When the lord high treasurer was disgraced, Lord Bolingbroke wished to have the treasury put in commission, and proposed Wyndham as one of the five commissioners; but this arrangement was defeated by the sudden appointment of the Duke of Shrewsbury to the vacant office. This appointment, followed by the death of the queen, put an end to the hopes of the Tory party. The suspicion of a treasonable correspondence with the Pretender had attached to many of the Tory ministers, and to none more than to Lord Bolingbroke. Wyndham himself was not free from suspicion; his intimacy with Lord Bolingbroke and his close friendship with other reputed Jacobites having pointed him out as one requiring to be watched. He was returned to the new parliament summoned by George I., and protested in such strong language against the proclamation by which the late parliament had been dissolved, that he was only saved from imprisonment in the Tower by Sir Robert Walpole, who persuaded the House of Commons to spare him with a reprimand from the Speaker. When the rebellion in favour of the Pretender broke out in 1715, intelligence was brought to the privy council that Sir W. Wyndham was concerned in a plot to seize Bridgewater in Somersetshire: his father-in-law the Duke of Somerset offered to be responsible for him, and desired that he might not be taken into custody; but the council refused to leave him at large, and sent Colonel Hasker to arrest him. Sir William, on being taken at his own house, contrived to escape under pretence of making preparations for his journey to London; and a proclamation was immediately issued offering 1000*l.* for his apprehension. For some time he eluded the vigilance of his pursuers, disguised as a clergyman, but finding that he had little chance of escape, he surrendered himself, and was committed to the Tower. He denied all knowledge of any design whatever in favour of the Pretender; and, whether on account of his innocence, the failure of evidence, or the influence of his connections, he was never brought to trial.

He was henceforth distinguished as one of the most active and able members of the opposition. He opposed Sir Robert Walpole almost every occasion. The most prominent and perhaps the best speech against Walpole's Excise scheme was delivered by him in 1733. Of all his reported speeches, that in favour of the repeal of the Septennial Act in 1734 may be pronounced the most able and argumentative. In 1739, having been in the minority who voted against the address of the Spanish convention, he determined, with many others, to secede from parliament. In expressing this resolution he applied insulting terms to the majority of the House, and was indebted, for the second time, to Sir Robert Walpole's judicious forbearance for his escape from commitment to the Tower. Nothing could have been more absurdly impolitic than the retirement of the opposition from all further contest in the House of Commons: it had been suggested by Lord Bolingbroke, whose counsels were often more mischievous than wise; and the mistake was so evident, that the seceders all returned on the first day of the next session.

The influence of Wyndham in the House of Commons was proved by the immediate consequences of his death in 1740. He had united the Tories and a considerable party of Whigs in their opposition to Sir Robert Walpole. At that decisive moment the whole opposition was disarmed of half its power—and for some time the minister had little to dread either from the eloquence or the numbers of his opponents. He died at Wells in Somersetshire, July 17, 1740, and was succeeded by his son, Sir Charles Wyndham, who afterwards inherited the title of Earl of Egremont from his uncle the Duke of Somerset. By his second wife, relict of William, Marquis of Blandford, he left no issue.

Sir William was one of the most popular men of his day, and in parliament was remarkable for the force and spirit of his eloquence. The character of his oratory has thus described by a great critic, Mr. Speaker Onslow: "There was much grace and dignity in his person, and the same in his speaking. He had no acquirements of learning; but his eloquence, improved by use, was strong, full, and without affectation, arising chiefly from his clearness, propriety, and argumentation; in the method of which last, by a sort of induction almost peculiar to himself, he had a force beyond any man I ever heard in public debates. He had not the variety of wit and pleasantry in his speeches so entertaining in Daniel Pulteney; but there was a spirit and power in his speaking that always animated himself and his hearers, and, with the decoration of his manner, which was indeed very ornamental, produced not only the most attentive, respectful, but even a reverend regard to whatever he spoke."

WYNTOUN, ANDREW, a rhyming annalist, lived during the early part of the 15th century, and was prior of the monastery of St. Serf's Inch or Island, on Loch Leomond in Scotland. Nothing has been discovered as to his parentage or the periods of his birth and death, and he is only known as the author of 'The Orygynale Cronykil of Scotland,' a work of considerable authority in Scottish history during the interval between the commencement of the 11th and that of the 15th century. It is valuable also as a specimen of the Scottish language at a time when it closely resembled the English in all but the Gallicisms which pervade Chaucer and Gower, and before it had taken that distinct provincial form which it exhibits in the Scottish poets of the latter part of the 15th and of the 16th century. Wyntoun seems to have strongly felt the difficulty under which all rude chroniclers lie, of drawing a line of demarcation between the domestic and the foreign. The work is divided into nine books:—

> "In honoure of the crdrys nyne
> Of haly angelys, the quhilk dwynne
> Scripture lowys, ou lyk wys
> I wylle depart now this tretis-
> In Nyne Bukis, and noucht ma;
> And the fyrst Buke of tha
> Sall trete fra the begynnyng
> Of the warlde."

Accordingly the author is as good as his word, and, beginning at the Creation, he passes through the greater part of Scripture history to the mythological period of Greece and Rome, mingling the sacred and profane strangely together, and describing both the deluge of Scripture and Deucalion's flood. The second and completer fabulous part of the Scottish annals is mixed up with these widely-dispersed chronicles. Four books out of the nine are finished before the birth of Christ is narrated. In the printed edition of the chronicle the editor has very properly given only the rhythmical titles of the chapters which do not refer to Scotland, and time of these four books only a few fragments are printed. Wyntoun is a tedious narrator, but he is spirited in his descriptions; and the stirring events he has to record, with the curious traditions of national superstition mingled with them, give the book considerable animation. Sir Walter Scott has been obliged to Wyntoun for many striking incidents in his marvellous poetry.

There are several manuscripts of Wyntoun's Chronicle; one in the Cottonian collection, another in the Harleian, and a third in the Advocates' Library. The best is however that in the Royal Library in the British Museum, from which Mr. David Macpherson edited the printed edition, collating it with the others. This magnificent specimen of British typography was printed in 1795, in 2 vols. 8vo. All the copies of it seem to have been printed on drawing-paper; at least the writer of this notice has never met with any copy on ordinary paper. It contains an introduction, notes, and a glossary.

WYON, WILLIAM, an engraver and designer of medals and coins, was born at Birmingham in 1795. The pursuits and associations of his family (of German descent) were peculiarly calculated to give direction to his mind and to foster whatever natural abilities he possessed. His grandfather, George Wyon, engraved the silver cup embossed with a design of the assassination of Julius Cæsar, which was presented by the city of London to Wilkes. His father, Peter Wyon, to whom, in 1809, William was apprenticed, was a die sinker of reputation at Birmingham, and with him was associated William's uncle, Thomas, as partner, to whom Peter Wyon was much indebted. The earliest of his productions of which we find any marked notice were copies of the heads of Hercules and of Ceres; the latter won the gold medal of the Society of Arts, and was purchased by it for distribution as an agricultural prize. A second gold medal from the same body marked the appearance of Wyon's groups—Victory drawn by Tritons. A few years later he completed a figure of Antinous, which so delighted his father, that he had it set in gold, and wore it constantly until his death.

Wyon came to London in 1816, and won his way through a competition to the post of second engraver at the Mint. Sir Thomas Lawrence was the umpire, and the trial piece the head of George III. His prospects were now most favourable, and his situation altogether agreeable to him—for the chief engraver, Thomas Wyon, was his friend and cousin. But unexpectedly the latter died, and Mr. Pistrucci was nominated in his place. The new engraver and his chief assistant could not agree. Pistrucci, a skilful artist, is said to have been indolent, and while reserving to himself the greater share of the honour and emolument, to have left the greater amount of labour to Wyon. Under a new Master of the Mint these differences were compromised by an arrangement, which left Pistrucci nominally chief engraver until his death, but gave half his salary to Wyon. We need not dwell on the literary wars that arose out of these occurrences, further than to observe that the younger man found an enthusiastic champion who issued a memoir of his life, and a list of his works, then exceeding two hundred in number. The Royal Academy marked its opinion of this controversy, and of Wyon's own merits, by electing him in 1832, an Associate, and in 1838 an Academician, the first of his department who had ever obtained these honours.

Digitized by Google

Wyon's works may be divided into coins—pattern pieces of coins not used—medals, and seals. His coins include those of the later years of the reign of George IV., all those of William IV., and all those of her present Majesty which appeared in Wyon's lifetime. He followed Chantrey's models in the coins of both the kings, but was his own designer in the coins of Victoria. The pattern pieces include one of ten pounds for William IV., and one of five pounds (among several others) for the present Queen, which bore a figure of Una on the reverse. These pattern pieces did not become coins through the influence of the body, who, at that time, under the title of moneyers, were the privileged coiners of the country, and who knowing that increased expense would be necessary, took care of their profits, and did not trouble themselves about Wyon's disappointment or the interests of art. His medals include a great range of subjects, and were produced for many different and admirable objects. There are war medals for the Peninsular victories, for Trafalgar, for Jellalabad and Cabul; scientific medals for the Royal Society, Royal and London Institutions, Geological, Geographical, and similar societies, native and foreign; artistic medals, as for the Royal Academy and Art Unions; educational, as for Harrow, a gift by Sir Robert Peel; and testimonial, as in the case of the Brodie medal, which bore a head of the man in whose honour it was struck. Most of these medals have for their obverses heads taken from the antique, a few modern, and in some cases, then living personages; and the author had generally aimed, as a matter of course, at a characteristic fitness between the portrait and the accompanying circumstances. Thus, Cicero adorned the Peel-Harrow medal, while heads of Lord Bacon, Sir Isaac Newton, Dr. Wollaston, and Sir Francis Chantrey, were respectively and appropriately connected with the medals of the Royal Institute, the University of Glasgow, the Geological Society, and the Art Union. Many—and among them some of the best—of the reverses were from his own designs; while for others Wyon was indebted to Flaxman, for whom he had an enthusiastic veneration, Howard, and Stothard, who contributed the reverse to a medal of Sir Walter Scott. Wyon's increasing eminence was shown in the various commissions he received from foreign countries; we may especially mention his engagement for a series of Portuguese coins.

The characteristics of Wyon are the combination of two (often opposing) qualities, strength and delicacy, with the indispensable merit of likeness in his portraitures; taken for all in all, we have had no such medal engraver since the days of Simon, the artist who shed so much lustre on this department in the days of the Commonwealth. Wyon died at Brighton, October 29, 1851, in his fifty-seventh year, leaving a son, Leonard, who having aided him in his lifetime, inherited much of his skill at his death. To the latter we owe the well-known medal of Wordsworth; and his name is honourably remembered in connection with the awards of the Great Exhibition; and is thus gratifyingly associated in art as in blood with the subject of our present notice, whose latest works were in commemoration of that same assemblage of the world's industrial and artistic fruits.

WYTHER, GEORGE. [WITHER.]

WYTTENBACH, DANIEL, was born in 1746, at Bern, where his father, Daniel Wyttenbach, was then pastor. His father distinguished himself by several theological works, and died, in 1779, being then professor of theology in the University of Marburg. Young Wyttenbach studied philology at Marburg, Göttingen, and Leyden, and in the last place he was one of the pupils of Ruhnken, to whom he became particularly attached. In 1771 he was appointed professor of Greek and philosophy in the Athenæum of Amsterdam, which is now called after him the Wyttenbach Athenæum. From Amsterdam he was transferred in 1779, to the chair of eloquence in the University of Leyden, of which he and Ruhnken were the most illustrious scholars. He remained in this office for a great number of years, until the infirmities of old age and blindness compelled him to withdraw from his functions. In 1816, at the age of seventy, he went to Heidelberg, where, for a short time, he abstained from literary exertions. Two years later he married Johanna Gallien, a woman of great acquirements and talent, who distinguished herself as a writer, and was created, in 1827, doctor of philosophy by the university of Marburg. From 1818 Wittenbach had withdrawn from all public functions, and weighed down by old age and the loss of his sight, he died at Oegs, on the 17th of January 1820. Wyttenbach was one of the greatest scholars of whom the University of Leyden can boast; he possessed extensive and refined learning and great critical skill. He always wrote in Latin. His Latin composition, especially his 'Vita Ruhnkenii,' is among the best modern specimens of that language, both for purity and elegance. We are indebted to Wyttenbach for some excellent editions of ancient authors. The most important among them are:—1, Tho 'Opera Moralia' of Plutarch, 6 vols. 4to, and 12 vols. 8vo, Oxford, 1795–1800. This is the best and most valuable portion of Plutarch's works. 2, 'Selecta principum historicorum, Herodoti, Thucydidis, Xenophontis, Polybii, Phalaridis et viri Demosthenis et Ciceronis,' with very useful notes, 8vo, Amsterdam, 1794. New editions appeared in 1808, and at Leyden, 8vo, in 1829. From 1779 to 1808 Wyttenbach edited the 'Bibliotheca Critica,' 12 vols. 8vo, Leyden. His smaller essays were collected after his death under the title 'Opuscula varii Argumenti, Oratoris, Historici, Critici,' 2 vols. 8vo, Leyden, 1821. His Life of Ruhnken is printed in Fr. Lindemann's 'Vitæ Dunnvirorum doctrina et meritis excellentium,' together with Ruhnken's Life of Hemsterhuis, 8vo, Leipzig, 1822. Wyttenbach's correspondence with the most eminent scholars of the time has been edited by W. F. Mahne (3 parts, 8vo, Ghent, 1829–30), who has also written a very good Life of Wyttenbach ('Vita Wyttenbachii'), which forms part 1 of vol. ii. of Fr. Tr. Friedemann's 'Vitæ Hominum quocunque Literarum genere eruditissimorum ab eloquentissimis Viris scriptæ,' 8vo, Brunswick, 1825, &c.

X

XANTHUS (Ξάνθος), one of the early Greek historians, was, according to Suidas, a son of Candaules, and born at Sardes. Strabo (xiii. p. 628) admits, with other writers, that Xanthus was a Lydian, but he says he is not known as a writer of Lydian history. But this is not true in which he lived, we know, from a fragment of Ephorus, that he was older than Herodotus, who is even said to have been induced by Xanthus to undertake his great historical work. But it appears that Xanthus cannot have been much older than Herodotus, since Dionysius of Halicarnassus mentions him among those writers who lived shortly before the Peloponnesian war, and from one of Xanthus's own fragments it is clear that he wrote his work in the reign of Artaxerxes I., who reigned from before B.C. 465 to 425. The statement of Suidas, that he was born about the time of the taking of Sardes (by the Ionians, in B.C. 499), also agrees with these facts. Xanthus wrote a work on Lydia (*Λυδιακά*), in four books, in the Ionic dialect, of which however only a few fragments are extant, which are preserved in Strabo and other writers. The genuineness of these fragments has been the subject of much discussion, because Athenæus (xii. p. 515) states, on the authority of Artemon of Cassandrea, that Dionysius surnamed Scythobrachion forged a work on Lydia under the name of Xanthus. But in the first place, the existence of Xanthus the historian cannot be doubted, and secondly, most of the fragments which are preserved under his name bear the strong internal evidence of being genuine; and lastly, there are scarcely any that can be declared spurious with certainty. Dionysius of Halicarnassus, who appears to have had the work of Xanthus before him, speaks of it with high praise, and calls the author a man most intimately acquainted with the ancient mythological history, and not inferior to any of those who had written on Lydia. So far as we can judge from the extant fragments, which contain valuable information on various points, especially the history and geography of Asia Minor, the work of Xanthus seems to have been one of great merit. One Menippus, of uncertain date, made an abridgment of the work of Xanthus. (Diog. Laert, vi. 101.) The fragments of Xanthus's 'Lydiaca' are collected in Creuzer's 'Historicorum Græcorum antiquissimorum Fragmenta,' p. 191, &c., and in C. and Th. Müller's 'Fragmenta Historicorum Græcorum,' p. 36, &c. Some ancient authors attribute to Xanthus a work on the Magi and the religion of Zoroaster, but the fragments which are quoted from it leave no doubt that this work was the production of some late grammarian.

(*Museum Criticum*, vol. i., pp. 80, 216; Creuzer, in the work cited above, p. 135, &c.; C. and Th. Müller, p. 20, &c.; Welcker, in Seebode's *Archiv für Philol.* for 1830, p. 721.)

XAVIER, FRANCIS, SAINT, was born at the castle of Xavier, in Navarre, the 7th of April 1506. His father, Don John de Jasso, was counsellor of state to the King of Navarre, and his mother, Maria Azpilcueta, was heiress of the two illustrious houses of Azpilcueta and Xavier. Francis was the youngest of a large family of children, the eldest of whom bore the surname of Azpilcueta, and the others that of Xavier. Under the paternal roof he received all the advantages of a careful education. His devotion to study, and the talents which he manifested, induced his parents to send him at the age of eighteen to the Collège de Sainte Barbe, at Paris. It was there that he first became acquainted with Ignatius Loyola, and thenceforward to the time when he set out on his missionary labours, the history of Xavier is intimately blended with that of Loyola and his disciples. [LOYOLA, IGNATIUS.]

In 1538 he joined Ignatius Loyola at Rome, where he actively assisted him in the furtherance of his great design of associating a body of devoted men for the special service of the Church of Rome. While in that city, he exercised the functions of the ministry in the church of St. Lawrence in Damaso, and attracted to it large multitudes by his zeal and talents. Among them was a Portuguese of the name of Govea, who had been sent to Rome on a mission of importance by King John III. In his communications with the king he had expressed himself in terms of high commendation of the new society which had lately sprung up under Loyola; and had suggested the propriety of selecting missionaries from among them to plant the standard

Digitized by Google

of the faith in the Portuguese colonies of Asia. Influenced by these representations, the king despatched an order to his ambassador at Rome to obtain six members of that society, who might be willing to devote themselves to missionary labours. Two only however could be spared, and Simon Rodriguez, a Portuguese, and Nicholas Bobadilla, a Spaniard, were selected by Loyola. As he was absent to set out on his journey to Lisbon, Bobadilla fell sick, and Francis Xavier joyfully received the command of his chief to become his substitute. Having previously obtained the benediction of the Pope, Paul III., on himself and his holy enterprise, he left Rome in company with the Portuguese ambassador, on the 15th of March 1540. Their journey by land to Lisbon was long and tedious. At Brundisium, through the town of Pampeluna, which was only eight leagues from the castle of Xavier, he was pressed by the ambassador to take leave of his mother, who was still living, and his other friends and relations, whom it was probable he might never again see. In the excess however of his zeal for the prosecution of the purpose to which he had devoted himself, he declined availing himself of the opportunity, fearing, as he said, that the transient pleasure of a last farewell might leave too lasting an impression of melancholy on his sacred enterprise.

Xavier and his companions arrived at Lisbon towards the end of June. After a stay of eight months in Lisbon, on the 7th of April 1541, Xavier embarked on board a vessel, which carried Don Martin Alphonso de Souza, governor of the Indies, but unaccompanied by Rodrigues, who had been persuaded by the king to remain in Portugal. After a voyage of five months, they arrived at the coast of Mozambique in Africa, where they wintered, and at Goa, the Portuguese seat of government in the East Indies, on the 6th of May 1542.

On landing, the first visit of Xavier was to the hospital; his next to his spiritual superior, the Bishop of Goa, to whom he presented the briefs of Paul III., and implored his sanction and blessing on his missionary enterprise. He had scarcely commenced it, when he made the painful discovery that the doctrines in which he was anxious to instruct the infidels, were openly contradicted by the life and example of the greater part of the Christian residents in Goa. To their spiritual reformation therefore he directed his first endeavours; going from street to street, with a bell in his hand, he summoned every inhabitant to send him his children and slaves, in order that they might receive Christian instruction. Having secured his influence over the young, he exerted himself in his ministrations to expose the prevailing vices, and to present the remedies which religion affords. From the Christians, his zeal extended itself to the infidels, whose temples he caused to be destroyed, and churches to be erected on their site. His labours were speedily rewarded in Goa by a marked reformation among the inhabitants. After a residence of three months in that town, he left it to visit the coast of the pearl fishery, which extends from Cape Comorin to the isle of Manar. He there found that, although a large proportion of fishers had been baptised in the Christian faith, they had, for want of instruction, retained the vices and superstitions of heathenism. In order to give them that instruction, he laboured for some time most assiduously in acquiring the Malabar language. His first preaching among them was attended with extraordinary success. After a stay of fifteen months on this station, he returned to Goa for the purpose of procuring assistants to his work; with them he returned, in 1544, to the fishery on the coast, and left several of them in different parts, to prosecute the labours which he had begun. He then proceeded to the kingdom of Travancore, where, in one month, as he states in his letters, he baptised ten thousand Indians.

Xavier then visited Malacca, a place at that time of considerable trade, and to which merchants from every part of Asia were in the habit of resorting. He arrived there on the 25th of September 1545, and, according to his custom, took up his residence at the hospital, where he devoted himself to the service of the sick, without neglecting the principal object of his mission, which was to instruct the people. A large number of converts from among Mohammedans, Jews, and others, was the result of his labours. While at Malacca he was joined by three other Jesuit missionaries, whom Ignatius Loyola had sent to co-operate with him. In company with them, on the 1st of January 1546, he set sail for the islands of Banda, and it is said, became the happy instrument of the conversion of the entire crew of the vessel which carried him. From thence he proceeded to the island of Amboyna, where he baptised a large number of the inhabitants; he then preached the Gospel in other islands, and, having made a considerable stay in the Moluccas, he brought over great numbers to Christianity. Xavier then returned towards Goa, visiting on his voyage the islands where he had planted the faith: he arrived at Malacca in 1547. After leaving Malacca he made some stay at Manassy, near Cape Comorin, and afterwards passed over to the island of Ceylon, where he converted the King of Candy and several of his subjects; on the 20th of May 1548, he returned to Goa. At Malacca, he had met with a Japanese exile, named Anger, of noble birth and high station in his country, whom he had instructed in the faith, and induced to accompany him to Goa. The description given by this Japanese of the state of his native islands determined Xavier on making them the next object of his missionary labours. Having baptised Anger, with two of his domestics, and given him the more Christian name of Paul of the Holy Faith, he set out with him from Goa on this difficult enterprise.

After making a short stay at Malacca, he embarked on board a Chinese vessel, and arrived on the 15th of August 1549, at Cangoxima, in the kingdom of Saxuma, in Japan.

The chief difficulty he had to overcome in this new mission was his ignorance of the Japanese language. Xavier, during his voyage, had, by means of his convert, acquired some little knowledge of it, which was increased by his stay of forty days at Cangoxima, and which was sufficient to enable him to translate into it the Apostles' creed with a short exposition. The little progress however which he made in it proved a serious hindrance to his success, as appears from the letters he sent home. Through his companion, he was introduced to the king of Saxuma, who gave him a favourable reception, and listened hearing him on the subject of religion. In the hope of finding a more suitable field for his missionary exertions, he left Saxuma, and proceeded to Firando, the capital of another small kingdom. He was there allowed freely to exercise his ministry, and numerous conversions were the fruits of it: in that city he baptised more infidels, in twenty days, than he had done at Cangoxima in a whole year. Encouraged by this success, he left these converts under the care of one of the Jesuits who had accompanied him, and set out for Meaco, the capital of the whole empire and the residence of its ecclesiastical chief. On his way thither he visited Amanguchi, the principal town of the kingdom of Nangato, where he was allowed to preach in public and before the king and his court, but with little success. After a month's stay in that city, he continued to journey towards Meaco. Though it was the depth of winter, and the whole road, difficult at all times, were now rendered almost impassable by drifts of snow and mountain torrents, yet, thinly clad and barefoot, he journeyed onwards, resigned and cheerful. He arrived at Meaco in February 1551, having been about two months on his journey. There his mean appearance and unpolished manners proved a subject of offence to the inhabitants; accustomed to the gorgeous rites and pompous ceremonial of their own religion, the priests, whose influence was paramount in that city, could not see in this humble person the ambassador of the Most High. Though rejected with contumely, Xavier did not abandon his purpose, but returned to Amanguchi, where he provided himself with a rich suit and a retinue of attendants, and thus attired presented himself before the court. This harmless device produced the desired effect; he obtained the protection of the king, and preached with so much success, that he baptised two hundred persons in that city. These converts he left to the care of some Jesuits who had been the companions of his journey; and, accompanied by two Japanese Christians, who, rather than renounce the consolations of the religion he had taught them, had cheerfully suffered the confiscation of their property, he departed from Amanguchi, in September 1551, and, the 20th of November following, embarked to return to India, having remained in Japan two years and four months. This mission was, for upwards of a hundred years after the death of Xavier, successfully continued by the Jesuits. On his voyage he made some stay at Malacca, chiefly for the purpose of concerting measures with the governor of that place for the prosecution of a mission to China. A serious obstacle to it was the law which forbids strangers, on the severest penalties, to enter that country. To remove it, it was agreed between Xavier and the governor of Malacca that an embassy should be sent in the name of the king of Portugal to establish a commercial treaty, and that Xavier should join it. On his return however to Malacca, he found the new governor, who had arrived there during his absence, opposed to the projected embassy, and, after many unavailing entreaties to procure his compliance, he was obliged to embark alone for his intended mission on board a Portuguese vessel bound for the island of Sancian, near Macao, in China, a place where the Chinese were permitted to traffic with the Portuguese merchants. On arriving there, the merchants of Sancian endeavoured to dissuade him from his design of prosecuting his journey further, and strongly represented to him the danger. Xavier however was not to be deterred; he provided himself with an interpreter, and entered into an agreement with a Chinese merchant to land him by night on some part of the coast. This plan was also frustrated by the Portuguese residents of Sancian, who feared that this attempt to infringe the laws might be visited upon them by the vengeance of the Chinese authorities. While thus disappointed in his fondest hopes, he fell seriously sick. His sufferings, which were most acute, were aggravated by the inattention and want of skill of those around him; in the midst of them however he displayed a cheerful countenance and a pious resignation. He died on the 2nd of December 1552. His remains were brought over to Malacca on the 22nd of March 1553, where they were received with the greatest honour; they were afterwards transferred to Goa, and deposited in the principal chapel of the church of Paul, on the 15th of March 1554. The memory of Francis Xavier was consecrated by a ceremony known in the Church of Rome by the name of Beatification, by the Pope Paul V., in 1619, and he was canonised as a Saint by Gregory XV. in 1622. In 1747, John V. king of Portugal, obtained a brief of Benedict XIV., which conferred on him the title of patron and protector of the East Indies. His festival is observed by the Church of Rome on the 3rd of December.

The following works are all that Francis Xavier has left:—1, A Collection of Epistles, in five book, Paris, 1631, in 8vo; 2, A Catechism; and, 3, 'Opuscula.'

(Alban Butler, *Lives of the Fathers, Martyrs, and the other principal Saints*, vol. xii. p. 29-40, Derby, 1846; in this biography there is an error in the date both of his beatification and canonisation; *Biographie Universelle*, tome ii.; the article 'Xavier' in which he is by Léguy; Fabre, *Continuation de l'Histoire Ecclésiastique de Fleury*, livres cxxxv., cxxxix.-cxli., cxliv.-cxlviii.; *Lettres édifiantes et curieuses, écrites par des Missionnaires de la Compagnie de Jesus*, 40 vols., Paris, 1832, vol. xxvii., a work of great curiosity and interest, and not sufficiently known in England. The Life of St. Francis Xavier has also been written in Latin, by Turselinus, Rome, 1594; in Italian, by Orlandino, Bartoli, and Maffei; and in French, by Bouhours, a work which was translated into English by Dryden in 1688.)

XENOCRATES (*Ξενοκράτης*), a native of Chalcedon, was born B.C. 396. He was originally a pupil of Æschines, the Socratic philosopher, and then of Plato. The few facts of his life are chiefly known from the loose account of Diogenes Laertius. According to Diogenes he accompanied Plato to Sicily. Xenocrates was naturally of a slow understanding, which led Plato to say that Xenocrates required the spur, but Aristotle the bit. His temperance was proof against all temptation, and there are stories of his successfully resisting all the solicitations of Lais and Phryne. A story is also told of the Athenians allowing him to give his testimony without oath, though it was the universal practice to require a witness to take an oath. It does not seem very consistent with this story that he should have been once sold for a slave by the Athenians, because he could not pay the tax which was imposed on the metœci, or resident aliens. Demetrius Phalereus, it is said, paid the tax and released him; this last part of the act is also attributed to the orator Lycurgus. Other accounts of his having been sent by the Athenians as ambassador to King Philip, and to Antipater after the Lamian war, are hardly more credible. He succeeded Speusippus B.C. 339 in the Academy, of which he was at the head for twenty-five years. He died B.C. 314. A long list of his writings is given by Laertius.

We know little of the doctrines of Xenocrates, but it may be inferred that he exhibited his opinions in a systematic form, and not in dialogues like his master Plato. To him is attributed the division of philosophy into Logic, Ethic, and Physic (Physics). He principally occupied himself with attempting to reduce the ideal doctrines of Plato to mathematical elements. He assumed three forms of Being (*οὐσία*)—the sensuous, that which is perceived by the intellect, and that which is compounded of both of these opinions. In his account we see the tendency of the Academy towards the Pythagorean doctrines of number. Unity and duality he considers as the gods which rule the world, and the soul as a self-moving number. Other like conceits are attributed to him. Xenocrates considered that the action of the Deity pervades all things, and is even in the animals which are called irrational. He also admitted an order of dæmons, or something inter mediate between the divine and the mortal, which he made to consist in the conditions of the soul. In his ethical teaching he made happiness consist not in the possession of a virtuous mind only, but also of all the powers that minister to it and enable it to effect its purposes.

The dialogue 'Axiochus' (On Death), which is usually assigned to Æschines, has been sometimes attributed to Xenocrates.

It seems almost impossible to form out of the scattered notices of Xenocrates anything like a connected view of his system; and what we can learn of it is not calculated to make us regret the loss of his works. An anecdote in Laertius is pertinent, as showing that he did not expect a person to come to the study of philosophy without the necessary preparation. A young man unacquainted with music, geometry, and astronomy, wished to become his pupil, but Xenocrates told him to be gone, for he had not yet got hold of the handles of philosophy.

(Diogenes Laertius, iv., *Xenocrates*, and the *Notes* of Menage; Ritter, *Geschichte der Philosophie*, vol. ii.)

XENOCRATES of Aphrodisias, a Greek physician, who is commonly supposed to have lived in the reign of the emperor Tiberius (A.D. 14-37), though some critics are inclined to place him about A.D. 40, but the only authority on this point is a passage in Galen (tom. iii. p. 130) which strongly supports the common opinion. Respecting the life and literary activity of Xenocrates we know nothing except that he wrote a work, *Περὶ τῆς ἀπὸ τῶν ζώων ὠφελείας καὶ τροφῆς* (On the Advantages or the Nutriment derived from Animals); Galen, tom. ii. p. 132; Clemens Alexand., 'Stromat.,' i. p. 717. This work, which is often referred to, and must have consisted of several books, as the first is quoted by Galen, is now lost, but a considerable fragment of it, which treats of the nutriment which we derive from aquatic animals (*Περὶ τῆς ἀπὸ τῶν ὑδάτων τροφῆς*), is still extant, and contains many sound observations on this branch of natural history. A Latin version of this fragment is contained in Oribasius ('Collectanea Medica,' ii. 53); the Greek original, though not quite complete, was first published by Conr. Gesner, with a Latin translation by J. B. Rasarius, and Scholia, 8vo, Zürich, 1559. More complete manuscripts exist at Hamburg, in the Vatican library, and at Paris, and from them the subsequent editors have completed the text of the treatise. The next edition after that of Gesner is that of J. A. Fabricius, in his 'Bibliotheca Græca' (ix., p. 433, &c. of the old edition), which was followed by that of J. G. F. Franz (8vo, Frankfort and Leipzig, 1774, with various readings, notes, and a glossary; a second and improved edition appeared at Leipzig, 8vo, 1779), and that of Naples (8vo, 1791, with new various readings and notes by the editor Caistanus de Ancora). The best critical edition of the Greek text is that of A. Cory (8vo, Paris, 1814), which also contains Galen's work on the same subject. It is Cory's opinion that the author of the work 'On the Nutriment derived from Animals' is not the physician Xenocrates, but the philosopher Xenocrates.

XENOPHANES (*Ξενοφάνης*), a native of Colophon in Ionia. His period is uncertain. Diogenes says that he flourished in the 60th Olympiad (538 B.C.), which will bring him somewhat about the period of Anaximander. Cicero says that he was a little before Anaxagoras. Apollodorus fixes his birth in the 40th Olympiad, or about 620 B.C. Clitarchus has not said that he removed to Elea (Velia) in Italy, yet this must be assumed to be so, as he is always considered the father of the Eleatic school. Elea was founded by the Phocæans of Ionia, after they had left their country, which was invaded by the Persians under Cyrus (540 B.C.) The date of the foundation of Elea is fixed about 536 B.C.; but there is no direct evidence to the fact that Xenophanes was one of the colonists of Elea. The statement of Diogenes Laertius is, that, being driven from his country, he lived at Zancle and Catana in Sicily, which is rather vague. According to Timæus, Xenophanes was still living in the time of the first Hiero and Epicharmus, or about 477 B.C., which is entirely inconsistent with the statement of Apollodorus. His verses quoted by Diogenes Laertius make him ninety-two years of age at the time when they were written, and, according to the chronology of Apollodorus, this would be his age in the year 527 B.C. But according to Apollodorus he lived even till the time of Darius and Cyrus; and the first year of the first Darius is 521 B.C. In all this uncertainty perhaps it is safest to adopt the opinion that he lived between the time of Pythagoras and Heraclitus, for he mentions Pythagoras and is mentioned by Heraclitus.

Xenophanes was a poet and a philosopher. He was one of the elegiac poets of Greece, and his elegies are of the symposiac character. A pleasing fragment of one of his symposiac poems is preserved in Athenæus (xi., p. 462, ed. Casaub.), who has also preserved some of his elegiac verses (x. p. 413), in which Xenophanes exalts wisdom above strength, and six verses on the luxury of the Lydians (xii. 527). He also wrote an epic of two thousand verses on the foundation of Elea; and a poem on the foundation of his native city, Colophon. The philosophical doctrines of Xenophanes were expressed in a poetic form, and from the few fragments of his poetry which remain, and the brief notices of him by other writers, we collect what we know of his doctrines. He attacked Hesiod and Homer, both in hexameter verses, elegiacs, and iambic verses (as Diogenes states), for their representations of the deities, to whom they ascribe to attribute all the weakness and vices of mortals. He taught that God was One, unlike man in either in form or mind. He said that men thought that the gods were produced, and had bodies and feelings like their own; and to show the absurdity of likening the divine to the human, he added, that if animals could make representations of the deities, they would make the representations like themselves. Assuming that the deity is the most powerful of beings, he proves that he must of necessity be One, all alike, all endued with equal powers of seeing, comprehending, and hearing; he is the comprehensive unity in which all things are, or, as Cicero expresses it, "all things are One, and this One is unchangeable, and it is God, unproduced and eternal." He is eternal, because he could not proceed from anything else; pure intellect and reason. His notions of the deity were obscurely expressed and not very logically maintained in his assertion that the deity is of a spherical form, neither limited nor unlimited, neither moving nor at rest. God rules and directs all, and things as they appear to us are the imperfect manifestations of the One eternal. We cannot through them attain to a perfect knowledge of what he is, and all our inquiries into the true nature of things are vain.

> "No man has seen the truth, and man shall never
> Know what is truth of God and of the Universe.
> For should one chance to say what's near to truth,
> Still he knows naught, and doubt is over all."

Thus God's true nature cannot be known. Man must contemplate individual things as they appear, which have no real existence of themselves, and while he strives to reach the knowledge of God, he is distracted between this vain effort and the appearances to which he cannot assign truth. Something like this seems to be the meaning of his doctrines, the striking feature of which is the recognition of the opposition between the pure truth and the sensuous appearances. His physical doctrines are hardly known, except by a few vague statements, and it is difficult to reconstruct this part of his system. It is not easy to see from the extant fragments what is the connection between his physical and theological system, but the right conception of his physical system is connected with the right understanding of his theology. It is worth mentioning, as an isolated fact, that, according to Cicero, he said that the moon is inhabited, and that it contained many cities and mountains. Cicero remarks that his verses were not so good as those of Empedocles.

It has been a matter of dispute whether the system of Xenophanes was Pantheistic. A modern writer (Cousin) has taken some pains to clear him from what he calls this accusation of Pantheism, or the conception of everything as the one God. The notion of an absolute

Digitized by Google

unity is the necessary result of all reflection upon the nature of things; the mind can conceive only one first cause, one power which pervades and sustains all things. When men first began to attempt to express their conceptions of the Deity and of the universe, the language of philosophy was unformed, and hence it is possible that their words may to us sometimes express what was not intended. Now some later writers certainly attribute expressions to Xenophanes from which we might infer that his doctrine was Pantheistic; but the passages of the earlier writers, such as Aristotle, distinctly show that, in such passages at least, he speaks of God as a Being eternal and distinct from the visible universe. In order to bring him under the imputation of Pantheism, we ought, as Cousin remarks, to be able to show that he applied those terms to the visible universe which, according to Aristotle and other good authorities, he applied to God. Xenophanes did form, it appears, a distinct conception of the unity of the Deity, but he did not reduce to any systematic form the mode in which the Deity must be viewed in relation to the visible phenomena. He speaks of the Deity as a self-existing all-powerful Being; and he also speaks of all things as being God. Thus his system, so far as we can ascertain it, left room either for the Pantheistic interpretation or for the doctrine of pure Deism. Aristotle says ('Metaph.,' i. 5) that Xenophanes introduced the doctrine of the unity of the one according to reason and the one according to matter; but he said nothing clear on this subject, nor did he ascertain the nature of each, but looking at the whole heavens he said, the One is God. The system of Xenophanes is discussed at great length by Cousin ('Biog. Univ.,' art. 'Xenophanes'), and with considerable ingenuity. This article and the sources at the end of the present article will indicate all the sources which the reader may wish to consult on this obscure subject.

The work attributed to Aristotle, entitled 'On Xenophanes, Zeno, and Gorgias,' should be entitled 'On Melissus, Xenophanes, and Gorgias,' it contains a condensed view and a criticism of the Eleatic philosophy. ('Biographical Dictionary' of the Society for the Diffusion of Useful Knowledge, art. 'Aristotle.')

The chief fragments of Xenophanes are collected in Ritter and Preller, 'Historia Philosophiæ Græco-Romanæ ex fontium locis contexta,' Hamburg. 1838; and they were edited by Simon Karsten, 8vo, Brussels, 1830.

(Diogenes Laertius, *Xenophanes*; Ritter, *Geschichte der Philosophie*, vol. i.)

XENOPHON (*Ξενοφῶν*), the son of Gryllus, an Athenian citizen, was a native of the Attic demus Erchesia. The only extant biography of Xenophon is by Diogenes Laertius, which, as usual, is carelessly written; but this biography and the scattered notices of ancient writers, combined with what may be collected from Xenophon's own works, are the only materials for his life.

There is no direct authority either for the time of Xenophon's birth or death, but these dates may be approximated to with reasonable probability. Laertius and Strabo state that Socrates saved Xenophon's life at the battle of Delium, B.C. 424, a fact which there seems no reason for rejecting, and from which it may be inferred that Xenophon was born about B.C. 444. In his 'Hellenica' (vi. 4, ·) he mentions the assassination of Alexander of Pheræ, which took place B.C. 357, and Xenophon was of course alive in that year. This agrees well enough with Lucian's statement that Xenophon attained the age of above ninety. ('Macrob.' 21.) Much has been said as to Xenophon's age at the time of his joining the expedition of the younger Cyrus, B.C. 401; and the dispute turns on the point whether he was then a young man between twenty and thirty, or a man of forty and upwards. Those who make him a young man rely on the expression in the 'Anabasis' (ii. 1, 12), where he is called *meanieus* (*νεανίσκος*), but in this passage, in place of 'Xenophon,' the best manuscripts read 'Theopompus:' it is also observed that the term *meanieus* was not confined to young men, but was sometimes applied to men of forty at least. Besides this, those who contend that he was forty or upwards in the year B.C. 401, rely on another passage in the 'Anabasis' (vii. 2, 8), where he is spoken of as a man who seemed old enough to have a marriageable daughter. On the whole there is nothing in the 'Anabasis' inconsistent with a date about the year B.C. 444, which may be assigned as that of his birth. This subject and other points in the chronology of Xenophon have been discussed by C. W. Krüger ('De Xenophontis Vitâ Quæstiones Criticæ,' Halle, 1822).

According to Laertius, Xenophon became the pupil of Socrates at an early age. There is also a notice in Philostratus of his receiving lessons from Prodicus of Ceos while he was a prisoner in Bœotia, but there is no other evidence as to the fact of his having fallen into the hands of the Bœotians. In the fable of the Choice of Hercules ('Memorab.,' ii. 1), Xenophon does not give any indication of his personal acquaintance with Prodicus; but nothing can be concluded from such an omission. Photius states that he was also a pupil of Isocrates, who was however younger than Xenophon. If this is true it is probable that he was a pupil of Isocrates before the year B.C. 401. Athenæus (x. 427, ed. Casaub.) also quotes a saying of Xenophon at the table of Dionysius the Tyrant, but he does not say whether the older or younger tyrant is meant. The older tyrant reigned till B.C. 367, and it is more likely, if Xenophon ever went to Syracuse, that he went before B.C. 367 than after. It is not known if Xenophon wrote anything before the year B.C. 401, though Letronne with considerable plausibility would assign the composition of the 'Banquet,' or 'Symposium,' and of the 'Hiero,' to a period before B.C. 401.

There is another question in the life of Xenophon that remains to be discussed, which is somewhat connected with the chronology of his own life and with that of Thucydides. Laertius states, "it is said that Xenophon made known the books of Thucydides, which were then unknown, though it was in his power to appropriate them to himself." There has been a difference of opinion as to the time of the death of Thucydides, and Dodwell, by misunderstanding a passage in the history of Thucydides (iii. 116) as to the third eruption of Ætna, which is there mentioned, has concluded that he was alive in the year B.C. 395. But this is a mistake: the third eruption there spoken of is that of the year B.C. 425, the sixth year of the Peloponnesian war. The history of Thucydides closes with the eighth book, and the year B.C. 411, the twenty-first year of the Peloponnesian war; and there is no evidence to render it in the slightest degree probable that he ever finished it. That he intended to finish it is clear enough from the first chapter of the first book. The 'Hellenics' of Xenophon commence where the history of Thucydides breaks off, and are a continuation of the work of Thucydides. Thucydides was recalled from exile B.C. 403, but it is not known how long he survived his recall. The fact of his not having finished his history leads to a probable conclusion that he did not survive the termination of the war many years, but such conclusion is only a moderate probability, for there are many reasons besides want of time why a man does not finish a large undertaking.

Letronne assumes that Thucydides did not survive the year B.C. 402, but there is no evidence for fixing on this year, and Letronne has been induced to do it simply in order to give to Xenophon the honour of making known the books of Thucydides before the year B.C. 401; for we are certain, he says, that Xenophon was at Athens in the year B.C. 402. But though we may admit the truth of the story, that Xenophon was the first editor of Thucydides, and may even have added the eighth book from the materials collected by the historian, there is no reason for fixing the date of this publication before the year B.C. 401 rather than after.

In B.C. 401 Xenophon went to Sardes to Cyrus, the Persian, the brother of Artaxerxes Mnemon, king of Persia. He tells us himself ('Anab.,' i. 1) the circumstances of this journey. Proxenus, Xenophon's friend, was then with Cyrus, and he invited Xenophon to come, and promised to introduce him to Cyrus. Xenophon took the advice of Socrates, who, fearing that Xenophon might incur the displeasure of the Athenians if he attached himself to Cyrus, inasmuch as Cyrus was supposed to have given the Lacedæmonians aid in their recent wars against Athens, advised Xenophon to consult the oracle of Delphi. Xenophon went to Delphi and asked of Apollo not what he should do should sacrifice and make his vows in order to secure success in the enterprise which he meditated. The god gave him his answer, but Socrates blamed him for not asking whether he should undertake the voyage or not. However, as he had obtained an answer from the god, Socrates advised him to follow the god's directions; and accordingly Xenophon set out for Sardes, where he found Cyrus and Proxenus just ready to leave the city on an expedition. This story is characteristic both of Socrates and Xenophon.

It was given out by Cyrus that his expedition was against the Pisidians, and all the Greeks in the army were deceived, except Clearchus, who was in the secret. The object of Cyrus was to dethrone his brother, and after advancing a short distance it became apparent to all the Greeks, who however, with the exception of a few, continued their march for a long month through Asia Minor, Syria, and the sandy tract east of the Euphrates, the two brothers met at Cunaxa, not far from Babylon. Cyrus fell in the almost bloodless battle that ensued, his barbarian troops were discouraged and dispersed, and the Greeks were left alone in the centre of the Persian empire. Clearchus was by common consent invited to take the command, but he and many of the Greek commanders were shortly after massacred by the treachery of Tissaphernes, the Persian satrap, who was acting for the king. It was now that Xenophon came forward. He had hitherto merely followed the army of Cyrus, and had neither held a command nor even been considered as a soldier. He introduces himself to our notice at the beginning of the third book of the 'Anabasis' in that simple manner which characterises the best writers of antiquity. From this time Xenophon became one of the most active leaders, and under his guidance the Greeks effected their retreat northwards across the high lands of Armenia and arrived at Trapezus (Trebisond), a Greek colony on the south-east coast of the Black Sea. From Trapezus Xenophon conducted the Greeks to Chrysopolis, opposite to Byzantium. Both he and the army were in great distress, for they had lost everything in the retreat, and they were therefore ready enough to accept the proposals of Seuthes, king of Thrace, who wished to have their aid in recovering the kingly power. The Greeks performed the stipulated services, but the Thracian would not pay the amount agreed on, and it was not till after some negotiations that Xenophon obtained a part of what was due to the army. At this time the Lacedæmonian general Thimbron was carrying on a war against Tissaphernes and Pharnabazus, and he invited the Greeks under Xenophon to join him. At the request of his soldiers Xenophon conducted the troops back into Asia, and they joined the army of

Digitized by Google

Thimbron (B.C. 399). Immediately before giving up the troops, Xenophon with a part of them made an expedition into the plain of the Caicus, for the purpose of plundering a wealthy Persian named Asidates. The Persian was taken, with his women, children, horses, and all that he had. Xenophon received a good share of the plunder. ('Anab.,' vii. 8, 23.)

It is uncertain what Xenophon did after giving up the troops to Thimbron. He remarks ('Anab.,' vii. 7, 57), just before he speaks of leading the troops back into Asia, that he had not yet been banished; but as it is stated by various authorities that he was banished by the Athenians because he joined the expedition of Cyrus against the Persian king, who was then on friendly terms with the Athenians, it is most probable that the sentence of banishment was passed against him in the year B.C. 399, in which Socrates was executed. It seems reasonable enough that the execution of Socrates should be followed or accompanied by the banishment of his pupil, who was adding to his former offence that of putting troops in the hands of the Lacedæmonians to act against the Persian king. Letronne assumes, in the absence of evidence, that he returned to Athens in B.C. 399. But it is much more likely that he stayed with Thimbron, and with Dercyllidas, the successor of Thimbron; and there are various passages in the 'Hellenica' which favour the conjecture.

Agesilaus, king of Sparta, was sent with an army into Asia, B.C. 396, and Xenophon was with him during the whole, or part at least, of this Asiatic expedition. Agesilaus was recalled to Greece B.C. 394, and Xenophon accompanied him on his return ('Anab.,' v. 3, 6), and he was with Agesilaus in the battle against his own countrymen at Coroneia, B.C. 394. According to Plutarch, he accompanied Agesilaus to Sparta after the battle of Coroneia, and shortly after settled himself at Scillus and Elcia, near Olympia, on a spot which the Lacedæmonians gave him, and here, it is said, he was joined by his wife Philesia and her children. Philesia was apparently the second wife of Xenophon, and he had probably married her in Asia. On the advice of Agesilaus he sent his sons to Sparta to be educated. Thus Xenophon had become an exile from his country for an act of treason, or what was equivalent to treason; he had received a present of land from the Lacedæmonians, the enemies of the Athenians, and he was educating his children in Spartan usages.

From this time Xenophon took no part in public affairs. He resided at Scillus, where he spent his time in hunting, entertaining his friends, and in writing some of his later works. Diogenes Laertius states that he wrote here his histories, by which he must mean the 'Anabasis' and the 'Hellenica,' and probably the 'Cyropædia.' During his residence here also he probably wrote the treatise on 'Hunting,' and that on 'Riding.' The history of the remainder of his life is somewhat doubtful. Diogenes says that the Eleians sent a force against Scillus, and as the Lacedæmonians did not come to the aid of Xenophon, they seized the place. Xenophon's son, with some slaves, made their escape to Lepreum; Xenophon himself first went to Elis, for what purpose it is not said, and then to Lepreum to meet his children. At last he withdrew to Corinth, and he probably died there. The time of his expulsion from Scillus is uncertain; but it is a probable conjecture of Krüger, that the Eleians took Scillus not earlier than B.C. 371, in which year the Lacedæmonians were defeated in the battle of Leuctra. Letronne fixes the date at the year B.C. 368, though there is absolutely for this present year; but he considers it most probable that the Eleians invaded Scillus at the time when the Lacedæmonians were most engaged with the Theban war, which would be during the invasion of Laconia by Epaminondas. Xenophon must have lived above twenty years at Scillus, if the date of his expulsion from that place is not before the year B.C. 371. The sentence of banishment against Xenophon was revoked by a decree proposed by Eubulus; but the date of this decree is uncertain. Before the battle of Mantineia, B.C. 362, the Athenians had joined the Spartans against the Thebans. Upon this Xenophon sent his two sons Gryllus and Diodorus to Athens, to fight on the Spartan side against the Thebans. Gryllus fell in the battle of Mantineia, in which the Theban general Epaminondas also lost his life. Letronne assumes that the decree for repealing the sentence of banishment against Xenophon must have passed before B.C. 362, because his two sons served in his Athenian army at the battle of Mantineia. But this is not conclusive. Krüger, for other reasons, thinks that the sentence was repealed not later than Ol. 103, which would be before the battle of Mantineia. No reason is assigned by any ancient writer for Xenophon not returning to Athens: for in the absence of direct evidence as to his return, we must conclude that he did not.

Several of his works were written or completed after the revocation of his sentence: the 'Hipparchicus;' the Epilogus to the 'Cyropædia,' if we assume that his sentence was revoked before B.C. 362; and the treatise on the 'Revenues of Athens.' Steinhelbers, quoted by Diogenes, places the death of Xenophon in B.C. 359; but there is much uncertainty on this matter. (Clinton, 'Fast. Hellen.,' B.C. 359, and his remarks on the death of Alexander of Pheræ.) Probably he died a few years after B.C. 359.

The extant works of Xenophon may be distributed into four classes: Historical—the 'Anabasis,' the 'Hellenica,' and the 'Cyropædia,' which however is not strictly historical, and the 'Life of Agesilaus;' Didactic—the 'Hipparchicus,' 'On Horsemanship,' and 'On Hunting;' Political—the 'Republics of Sparta and Athens,' and the 'Revenues of Attica;' Philosophical—the 'Memorabilia of Socrates,' the 'Œconomic,' the 'Symposium, or Banquet,' the 'Hiero,' and the 'Apology of Socrates.' There are also extant certain letters attributed to Xenophon, but, like many other ancient productions of the same class, they are not genuine. The works of Xenophon as enumerated by Diogenes agree exactly with those which are extant, and we may therefore conclude that we have at least as many works as Xenophon published, though all of them may not be genuine. It is true that Diogenes says that Xenophon wrote about forty books (*βιβλία*), but he says that they were variously divided, from which expression, and the list that he gives, it is certain that by the word *βιβλία*, he intends to reckon the several divisions or books, as we call them, of the 'Anabasis,' 'Hellenica,' 'Cyropædia,' and 'Memorabilia,' as distinct biblia, and thus we have in the whole the number of thirty-eight, which is near enough to forty.

The editions of the collected works of Xenophon and of the separate works are very numerous. The 'Hellenica' was the first work that appeared. It was printed at Venice, folio, 1503, by the editor Aldus, under the title of 'Paralipomena,' and as a supplement to his edition of Thucydides, which was printed in 1502. The first edition of the works of Xenophon was printed by P. Giunta, folio, Florence, 1516; but the Agesilaus, the Apology, the treatise on the Revenues of Athens, and a part of the treatise on the constitution of Athens are wanting. The edition of Andreas of Asola, folio, 1525, contains everything except the 'Apology.' The first complete edition of the works of Xenophon was the Giunta edition of Hall, 3 vols. 8vo, 1540, with a preface by Melanchthon, who also added the 'Apology,' which had been published by John Kenchlin (Capnio), 4to, at Hagenau, 1520. The Basel edition of 1545, folio, printed by Nic. Brylinger, is the first which contains the Greek text with the Latin version. The editions of Henry Stephens, 1561, 1581, contain an amended text: the edition of 1561 has no Latin version, but that of 1581 has. The editions of Leunclavius were the foundation of the edition of Johann Looewenklau, 1572, commonly called Leunclavius, Basel, 1569, Frankfort, 1594, accompanied with the Latin version. The edition of B. Weiske, 6 vols. 8vo, Leipzig, 1798–1804, did nothing towards a new recension of the text, though it is corrected in many places. The most pretending edition of all the works of Xenophon is that of Gail, on which it is fair to take the opinion of his own countryman Letronne. This edition is entitled "'Œuvres complètes de Xénophon traduites en Français, accompagnées du texte, de la version Latine, et de notes critiques,' 4 vols. 8vo, 1797–1804. There is a seventh volume, in three parts, one of which (1809) contains the variations of three manuscripts; a second (1814) contains the notices of the manuscripts, and observations, literary and critical; and the third an Atlas of maps and plans. Gail has kept to the old text, and has made no use of his various manuscripts in improving it. His many and critical observations, in which he discusses certain difficult passages, are more useful for the understanding of Xenophon than for the correction of the text. The convenient division into paragraphs has unfortunately been only adopted in the last volume, which contains the 'Memorabilia,' the 'Œconomic,' 'Hunting,' and the 'Hipparchicus.' The Latin version is that of Leunclavius, which is corrected in some passages. The French version is only new in parts. The author acknowledges that he has taken those of the 'Cyropædia,' the 'Memorabilia,' and the 'Anabasis,' by Talbot, Levêque, and Larcher, with some few alterations, made, as he says, for the following reason:—'I was induced to copy these three versions; but the publisher of one of these three versions having given me notice of certain claims of his own (des prétentions), to avoid all discussion, I made some alterations.' There are indexes of the contents of each volume, except the first, which has only a title of the chapters, and that very insufficient," &c. This is very moderate praise, but it is quite as much as Gail's pompous edition deserves. Zeune published an edition of the various works of Xenophon, except the 'Hellenica,' between 1778 and 1785, in 5 vols. 8vo. Schneider revised this edition: he published the 'Hellenica' in 1794; the 'Memorabilia' in 1790 and 1801; the 'Cyropædia' in 1800; the 'Œconomic' and the 'Agesilaus' in 1805; the 'Anabasis' in 1806; and the Political minor works in 1815.

The 'Anabasis' (*Ἀνάβασις*), in seven books, is the work by which Xenophon is best known. It contains the history of the expedition of the younger Cyrus against his brother Artaxerxes Mnemon, and the retreat of the Greeks who accompanied him. The first book contains the march of Cyrus to the neighbourhood of Babylon, and ends with the death of the traitor Clearchus. The remaining six books contain the account of the retreat of the Ten Thousand, as the Greek army is often called. The work is written in an easy agreeable style, and is full of interest as being a minute detail by an eye-witness of the hazards and adventures of the army in their difficult march through an unknown and hostile country. The impression which it makes is favourable to the writer's veracity and his practical good sense; but as a history of military operations, it is as much inferior to the only work of antiquity with which it can be compared, the 'Commentaries' of Cæsar, as the writer himself falls short of the lofty genius of the great Roman commander. There are numerous editions of the 'Anabasis,' which have merit enough so far as concerns the critical handling of the text, but not one of them contains a sufficient commentary. The work of Major Rennell is still the best commentary, 'Illustrations

Digitized by Google

chiefly geographical, of the History of the Expedition of Cyrus,' &c., 4to, London, 1607. There are several English translations, of which that of Spelman is the best known.

The authorship of the 'Anabasis' is not quite free from doubt, owing to a passage in the third book of the 'Hellenics' (iii. 1, 1), where the author refers to a work of Themistogenes of Syracuse for the history of the expedition of Cyrus and the retreat of the Greek army to the Euxine. This however is not a complete description of the contents of the 'Anabasis' of Xenophon, whose narrative also conducts the army from Trapezus on the Euxine to Byzantium. Still the retreat may fairly be considered as having terminated when the army reached a Greek colony on the Euxine, and so indeed it is viewed in the 'Anabasis' (v. 1, 1). There is then perhaps no doubt that Xenophon does refer to the 'Anabasis' which we have, and if this be admitted, the difficulty is not easy of solution. Plutarch ('De Glor. Athen.') supposes that Xenophon attributed the work to Themistogenes, in order that people might have more confidence in what was said of himself. But this is not satisfactory. Others suppose that there was a work by Themistogenes which gave the history of the retreat as far as Trapezus, and that Xenophon published his 'Hellenica' in two parts, and that he first continued the history of the Peloponnesian war to the capture of Athens, which would complete the history of Thucydides, and also carried it to the year B.C. 399. This is the conjecture of Letronne, who connects it with the assumption of Xenophon returning to Athens in B.C. 399, as to which there is no evidence. This history up to the year B.C. 399 comprehends the first two books of the 'Hellenics,' and the first paragraph of the third book, in which Themistogenes is mentioned. Letronne assumes that this first part was begun before Xenophon joined the expedition of Cyrus, and was finished either in the interval of his assumed return from Asia and his departure to join the army of Agesilaus, or in the early part of his retreat at Scillus, at which time it is further assumed that he had not yet written the 'Anabasis,' and was employed on that. To the 'Anabasis' of Themistogenes, which, it is still further assumed, was already published and known. The rest of the 'Hellenics,' it is assumed, was written later, and perhaps not published till after the death of Xenophon, by his son Diodorus or his grandson Gryllus. If all this assumption is necessary to explain the fact of Xenophon referring to the work of Themistogenes on the 'Anabasis,' we may as well assume that there was no such work of Themistogenes, for we know nothing of it from any other quarter, and that Xenophon for some unknown reason spoke of his own work as if it were written by another person. In reading the 'Anabasis,' it is difficult to resist the conviction that it is by Xenophon, especially when we turn to such passages as that in the fifth book where he speaks of his residence at Scillus, and other passages in which he speaks of his dreams, his thoughts, and other matters which could only be known to himself.

The 'Hellenica' (Ἑλληνικά), in seven books, comprehend a period of forty-eight years, from the time when the history of Thucydides ends, B.C. 411, to the battle of Mantineia, B.C. 362. They record however, as already observed, the assassination of Alexander of Pherae, which took place in B.C. 357. The hypothesis that this history is considered properly of two works or parts has been mentioned. This is Niebuhr's opinion. [THUCYDIDES.] The 'Hellenica' have little merit as a history. The author was altogether deficient in that power of reflection and of penetrating to the motives of action which characterise the great work of Thucydides. It is generally a dry narrative of events, and contains little to move or affect, with the exception of a few incidents which are given with more than the usual detail. The parts also are not treated in their due proportions, and many important events are passed over briefly. This, the only proper historical work of Xenophon, does not entitle him to the praise of being a good historical writer. It may be urged that the work was only a kind of 'Mémoires pour servir,' as some have supposed; but if it is to be taken as a continuation of Thucydides, it is a history, and as such it has been considered both in ancient and modern times. There is an English translation of the 'Hellenica' by W. Smith, the translator of Thucydides.

The 'Cyropaedia' (Κύρου παιδεία) is not an historical but a political work, in which the ethical element prevails. Its object is to show how citizens can be formed to be virtuous and brave, and to exhibit also a model of a wise and good governor. Xenophon chooses for his exemplar Cyrus, the founder of the Persian empire, and the Persians are his models of men who are brought up in a true discipline. The work has no authority whatever as a history, nor is it even authority for the usages of the Persians, some of which we know from other writers to be different from what they are represented to be by Xenophon. Xenophon borrowed his materials from the Grecian states, and especially from Lacedaemon; and the 'Cyropaedia' is one of the many proofs of his aversion to the usages and the political constitution of his native city. The genuineness of the epilogus, or conclusion of the work, has been doubted by some critics. Its object is to show that the Persians had greatly degenerated since the time of Cyrus. The 'Cyropaedia' is one of the most laboured of Xenophon's works, and contains his views on the training of youth, and of the character of a perfect prince. It is an agreeable exposition of principles under the form of a history, and, like Xenophon's other treatises, it contains more of plain practical precepts, founded on observation and supported by good sense, than any profound views. The dying speech of Cyrus is worthy of a pupil of Socrates. There is an English translation of the 'Cyropaedia' by Maurice Ashley Cowper.

The 'Agesilaus' (Ἀγησίλαος) is a panegyric on Xenophon's friend, the Lacedaemonian king, another evidence of his Laconian or Spartan predilections. Cicero ('Ad Fam.,' v. 12) says that he has in this panegyric surpassed all the statues that have been raised in honour of kings. Many modern critics have passed an unfavourable judgment on this work, and some maintain that it is the work of a sophist or orator of a later age. It has been described as a kind of cento made up of passages copied literally from the 'Hellenica' and other works of Xenophon.

The 'Hipparchicus' (Ἱππαρχικός) is a treatise on the command of the cavalry, in which Xenophon gives instructions for the choice of cavalry men, and remarks on the duty of a commander of cavalry. There is internal evidence that this treatise was written at Athens, but there are different opinions as to the time when it was composed.

The treatise on 'Horsemanship' (Ἱππική) was written after the 'Hipparchicus,' to which reference is made at the end of this treatise. The author says that he has had much experience as a horseman, and is therefore qualified to give instruction to others. He speaks at the beginning of a work on the subject by Simon, in whose opinions he coincides, and he professes to supply some of his omissions. This work is translated into English, and was printed by Henry Denham, 4to, London, 1584.

The 'Cynegeticus' (Κυνηγετικός) is a treatise on Hunting, a sport of which the author was very fond. It contains many excellent remarks on dogs, on the various kinds of game, and the mode of taking it. [ARRIANUS.]

The treatises on the Republics of Sparta and Athens were not always recognised as genuine works of Xenophon, even by the ancients; and some modern writers have adopted this opinion. But there is nothing in them, as Boeckh observes, that can be urged against Xenophon. They show his attachment to Spartan institutions, and his dislike of democracy. There is an English translation of the 'Republic of Athens,' by James Morris, 8vo, London, 1794.

The treatise on the 'Revenues of Athens' (πόροι ἢ περὶ προσόδων) has for its object to show how the revenues of Athens, and especially those derived from the mines, may be improved by better management, and be made sufficient for the maintenance of the poor citizens and all other purposes, without requiring contributions from the allies and subject states. The matter of this treatise is discussed by Boeckh, in his work on the 'Public Economy of Athens.' This treatise was translated into English by Walter Moyle, 8vo, 1697, and reprinted in Moyle's whole works.

The 'Memorabilia of Socrates,' in four books (Ἀπομνημονεύματα Σωκράτους), is the chief philosophical work of Xenophon. To defend his master against the charges of irreligion and corrupting the youth of Athens, and in a series of conversations he introduces Socrates after his fashion as developing and inculcating various moral truths. The tendency of the work is entirely practical, and it may be true, as some critics maintain, that Xenophon has exhibited the teaching of Socrates in a manner more conformable to his own notions than in the full sense and spirit of the Socratic method. But Xenophon was a hearer of Socrates, lived for a long time on terms of intimacy with him, and as he was anxious to defend the memory of his master, and certainly had no pretensions to originality himself as a thinker, we may assume that the matter of the 'Memorabilia' is genuine, that the author has exhibited a portion of the moral and intellectual character of Socrates, such part as he was able to appreciate, or such as suited his purpose; and that we have in this work as genuine a picture of Socrates as his pupil Xenophon could make. There is an English translation of the 'Memorabilia' and the 'Apology for Socrates,' by Sarah Fielding. The 'Apology' (Ἀπολογία Σωκράτους πρὸς τοὺς Δικαστάς) is not, as the title imports, the defence which Socrates made on his trial, but it contains the reasons which determined him to prefer death rather than to humble himself to ask for his life from his prejudiced judges. Valckner and others do not allow this to be Xenophon's work, because they consider it to be unworthy of him: but if a man is to lose the discredit of a bad work simply because he has written a better, many persons may disown their authorship. The 'Apology' is indeed a trivial performance, but Xenophon did write an 'Apology,' according to Laertius, and this may be it.

The 'Symposium,' or 'Banquet of the Philosophers' (Συμπόσιον), has for its object the delineation of the character of Socrates. It is in the form of a dialogue between Socrates, Antisthenes, Critobulus, and others, at the house of Callias. It contains the opinions of Socrates on the subject of love and friendship. It is an ancient tradition that Xenophon wrote this work after the 'Symposium' of Plato, and that he designed to correct the view of Socrates which is there given by Plato. Boeckh thinks that Plato wrote his 'Symposium' after reading that of Xenophon, and that his purpose was to exhibit the ideal of a wise man in the person of Socrates. As it is of the same opinion, and thinks that the 'Symposium' is a juvenile work. The 'Banquet' was translated by James Wellwood, M.D., 1710, and reprinted in 1750.

The 'Hiero' (Ἱέρων ἢ τυραννικός) is a dialogue between Hiero, tyrant of Syracuse, and the poet Simonides. The tyrant describes the

Digitized by Google

dangers and vexations incident to the possession of power, and contrasts the tyrant's condition with the tranquillity of a private man. The poet shows that the tyrant has it in his power to oblige persons more than private individuals can, and he offers some suggestions as to the best mode of using power and making the people happy. It has been already stated that there is one brief notice of Xenophon making a voyage to Sicily, and Letronne conjectures that the composition of this little treatise may have been suggested by what Xenophon saw of a tyrant's life at the court of Dionysius. This little piece has considerable artistic merit, and it is justly observed that it savours of the school of Isocrates more than any other of Xenophon's works. There is a translation of this work attributed to Queen Elizabeth, but we do not know on what authority. It first appeared in 1713, 8vo, in 'Miscellaneous Correspondence,' No. 11, with the title 'A Translation of a Dialogue out of Xenophon in Greek, betweeo Hiero, a king, yet some tyme a private person, and Simonides, a poet, as touching the life of the prince man.' By Elizabeth, Queen of England.' A translation also appeared in 1793, 8vo, which is attributed to the Rev. R. Graves, who translated Maximus Tyrius.

The 'Œconomio' (Οἰκονομικός) is a discourse on the management of a household and on agriculture, between Socrates and Critobulus. In the fourth chapter Socrates speaks of Cyrus the Younger, and his love of horticulture. This passage was written after the death of Cyrus, and the whole work probably belongs to a late period of Xenophon's life, though Socrates is introduced as pronouncing the panegyric of Cyrus. It is a confirmation of the authorship of the 'Anabasis' being rightly assigned to Xenophon, that he speaks of Cyrus, his character, and death in the same manner, and almost in the same words which are used in the 'Anabasis' ('Oeconom.,' c. 4; 'Anab.,' i. 8, 9). The seventh chapter contains a charming conversation between Ischomachus and his wife, on the duty of a good wife, which consists in the proper management of the interior of the house; it is the husband's business to labour out of doors and to provide what in the house requires; for it is the wife's business to take care of what the husband produces, and to apply it to the uses of the house. The husband's employment, as here represented, is agriculture in a country where slaves are the labourers; but the picture of a married life will suit every condition, and modern wives might learn from this excellent treatise that their employment is at home; that the object of marriage is the happiness of the husband and wife, the procreation of children, and their proper nurture and education. Fidelity to her husband, frugal management of his substance, and the care of his children are the wife's duties, which are incompatible with gadding abroad. This is one of the best treatises of Xenophon. It was translated into Latin by Cicero. There are several English translations. The first is by Gentian Hervet, London, 8vo, 1534, which has been reprinted several times. There is also a translation by Robert Bradford, F.R.S., London, 8vo, 1727.

The general character of Xenophon may be estimated from this brief sketch of his life and writings. Before we heap upon him all the abuse which some modern writers have done, we ought to have the facts of his life with sufficient minuteness to enable us to judge of every part of it. He did not like the democracy of his native city, and he may have been glad of the opportunity of leaving Athens which the invitation of Proxenus offered. If his own statement is true, he was not to blame for joining the expedition of Cyrus, though it is very probable that he was blamed for it at Athens, and supposed to have been well acquainted with the design of Cyrus from the first. The fact of his delivering up the troops to Thimbron, the Lacedæmonian, after the campaign in Thrace, was well calculated to add to the jealousy of the Athenians, and his native city cannot be charged with more than her usual severity in banishing him for his part in the expedition of Cyrus and the subsequent events. So far there is nothing which will justify us in attaching any serious imputation on Xenophon. Though a man is born in a democracy, he may not like it; and nobody would blame him for leaving it for some other country that he liked better. Xenophon's presence at the battle of Coronein cannot be so satisfactorily explained; but it may be that he did not take part in it; and after having joined Agesilaus in Asia, it is very probable that he could not safely avoid accompanying him back to Europe. Being banished from Athens, his only safety was in keeping with his friends the Lacedæmonians. One step in a man's life often decides all the rest, and involves him in a train of circumstances which he could not foresee, and which leave his character not free from imputation. This was, in Xenophon's case, his joining the expedition of Cyrus. There is no proof of his active hostility against Athens after his banishment: there is proof enough that he preferred Sparta and Spartan constitutions; and if that is blame, he deserves enough of it.

Xenophon appears to have been humane and gentle in his character. He evidently liked quiet. He was fond of farming, hunting, and rural occupations generally. His talents would have suited him for administration in a well-ordered community, but he was not fitted for the turbulence of Athenian democracy. He was a religious man, or, as we are now pleased to term it, a superstitious man. He believed in the religion of his country, and was scrupulous in performing and enforcing the observance of the usual ceremonies. He had faith in dreams, and looked upon them as manifestations of the deity. His philosophy was the practical: it had reference to actual life, and in all practical matters and everything that concerns the ordinary conduct of human life he shows good sense and honourable feeling. He was in understanding a plain sensible man, who could express with propriety and in an agreeable manner whatever he had to say. As a writer he deserves the praise of perspicuity and ease, and for these qualities he has in all ages been justly admired. As an historical writer he is infinitely below Thucydides: he had no depth of reflection, no great insight into the fundamental principles of society. His 'Hellenica,' his only historical effort, would not have preserved his name, except for the importance of the facts which this work contains and the deficiency of other historical records. His 'Anabasis' derives its interest from the circumstances of that memorable retreat, and the name of Xenophon is thus connected with an event which exposed to the Greeks the weakness of the Persian empire, and prepared the way for the future campaigns of Agesilaus and the triumphs of Alexander. The narrative of the retreat may be compared with Herodotus for the minute detail of well-selected facts, the simplicity of the narration, and the general clearness of the whole. Some difficulties may be owing to corruption of the text, and in some cases the author's memory or his notes may have deceived him. The 'Anabasis' is a work of the kind which few men have had the opportunity of writing, and there is no work in any language in which personal adventure and the conduct of a great undertaking are more harmoniously and agreeably combined.

The works of Xenophon which are called philosophical should be entitled treatises on practical ethic and œconomic. Philosophy to him never was known as a science: the character of his mind and his writings do not allow him to be compared in any way either with Plato or with Aristotle, the two great exemplars of philosophy among the Greeks. Yet the Memoirs of Socrates and the treatise entitled Œconomic have a great charm, both from the representation which they give of the personal character of Socrates, and the easy agreeable form in which his lessons are inculcated. Those two works and the 'Anabasis' are the best works for giving a young student a knowledge of the Greek language; and if the 'Memorabilia' and 'Œconomic' cannot be considered an introduction to Greek philosophy, they will at least teach nothing erroneous, and they will lead the student to the contemplation of the Greeks in their domestic relations and their moral habitudes.

The following books will enable the reader to find nearly all that has been said of Xenophon and his writings: Fabricius, 'Bibliotheca Græca;' Schoell, 'Geschichte der Griechischen Literatur,' German edition; 'Biog. Univ.,' art. 'Xenophon,' by Letronne; Hoffmann, 'Lexicon Bibliographicum,—Xenophon,' which contains a list of all the editions up to the date of its publication, of the separate works, of the translations into English and other languages not here mentioned, and of the works which have been written in illustration of Xenophon's writings. More recent editions of Xenophon's separate writings in the original are too numerous to mention here. An English version of the whole works of Xenophon (chiefly by the Rev. J. S. Watson) is contained in 3 volumes of Bohn's 'Classical Library.'

XENOPHON OF EPHESUS. There is extant a Greek romance entitled 'Ephesiaca, or a History of Anthia and Abrocomas' (Ἐφεσιακὰ τὰ κατὰ Ἀνθίαν καὶ Ἀβροκόμην). The author calls himself Xenophon of Ephesus. We know nothing of his life, and there is no evidence as to the period when he lived. From indications in the work itself, Locella places him in the age of the Antonines, and others in the 4th or 5th century of our era. Fessrikamp, the last editor, considers him the oldest of all the Greek writers of romances. The style of the work is simple, and the narrative is concise, clear, and free from confusion, though many persons are introduced. The incidents are not multiplied beyond the limits of propriety and probability. Suidas is the only person who mentions the author of the 'Ephesiaca,' and he says that there are ten books; but there are only five now, and apparently the work is complete, or nearly so. Only one manuscript of the work exists. The first edition of this work, accompanied with a Latin translation, was by Ant. Cocchi, London, 8vo and 4to, 1726. This edition is printed from a very incorrect transcript of the original manuscript. The Baron A. E. de Locella brought out at Vienna, 4to, 1796, a good critical edition, founded on a careful examination of the manuscript. This edition contains a new translation and a commentary. The latest edition is by P. Hoffmann Peerlkamp, Haarlem, 4to, 1818. There are German, French, and Italian translations of this romance. An English version, by Rooke, appeared at London, 8vo, 1727.

XERXES I. (Ξέρξης), king of Persia, succeeded his father Darius, the son of Hystaspes, B.C. 485. Before he was raised to the throne, Darius had three sons by his wife, a daughter of Gobryas, of whom the eldest was Ariabanes. After he became king, he had four sons by Atossa, the daughter of Cyrus, of whom Xerxes was the eldest. Darius appointed Xerxes his successor.

Darius died during his preparations for war against the Egyptians and the Athenians. In the second year after his father's death, Xerxes marched against Egypt, which had revolted in the time of Darius. He reduced the country to obedience, and gave the administration to his brother Achæmenes. He next employed himself for four full years in making preparations for his Greek expedition. The immense force which was assembled for this purpose was collected from every part of the Persian dominions. The fleet was supplied from Egypt, Phœnicia, Cyprus, Cilicia, and other maritime parts

Digitized by Google

which were within the limits of the Persian government. Xerxes also entered into negociations with the Carthaginians, who engaged to attack the Greek cities of Sicily and Italy, while the Persian king invaded Greece.

In the autumn of B.C. 481 Xerxes arrived at Sardis, the capital of the Persians in the west, and he wintered there. In the spring he advanced to the Hellespont with his forces, and crossed at Abydos by a bridge of boats. The first bridge that was made was destroyed by a storm, on which the king ordered that 300 blows of the lash should be inflicted on the rebellious Hellespont. The superintendents of the work had their heads cut off for their pains. A new bridge was constructed, the form of which is minutely described by Herodotus (vii. 36). The army was seven whole days and nights in crossing the bridge from Abydos on the Asiatic to the European shore. The march was continued from the Hellespont through the Thracian Chersonese. The fleet did not enter the Hellespont, but took a western course along the Thracian coast. On arriving at the plain of Doriscus, which is near the sea, and is traversed by the river Hebrus, Xerxes numbered his force. The ships took their station close by Doriscus. The infantry amounted to 1,700,000 men. The number was ascertained not by tale but by measure: an enclosure was formed large enough to contain 10,000 men, and it was filled and emptied till the whole army was mated. (Herod., vii. 60.) After being measured the forces were arranged according to nations. Herodotus has left one of the most curious historical records that exists in his description of the various nations that composed this mighty force, and of their military equipment (vii. 61, &c.). The cavalry amounted to 80,000, besides camels and chariots. The war-ships (τριήρεις) were 1207. Herodotus has enumerated the several nations which supplied and manned the ships (vii. 89). From Doriscus Xerxes continued his march through Thrace. Herodotus, who had certainly gone over the ground, has described the route of the army with great distinctness. On reaching the isthmus which connects the mountain peninsula of Athos with the main land, the fleet avoided the circumnavigation which had proved so dangerous to Mardonius in B.C. 492, by passing through the canal of Xerxes. This canal had been constructed by order of Xerxes. It is described by Herodotus (vii. 22). From Acanthus, near the isthmus of Athos, the army marched to Therme, afterwards called Thessalonica (now Saloniki), on the Axius. The fleet at last reached Sepias on the coast of Magnesia, in Thessaly, and the army reached the pass of Thermopylæ. So far, says Herodotus, they had sustained no harm, and the numbers of the army and of the navy were then as follow (Herod., vii. 184):—The whole number of men in the 1207 ships was 277,610, reckoning for each ship 200 men of the country to which each ship belonged, and also 20 for Persians, Medes, and Sacæ in each of these ships. The penteconters (πεντηκόντεροι), which Herodotus had not included in his former enumeration, were 3000, and, reckoning 80 to each, there would be 240,000 men in them. Thus the whole naval force would amount to 517,610; and the whole armament, both military and naval, would amount to 2,317,610 men, which includes 20,000 men not before enumerated, camel-drivers, and drivers of Libyan chariots. This is the amount of the force which passed over from Asia, and it does not include the camp-followers, the vessels that carried provisions, and the men on board these vessels. To this must be added the Phœnician vessels, containing 24,000 men, that joined the navy of Xerxes. The forces supplied by the Thracian tribes, the Macedonians, Magnesians, and others, amounted to 300,000 men: thus the whole number of fighting men was 2,641,610. Herodotus considers that all the followers and those in the provision vessels would be more than the fighting men, but we will suppose them to be equal. Thus the sum total is 5,283,220; and Xerxes, says Herodotus, conducted so many as far as Sepias and Thermopylæ. As to the number of women who followed to cook the provisions, and of concubines and eunuchs, no one could tell the amount, nor that of the beasts of burden. The first calamity that befel this mighty host was a storm in the neighbourhood of Sepias, which caused great loss. At Artemisium there was an encounter between some of the Persian ships and those of the Greeks, in which the Greeks were victorious. The army, after passing through Thessaly, found itself stopped at the narrow pass of Thermopylæ by Leonidas and his gallant band. The Persians sustained a heavy loss in endeavouring to force the pass, and they could not effect it till Epialtes, a Melian, showed the Persians a tract over the mountains of Œta, which brought them on the rear of Leonidas (LEONIDAS), who fell with his brave men after an obstinate conflict.

In the sea-fights off Artemisium the Persians again sustained loss (Herod., viii. 11, &c.). The Persian army now advanced through Phocis, burning and devastating all before them. On entering Bœotia they were joined by the Bœotians. A detachment was sent by Xerxes to attack the temple of Delphi, but the invaders sustained a signal defeat, and those who survived escaped into Bœotia. In the mean time the Grecian fleet moved from Artemisium to the island of Salamis, off the coast of Attica. (Herod., viii. 40.) The Athenians sent their females and slaves to Troezen, Ægina, and Salamis, and left their city to the mercy of the Persians, who, after burning Thespia and Platæa, the only towns in Bœotia that did not join them, entered Athens and destroyed it also. The Persians had occupied three months in their progress from the Hellespont to Athens. The fleet of Xerxes sailed from Histiæa in Eubœa through the channel of the Euripus, and in three days reached Phalerum in Attica. Notwithstanding the losses of the Persians, Herodotus considers that the land and sea force which reached Attica was as large as that which had reached Sepias and Thermopylæ. The Grecian fleet was collected about the island of Salamis and in the narrow passage between Salamis and the mainland. Xerxes, having resolved on an engagement, took his station on the shore of the mainland under Mount Ægaleos, opposite to Salamis; and here he had the misfortune to see his mighty armament defeated and dispersed [THEMISTOCLES], B.C. 480. Shortly after the battle he retreated by land to the Hellespont, which he reached in forty-five days, and crossed over into Asia. He was attended as far as the Hellespont by Artabazus with 60,000 men. (Herod., viii. 126.) Mardonius, who was left in Greece with the army, was defeated in the following year, B.C. 479, at Platæa in Bœotia by the combined Greeks, and on the same day the Greeks gained another victory over the Persians at Mycale in Ionia. This was followed by the siege and capture of Sestos on the Hellespont (B.C. 478), an event with which the history of Herodotus ends. It was reported, says Herodotus (viii. 126), that on the very day of the battle of Salamis, Gelon and Theron defeated, in Sicily, Hamilcar and his Carthaginian army. Thus the Greeks were successful both in the east and the west. (GELON.]

The Greeks continued the war against the Persians after the capture of Sestos. Little more is known of the personal history of Xerxes. He was murdered (B.C. 465) by Artabanus, and succeeded by his son Artaxerxes, called by the Greeks the Long-handed. Xerxes, as he is represented by Herodotus, was cruel, vain, cowardly, and of feeble understanding. The great event of his reign is the invasion of Greece with his enormous army and fleet, of which we have in Herodotus (books vii.-ix.) a most minute account. The historian lived soon enough after the event to be able to collect testimony to many of the facts, and that he spared no pains is evident from his work. Much has been said on the large numbers of the army and navy of Xerxes, as stated by Herodotus; but, incredible as they seem at first sight, an attentive consideration of the whole narrative of the expedition will remove much of the doubt; at any rate, if the numbers are exaggerated, it is clear that Herodotus only followed his authorities.

XERXES II., King of Persia, succeeded his father Artaxerxes, the Long-handed, B.C. 425. He was assassinated after a short reign of a year, or, according to some accounts, two months, by Sogdianus, who succeeded him.

XIMENEZ, CARDINAL. [CISNEROS.]

XIPHILINUS, JOANNES (Ξιφιλῖνος), Patriarch of Constantinople, was of a noble family of Trebizond. In 1066 he was made patriarch of Constantinople: he died in 1075. This Xiphilinus has often been confounded with his nephew. He is the author of an 'Oration on the Adoration of the Cross,' which was first published, in Greek and with a Latin version, in Gretser's work on the Cross, fol., Ingolstadt, 1616. Some other works of less importance are attributed to him, among which are three Constitutions on matters of ecclesiastical discipline, two of which refer to betrothment, and are in the 'Jus Græco-Romanum' of Leunclavius.

XIPHILINUS, JOANNES, of Trapezus (Trebizond), was the nephew of Patriarch Xiphilinus. At the command of the Emperor Michael Ducas, whose reign ended A.D. 1070, he made an Epitome of the history of Dion Cassius. The Epitome, as we now have it, commences at the thirty-fifth book, and goes down to the death of Alexander Severus, A.D. 235. His work is not distributed into the original, but is divided into Ἐπιτομαί, each of which comprises the history of an emperor. We can judge of his work by comparing it with those parts of Dion which are extant. He generally keeps to the expression of his author, but he omits what he considers not essential to the narrative. He has also generally omitted to mention the names of consuls, who are recorded in the extant books of Dion, and thus he has done much towards confusing the chronology of the period. Like all other epitomes, it destroys the character of the original work; and it is worthless except as supplying the main historical facts of the large part of Dion which is lost. Xiphilinus was a Christian. The first edition of Xiphilinus was by R. Stephens, 4to, Paris, 1551; and in the same year Stephens printed the Latin version of G. Blanc. The edition of H. Stephens appeared in fol., 1592, with Blanc's translation, revised by Xylander. There is an English translation by Manning, 8vo, London, 1704, of the 'Epitome' of Xiphilinus.

XYLANDER, GULIELMUS. Xylander's real name was Holzmann (Woodman), which, after the fashion of the scholars of the day, he changed into the equivalent Greek form of Xylander. He was born at Augsburg, December 26, 1532, of poor parents. He obtained the patronage of Wolfgang Relinger, a patrician of Augsburg, who procured for him the necessary means for prosecuting his studies till he was received into the College of Augsburg, where he had a certain allowance, which was appropriated to a limited number of pupils. From this we must infer that as a boy he had shown great talent. In 1549 he went to Tübingen, and in 1550 to Basel. His studies were the mathematics and Greek and Latin literature. After the death of J. Micyllus, in 1558, he was made Greek professor at Heidelberg, but he was still very poor, and was obliged to add to his means by his pen. He died in February 1576, having shortened his life by his excessive labour, and, according to some accounts, by drink-

Digitized by Google

ing. It is the statement of Jöcher that his salary as professor was insufficient for his maintenance, and that he was therefore obliged to work for the booksellers; but in the 'Biographie Universelle' (art. 'Xylander,' by Weiss) it is maintained that his salary was sufficient. If he was drunken and extravagant, it may very well have happened that he was always poor and glad to work for money. In the elegiac verses prefixed to his translation of Dion Cassius, and placed at the end of his dedicatory epistle, he complains of his poverty. This dedication is dated November 1, 1557, and in the following year he was appointed professor at Heidelberg. The greater part of his works appeared after his appointment at Heidelberg. Xylander was also named by the elector palatine Frederic, secretary to the convention at Manlbrunn, which was held for the settlement of some differences among the Protestants. He is said to have received money for his services from this prince, and also from the Duke of Würtemberg. It seems probable therefore that, with all these means and what he received for his literary labours, if he was poor after he went to Heidelberg, it must have been through his own improvidence.

Xylander's works are very numerous. A large part of them consists of translations from Greek and Latin authors. His translations into Latin are—1, Plutarch's Works, Basel, 1561–70. 2, Strabo, accompanied with the Greek text, fol., Basel, 1571. 3, 'The Chronicle of Cedrenus,' with the Greek text, fol., Basel, 1565. 4, Tryphiodorus, in Latin verse; he is said to have made this version when he was sixteen years of age. 4, The work of Michael Psellus, 'De Quatuor Disciplinis Mathematicis,' with notes, 8vo, Basel, 1556. 5, 'The History of Dion Cassius,' fol., Basel, 1558, with the Latin translation of Xiphilinus by W. Blanc, which he corrected. [Xiphilinus.] 6, 'The Meditations of the Emperor Marcus Aurelius,' 8vo, Zürich, 1558; 12mo, Lyon, 1559; Greek and Latin, 8vo, Basel, 1568. To this last and corrected edition Xylander added the versions of Antonius Liberalis, the work generally attributed to Apollonius Dyscolus, and which here appears under the Latin title of 'Historiæ Commentitiæ;' Phlegon Trallianus, and Antigonus Carystius 'De Mirabilibus' (*Ἱστορίων Παραδόξων Συναγωγὴ*). 7, Diophantus, with the Greek text, fol., Basel, 1575. This work was dedicated to the Duke of Würtemberg, who made him a present of 500 reichsthaler on the occasion. Though the translation is not free from faults, it is acknowledged to have great merit, considering the difficulty of the subject and the haste with which it was made. 8, Xylander made the first German translation of the first six books of Euclid, Basel, 1562. This is a very rare work: the seventh, eighth, and ninth books had been already translated into German by Johann Scheybel, 4to, Tubingen, 1555. 9, Polybius, into German. 10, The New Testament, into German.

Xylander commenced an edition of Pausanias, which was completed by Sylburg, and published in 1583. The Greek text of the edition of Stephanus Byzantinus, printed by Oporinus, fol., at Basel, 1568, was amended by Xylander, but, as it appears, without the aid of manuscripts. He also superintended the edition of Theocritus, 8vo. Basel, 1558, which contains the Greek scholia not notes by Xylander; and the edition of Horace, 8vo, Heidelberg, 1575.

Among his other labours, he drew up 'Institutiones Aphoristicæ Logicæ Aristotelis, ita scriptæ ut adolescentibus proponi commode, eorumque ad Aristotelem perspicuis aditus ingenium et memoriam juvare possint,' a work intended for the instruction of youth and as an introduction to the study of Aristotle, 4to, Heidelberg, 1577. The writer of this article has never seen the 'Institutiones,' and can only conjecture that it somewhat resembles in plan and design Trendelenburg's 'Elementa Logices Aristotelicæ,' 8nd edit., Berlin, 1842. Trendelenburg however has not mentioned Xylander's work in his preface, from which we conclude that he was either unacquainted with it, or that it is not exactly what we might conjecture it to be.

There are other works of Xylander, but the above are the principal. The Life of this laborious scholar deserves and requires to be written with more care than it has been yet. The ordinary accounts are at variance with one another: some of them attribute to him works that he had either little to do with or perhaps nothing at all; and some omit several works that are undoubtedly his. Xylander was a man of great ability, well versed in Greek and Roman literature, both as to the matter and the language. He wrote Latin with great ease and correctness, and his versions are generally correct.

(Jöcher, *Allgem. Gelehrten Lexicon*, probably not very accurate; Bayle, *Dict.*, art. 'Xylander,' a very insufficient article; *Biog. Univ.*, art. 'Xylander,' by Weiss, is a much better and more complete article, and it contains the references to the original authorities for Xylander's Life and Works.)

Y

YALDEN, THOMAS, was, according to Jacob, in his 'Lives of the Poets,' the 'Biographia Britannica,' and Dr. Johnson, in his 'Lives of the Poets,' the youngest of the six sons of Mr. John Yalden, of Sussex, and was born in the city of Exeter in 1671. Anthony Wood however, who calls him not Yalden, but Youlding, gives a very different account: in his 'Athenæ Oxonienses' (iv. 691), that writer says, "Thomas Youlding, a younger son of John Youlding, sometime a page of the presence and groom of the chamber to Prince Charles, afterwards a sufferer for his cause, and an exciseman in Oxon, after the restoration of King Charles II., was born in the parish of St. John Baptist, in Oxon, on the 2nd day of January 1669 (in which parish I myself also received my first breath)." This account, though it has not been generally adopted, appears to derive some confirmation from the existence in the ante-chapel of Merton College of an epitaph recording the interment there of "John Youlding, gentleman, who was page," &c., as in Wood: he is stated there to have died on the 25th of July 1670, in his fifty-ninth year. Thomas Yalden, or Youlding, was admitted of Magdalen College, Oxford, in 1690; and among his contemporaries there were Sacheverell and Addison, with both of whom he continued to live in friendship ever afterwards. Yalden made his first public appearance as a poet in an 'Ode to St. Cecilia's Day,' which was published, set to music by Purcell, in 1693. This was followed in 1695 by another performance, entitled 'On the Conquest of Namur, a Pindaric Ode inscribed to his most sacred and victorious Majesty.' He had taken his degree of M.A. with great applause in 1691, and having then entered into holy orders, he succeeded Atterbury in 1698, as lecturer at Bridewell Hospital. In 1700 he published a poem entitled 'The Temple of Fame,' on the death of the Duke of Gloucester, and was the same year made Fellow of his college. Soon after this he was prescribed by the college to a living in Warwickshire, which admitted of being held along with his fellowship, and he was also elected moral philosophy reader, "an office," says the 'Biographia Britannica,' "for life, endowed with a handsome stipend and peculiar privileges." On the accession of Queen Anne, he wrote another poem, in celebration of that event; and from this time he is said to have unreservedly sided with the high church party. In 1706 he was taken into the family of the Duke of Beaufort; and the following year he took his degree of D.D. Some time after this he was presented to the adjoining rectories of Chalton and Clanville in Hertfordshire; and he is said to have also enjoyed the sinecure prebends of Deane, Harris, and Pendles, in Devonshire. Upon the discovery of what is called Bishop Atterbury's plot, in 1722, Yalden was taken up, and his papers were seized; but it soon appeared that although he was intimate with Kelly, the bishop's secretary, and in the habit of corresponding with him, the treason, if it existed, was certainly in no part of his concoction or privity. All that is further related of him is, that he died on the 16th of July 1736, having to the end of his life, as Dr. Johnson expresses it, "retained the friendship and frequented the conversation of a very numerous and splendid set of acquaintance." Besides the two early poems that have been mentioned, he published, in 1705, a collection of fables in verse, under the title of 'Æsop at Court,' which is reprinted in the fourth volume of Nichols's Collection, pp. 198-226; 'An Essay on the Character of Sir Willoughby Ashton, a poem,' folio, 1704; 'On the Mines of Carbery Price, a poem;' 'A Hymn to Darkness,' in imitation or translation of Cowley, which Johnson considers to be his best performance, and to be "imagined with great vigour, and expressed with great propriety;" 'A Hymn to Light,' which, in the estimation of the same authority, "is not equal to the other;" a translation of the second book of Ovid's 'Art of Love;' and many other translations and short original pieces. Many of Yalden's productions in verse are printed in the third and fourth volumes of Dryden's (or Tonson's) collection of 'Miscellany Poems;' a number of them are also given in the more recent collections of the 'English Poets,' by Johnson and A. Chalmers; but some appear to be lost, or at least they eluded the research of Mr. Nichols (see his Collection, iii. 167, and iv. 198). Yalden, who had considerable humour, is the author of a paper in prose, entitled 'Squire Bickerstaff detected, or the Astrological Impostor Convicted;' it is a pretended answer to Swift's attacks on Partridge, the astrologer, which he drew up on Partridge's application, and which that person is said to have printed and published without any perception of the joke. It is printed in most of the editions of Swift's works.

YARRELL, WILLIAM, a celebrated British naturalist, was born in Duke-street, St. James's, Westminster, in June 1784. His father was a newspaper agent, and to his business his son succeeded, and continued in it till nearly the close of his life. When young he was fond of field-sports and was not only the first shot, but the first angler of his day. The accurate habit indicated by his superiority in these sports, was the prevailing character of his mind. He was not only the first shot in London but for many years the first sporting authority upon all that had to do with the habits, locality, and appearance of British birds. It was the same with fish. Not satisfied with obtaining his prey, he examined it, preserved it, and described it, and thus became a naturalist. At the age of forty he became a Fellow of the Linnean Society, and from this time he gave up the gun and rod for the pen. From 1825 to the year of his death 1856, he became a constant contributor to the Transactions of the Linnean Society and the various Journals devoted to natural history literature. His earlier papers

Digitized by Google

were devoted to birds, as the following titles of some of his first scientific contributions show:—'On the Change in the Plumage of some Hen-Pheasants' ('Philosophical Transactions,' 117); 'On the Occurrence of some rare British Birds' ('Zool. Journal,' II.); 'On the small horny appendage to the upper mandible in very young chickens' (ibid.); 'On the Anatomy of Birds of Prey' ('Zool. Journal,' III.); 'On the Structure of the Beak and its Muscles in the Crossbill' ('Zool. Journal,' IV.). He was one of the first members of the Zoological Society and contributed many papers to the Proceedings of the Committee of that body. In the first volume of papers published by the Society, Mr. Yarrell contributed no less than seventeen. They exhibit a wide and accurate knowledge of the forms not only of birds but of fishes and mammals. In these papers his dissections are very numerous, and they are very accurate. This is the more remarkable as Mr. Yarrell had not the benefit of a medical education nor any further means of instruction than those supplied by his own industry. It was in these earlier papers that he demonstrated the true nature of White Bait, and showed that this pet morsel of the London epicure is a true species of fish and not the young of the Shad, the Herring, or any other species of fish as had been supposed up to his time. He did not however confine himself to British zoology, many of his papers being devoted to foreign animals, as the following:—'On the Anatomy of the Lesser American Flying Squirrel;' 'On the Woolly and Hairy Penguins of Dr. Latham;' 'On the Arches of the Sternum of the Crane;' the subjects of his research being in this case the animals dying in the menagerie of the Zoological Society in Regent's Park. He was always an active fellow of the Society and one of its vice-presidents at the time of his death. In both as a deep interest in the progress and development of the Gardens, as well as in the diffusion amongst the people of a taste for his favourite science. His various papers amounting to upwards of seventy, the names of which are given in the 'Zoological Bibliography of the Ray Society,' prepared him for the two great works of his life, the histories of British Birds and British Fishes. The 'History of British Fishes' appeared in two vols. 8vo in 1836. It contained original descriptions with an account of the habits and a wood-engraving of every British fish. It was in every way an admirable work, containing accounts of several new fishes, with such descriptions as enabled the naturalist to distinguish them, whilst they were rendered by the agreeable style in which they were written attractive to the dullest of anglers. A second edition of this work appeared in 1851. The 'History of British Birds' appeared in 1843. It was on the same plan as that of the fishes. The illustrations in wood were accurate and beautiful and highly creditable to the enterprise and taste of his publisher Mr. Van Voorst. No work on this subject since the time of Bewick's 'Birds' have been so popular. To many of his details, especially his picturesque tail-pieces, he imitated his great predecessor, but in point of accuracy of description and the homely truthfulness of his account of the habits of birds Mr. Yarrell has had no equal. At the time of his death Mr. Yarrell was treasurer of the Linnæan Society, and had been elected vice-president during the presidency of Robert Brown. Although one of his earliest papers was published in the 'Philosophical Transactions' Mr. Yarrell was never made a Fellow of the Royal Society. He was once proposed, but some unworthy objections having been made to his admission he withdrew his certificate, and although in the latter part of his life, the Royal Society would have gladly admitted him amongst its fellows, and his certificate was signed, it was too late, he positively refused. In August 1856 he was attacked with paralysis, but although he sufficiently recovered to make a voyage to Yarmouth, he was seized with another fit on the evening of his arrival and died on the morning of September 5th, 1856. He was interred at Mayfield in Sussex. [P. H.]

YORCK VON WARTENBURG, HANS DAVID LUDWIG, GRAF, was born on the 26th of September 1759, at Königsberg, in East Prussia, of an old English family which had settled in Pomerania. In 1772 he entered the Prussian military service, and after having suffered imprisonment on account of a duel, he entered that of Holland in 1782. After serving in the Dutch East Indian colonies in 1783–4, and attaining the rank of captain, he re-entered the Prussian service, and in 1806 became captain of a jäger corps. In the campaign of this year he commanded first the advance-guard and then the rear-guard of the army under the Duke of Saxe-Weimar, whose passage of the Elbe, after his defeat on the Saale, he covered with great skill and prudence. At the storming of the little town of Wahren in Mecklenburg he was wounded and taken prisoner, but was soon after liberated on exchange, at the same time with Blücher. In 1807 he was advanced to the rank of major-general. In 1808, on the re-organisation of the Prussian army, he was promoted to the command of the West Prussian division; and in 1810 entrusted with the inspection of the whole of the light troops. In the Russian campaign of 1812 he commanded the Prussian auxiliary corps under General Grawert, on whose sickness he succeeded to the chief command. This corps formed part of the tenth division of the French army under Marshal Macdonald, and his position became a critical one when Bonaparte ordered the tenth division to retreat to Memel. Yorck's corps formed the third column, and brought up the rear. On December 20, 1812, he quitted Mitau, followed by Wittgenstein, whose advanced troops reached Memel on December 27. It was perhaps not so much a sense of his critical situation, as a keen perception of the state of political affairs, that led Yorck, on his own responsibility, to enter into the convention of Tanroggen on December 30, by which he agreed to withdraw his forces from the French army, and as an independent force agreed to remain neuter. The king of Prussia, straitened as he was in his political relations, could not avoid at first publicly avowing his displeasure, but subsequently testified his perfect satisfaction with his conduct. The step certainly displayed his sagacity and strength of character, and was the first bold measure by which the independence of Prussia was asserted. As soon as the Prussian army, which, after the retreat of Napoleon had been rendered insignificant, had been re-organised and armed, he conducted it to the Elbe, where, at Dannekow, he defeated, on April 5, 1813, the French army under Murat, which had been forced to evacuate Magdeburg. On May 19 he fought at Wessig against the greatly superior forces of Napoleon, sustaining his position with skill and firmness, and then took part in the battle of Bautzen. During a truce which followed he strengthened his army considerably, and then joined the Silesian army under Blucher, taking a decided part in the victory on the Katzbach on August 26. On October 3 he gained an important victory with his own corps over Bertrand at Wartenberg, which enabled Blücher to pass to the left bank of the Elbe. At the battle of Leipzig he also played a distinguished part, driving Marmont from an important point after an obstinate conflict on October 16. On the retreat of the French he pressed the flying foe in their passage over the Unstrutt near Freiberg. When the allied army had entered France as victors, Yorck found an opportunity of displaying his military skill. On February 11, 1814, General Sacken had too hastily engaged in battle with Napoleon at Montmirail, and would have been totally defeated had not Yorck come to his assistance, by which he was enabled, though with considerable loss, to effect an orderly retreat. He likewise distinguished himself at the battle of Laon on March 9, where, in conjunction with General Kleist, he conducted the night attack on the right wing of the French army, which led to the dispersion of the corps under Marmont and Arrighi. After the capture of Paris he accompanied his sovereign to London, was created a count with a considerable revenue, and appointed to the command of the army in Silesia and Posen. On the return of Bonaparte from Elba he was nominated to the command of the army assembled on the Elbe and Saale, but as it was not called into action, he did not actually assume it. On July 1, 1815, his only son, an officer in the Brandenberg hussars, was killed in a skirmish at Versailles; the loss greatly affected him, and he applied for and obtained permission to resign his command. He afterwards lived in retirement on his estate at Klein-Öls in Silesia, where he died on October 4, 1830, after having been created a field-marshal in 1821.

YORK, HOUSE OF. Otho, afterwards Otho IV., emperor of Germany, son of Henry V., surnamed the Lion, duke of Bavaria, by Maud, eldest daughter of Henry II. of England, is said to have been created Earl of York by his relation King Richard I. But, with this exception (if it be one), the peerage distinguished by the title of York has always been a dukedom, and has never been conferred except on a son, brother, or uncle of the reigning king. The first Duke of York was Edmund Plantagenet, surnamed de Langley, the fifth and youngest son of Edward III., who, having been made Earl of Cambridge by his father in 1362 on reaching his majority, was afterwards created Duke of York in 1385 by his nephew Richard II. From him sprung the line known in our history as the House of York, in which the right of succession to the throne eventually came to reside, so far as it depended upon descent or birth. The right came into this line by the marriage of Richard Earl of Cambridge, second son of the first duke, to Anne Mortimer, daughter of Roger Mortimer, Earl of March, by virtue of her descent from Lionel, Duke of Clarence, third son of Edward III., whose great-granddaughter she was, inherited or conveyed to her issue, after the death of her brother Edmund Mortimer, Earl of March, in 1421, the true representation of Edward III. after the failure of the line of that king's eldest son on the death of Richard II. in 1399. The reigning king Henry VI. and his two immediate predecessors, Henry IV. and Henry V., were descended only from John of Gaunt, Duke of Lancaster, the fourth son of Edward III. The son of the Earl of Cambridge and of Anne Mortimer was Richard Plantagenet, who became the third Duke of York, and by a without issue of his uncle Edward, the second duke, slain at Agincourt in 1415. To him therefore fell the true title by descent to the throne after the death of his brother. He was slain at the battle of Wakefield, in December 1460; on which the title of Duke of York came to his eldest son Edward, who ascended the throne as Edward IV. in March the following year. After the death of Edward V. and his brother, some time in 1483, the representation of Edward IV. rested in his eldest daughter Elizabeth, who married Henry VII., and became by him the mother of Henry VIII., and also, through her eldest daughter Margaret, who married James IV. of Scotland, the ancestress of James I., who, in virtue of that descent, succeeded to the throne of England, on the failure of the line of Henry VIII., in 1603. The present royal family is descended from Elizabeth, the eldest daughter of James I., the line of his son Charles (with the exception only of Mary and Anne, the daughters of James II., neither of whom left any issue) having been expelled from the throne at the Revolution of 1688.

Since the time of Edward IV. the title of Duke of York has been

45, he published 'Some Considerations on the Law of Forfeiture for
High Treason, occasioned by a clause in the late Act for making it
treason to correspond with the Pretender's sons or any of their agents.'
The 'late act' is the act 17 Geo. II. c. 29. A 'Short Review' of
Yorke's work was published in 1746, by Thomas Gordon. Enlarged
and corrected editions of the 'Considerations' were published in 1746
and 1748. These two latter editions contain, in an appendix, remarks
on the operation of the act 7 Anne, c. 21, on the law of forfeiture in
Scotland. This work bears marks of its author's youth, but indicates
considerable talent for defining technical words and phrases, and for
stating a legal argument. In 1747 Charles succeeded his elder brother,
who was in that year elected M.P. for the county of Cambridge, in the
representation of the borough of Reigate. He married on the 19th of
May 1755, Catherine Freeman, daughter of a country gentleman of
Hertfordshire, by whom he had one son, Philip, afterwards the third
Earl Hardwicke. After her death he married (30th December 1762)
Agnata Johnston, also daughter of a Hertfordshire landowner, by
whom he had three children.

By family influence or his own abilities Charles Yorke was first
solicitor-general and then attorney-general. The latter office he re-
signed in 1761, on account of some discontent with the ministry, but
was induced to resume it in 1765. In 1770 he accepted the seals, at
the urgent request of the king, upon the resignation of Lord Camden,
but died suddenly (it was reported) on the 20th of January, while the
patent for his peerage was making out, under the title of Baron
Morden. His death was reported to have been caused by the rupture
of some internal vessel, but it is now generally believed by his own
hand. (See Earl Stanhope's 'Hist. of Eng.,' b. v., c. xlviii.)

now in the library of the British Museum.)

YOUNG, ARTHUR. Few men have acquired such celebrity as
agricultural writers as Arthur Young. His name is perhaps more
generally known all over the Continent than even in England; his
situation as secretary to the Board of Agriculture gave him a most
extensive correspondence, and his zeal for the improvement of agricul-
ture all over the world made him publish many works, in which every
new experiment and every theory suggested was examined and dis-
cussed. "To the works of Arthur Young," says Kirwan ('Irish Trans-
actions,' vol. v.), "the world is more indebted for the diffusion of
agricultural knowledge than to any writer who has yet appeared. If
great zeal, indefatigable exertions, and an unsparing expense in making
experiments can give a man a claim to the gratitude of agriculturists,
Arthur Young deserved it more than most men. We will not assert
that in all cases his conclusions were correct, or his judgment unim-
peachable; but even his blunders, if he committed any, have tended to
the benefit of agriculture, by exciting discussion and criticism."

Arthur Young was born on the 7th of September 1741. His father
was a Doctor of Divinity, a prebendary of Canterbury, and chaplain
to Arthur Onslow, Speaker of the House of Commons. The subject
of this memoir was his third son. He was educated at Lavenham
school, where he went in 1748. He showed considerable talents at
school, where he remained till 1758, when he was apprenticed to the
mercantile house of Mr. Robinson at Lynn, in the hopes of his becom-
ing in time a thriving merchant; but he had no genius for this pro-
fession, and the money, as he often lamented, which this apprentice-
ship cost, would have maintained him at college, and he might have
become qualified to hold the rectory of Bradfield, which was then held
by his father. As the rector of a large agricultural parish, there is
every reason to suppose that his latent love of agriculture would have
been fostered. He would probably have been equally zealous in this
pursuit, without so great pecuniary sacrifices as he was called on by
circumstances to make in the improvement of the small farms he
occupied; but it is most likely that he would not have been able to
extend his investigations over so wide an area, or have been induced
to give the results so largely to the world.

Having no taste for business, he took to reading at Lynn, and read
every book he could procure. At seventeen years of age he wrote a
political pamphlet, entitled 'The Theatre of the present War in North
America,' for which he got 10*l.* worth of books from the publisher—
to him a great treasure. After his father's death, which happened in
1759, he was much tempted, by the offer of a pair of colours, to enter
the army; but his mother would not hear of it, and like a good son he
gave up all thoughts of it. He began a periodical work, called the
'Universal Museum,' but dropped it after the sixth number, by the
advice of Dr. Samuel Johnson. His whole income was then consisted of a
copyhold estate of 20 acres, worth annually as many pounds. His
mother had a lease of a farm of 80 acres at Bradfield; and on her
renewing the lease, she gave him the management, and he commenced
practical farmer, without any real practical knowledge of farming, and
his head full of wild notions of improvement, as he afterwards himself
confessed. In the following year he became a contributor to the
'Museum Rusticum,' the first agricultural work he tried his pen in.
He married in the same year (1765) Miss Martha Allen of Lynn; but
from some peculiarities on both sides, this union was not very happy.
In 1767 he undertook the management, on account, of a farm
called Samford Hall, in Essex, consisting of 300 acres of land. There
he was in his element, making experiments and carefully noting them
down for five years, when he published the results in two thick vols.
8vo, under the title of 'A Course of Experimental Agriculture, con-
taining an exact Register of the business transacted during five years
on near 300 acres of various soils,' Dodsley, 1770. The style in
which this book, which, after all, is by no means instructive, was
brought out—on fine paper, large type, and wide margin—proves that
Arthur Young while were beginning to have a taste for expensive books,
or that Arthur Young had too favourable an idea of the value of his
experiments. But this work was published after his 'Tour through
the Southern Counties of England,' a work which became very popular,
and of which several editions were sold. Young was a keen observer,
and had a ready and lively mode of communicating his observations;
if he was sometimes rather hasty in his conclusions, or superficial in
his remarks, he had the talent of enlivening them by an easy and
sometimes imaginative style. An account of proceedings and experi-
ments on a poor farm, not always very judiciously planned or executed,
could not be very entertaining or instructive. After five years, in
which he suffered great losses and disappointments, he was glad to
give 100*l.* to a practical farmer to take the lease off his hands. Where
the literary and scientific farmer had failed entirely, the plain practical
cultivator saved a little fortune. It is amusing to read Young's invec-
tives against the soil, climate, and everything about this horrid farm;
but when it is considered that he only saw it from Saturday till Mon-
day, and was occupied as a parliamentary reporter the remainder of
the week, the wonder will cease, and the only surprise excited will be
caused by the fact of his finding time to note down the results of his
experiments so as to form two quarto volumes.

In the year 1768 he was induced by the success of his 'Six Weeks'
Tour,' to take another in the north of England, of which he published
a similar account in 4 vols. 8vo, which had a very great sale. The
activity of his mind could not be concentrated in agricultural writings,
but embraced subjects of general political economy; and the next
year he published a work on the expediency of a free importation of
corn, which met with great approbation in a high quarter. In 1770
he undertook his Eastern Tour, and published his observations in 4
vols. 8vo. These tours of Arthur Young excited the liveliest inte est
in all those who were connected with agriculture, either as proprietors
or tenants; and there is no doubt that his works, if they did not
kindle the rising zeal for agricultural improvements, gave it a strong
impetus, and blew it into a vivid flame. Many tours had been made
through every part of Britain, and many lively descriptions of places
had been published: but in none were the agricultural and political
circumstances of different districts accurately recorded. Wherever he
went he was received by proprietors and farmers with the greatest
frankness and hospitality. In his discussions on their different modes
of cultivating the soil, he acquired extensive practical knowledge, and
also imparted it to his hosts: by placing before them the more rational
and economical courses adopted in other districts, he led them to
make experiments; and if these, somewhat hastily conducted, did not
always give a favourable result, they always tended to make men
reflect and compare, and often led them to see their errors in manage-

Digitized by Google

ment. By means of his publications distant parts of the country became acquainted with practices which were entirely unknown beyond the small circle in which they had been gradually adopted. Even the failures, occasioned by adopting systems and rotations not suited to every soil, gave useful lessons, and pointed out the principles on which the most advantageous systems for different soils were founded. Wherever Young met with the cultivation of any peculiar plant, whether for the use of man or beast, and observed more than ordinary luxuriance in its growth, he became an enthusiastic admirer of it, and recommended it for trial to agriculturists. Of these lucerne was justly a great favourite, and he recommended its cultivation on every opportunity. Another plant which drew his attention was wild chicory (*Cichorium intybus*), the feeding qualities of which he much exaggerated, thinking it so important, that in the questions sent round by the Board of Agriculture, when he was secretary, in order to ascertain the state of agriculture in all parts of the kingdom, one of the questions was, "Do you sow chicory?" whereas this plant had only been tried by a few individuals, and soon lost its momentary reputation. We mention this circumstance to show how warmly he took up any apparent improvement and endeavoured to promote its general adoption. This seal in the cause gave a charm to his works, which were written in a lively and even imaginative style, on a subject where before nothing was met with but dry details. In 1771 he published that useful and well-known work entitled 'The Farmer's Calendar,' which has gone through innumerable editions, and is still a standard agricultural work. At the same time, as if to show the versatility of his genius, he published 'Political Essays on the present State of the British Empire,' and 'Observations on the present State of Waste Lands.' In order to increase his income, while, notwithstanding the profits of his publications, did not suffice for his expenses and experiments, he had become a parliamentary reporter for the 'Morning Post,' in which arduous task he was engaged for several years, much to the detriment of his farming operations, which he could only occasionally superintend.

In 1774 he published 'Political Arithmetic,' which work was soon translated into several foreign languages. In 1775 and 1776 he made his tour through Ireland, one of those which greatly increased his knowledge, if not of the perfections of farming, certainly of its most glaring defects in that fertile country. He dedicated the account of it to the bounty then paid by the government on the land-carriage of corn to Dublin drew the serious attention of the ruling powers to this subject. In the next session of parliament this bounty was reduced one-half, and soon after entirely abolished. For this essential service to the prosperity of Ireland, Mr. Young only received the cold thanks of the Dublin Society. He warmly supported the claims of the Roman Catholics to the removal of every political disability owing to difference of religion, showing that the penal laws then in force were laws against the industry of the country.

In 1777 Mr. Young received a medal from the Salford Agricultural Society, inscribed "For his Services to the Public." After this he undertook the management of the estates of Lord Kingsbury at Middelton, in the county of Cork, where he resided for two years in a house built on purpose for him. In 1779 he returned to his mother at Bradfield: it was then that he had the project of emigrating to America, which he relinquished in consequence of the objections of his mother. He therefore betook himself with renewed zeal to the practice of husbandry, ploughing with his own hands; while his mind was occupied in scientific pursuits, analysing soils, and making numerous experiments, for which he obtained the gold medal of the Society of Arts. In 1782 he entered into a warm controversy with Mr. Capel Loft upon the expediency of the county of Suffolk presenting the government with a 74-gun ship. This was carried on some time in the 'Bury Post,' and drew the attention of the public to that paper.

The fame of Arthur Young had now spread far and wide, and reached even the frozen regions of the North. The Empress Catherine of Russia sent three young Russians to be instructed by him in agriculture, and in the following year sent him a magnificent golden snuff-box, and two rich ermine cloaks for his wife and daughter.

In 1784 he began the publication of his 'Annals of Agriculture,' which he continued till the work extended to 45 vols. 8vo, containing a great fund of agricultural information. In this work all the contributions have the names of their authors annexed, which adds much to its authority, even King George III. condescending to send Mr. Young an account of the farm of Mr. Ducket, at Petersham, under the signature of Ralph Robinson. Among other important communications may be noticed the 'Letters on the present state of Agriculture in Italy,' by Dr. Symonds, then Professor of Modern History in the University of Cambridge. In 1785 Mr. Young's mother died; he always entertained the warmest affection for her, and in several instances, as we have seen, gave up favourite schemes in deference to her wishes.

In the spring of 1787 he received a pressing invitation to visit France, and to accompany the Comte de la Rochefoucauld to the Pyrenees, which he accepted with joy, and returned to England in the following winter. At this time a discussion took place about the Wool Bill, and the farmers of Suffolk deputed Mr. Young to support a petition against it. He was joined in this affair by Sir Joseph Banks, who was deputed from Lincolnshire for the same purpose. They did not however meet with complete success, but they caused some of the most obnoxious clauses of the bill to be modified. The manufacturers, for whose advantage it had been brought in, burned Arthur Young in effigy at Norwich for his opposition to their interest, while he was complimented by the landed proprietors and farmers. Thomas Day, Esq., the author of a well-known little work called 'Sandford and Merton,' addressed a pamphlet to Mr. Young, which was highly complimentary to his exertions.

The next summer he travelled on horseback through a great part of France, and composed his 'Agricultural Survey' of that country, which the French agricultural writers acknowledge to have opened their eyes to the imperfections of their systems of husbandry. He did not however publish it till he had made a third tour through that extensive kingdom. During the interval of the last two tours he was occupied in introducing the collecting of grass seeds by hand, for the purpose of producing artificial meadows, and, among many other useful grasses, introduced the cocksfoot (*Dactylus glomerata*) and the crested dog-tailed grass (*Cynosurus cristatus*). The style of this French tour is lively, and his descriptions amusing as well as interesting: the remarks on the condition of the people and on political subjects—the tour being made so short a time before the outbreak of the French revolution—are also both interesting and valuable.

About this time he entered into a correspondence with General Washington, which was afterwards published in a pamphlet. Another circumstance on which he dwelt with pride and complacency, was a present he received from the king of a Merino ram. In 1793 he published a pamphlet, which met with great success, entitled 'The Example of France a Warning to Britain.' He received the thanks of several patriotic associations, while the opposite party accused him of apostacy, as he had hitherto been rather inclined to favour the liberal party and approve of the French revolution, but the horrors which it brought forth entirely disgusted him. In this pamphlet Mr. Young first recommended a horse militia, which afterwards was established under the name of the yeomanry cavalry, and in which he himself served as a private in the ranks, under Lord Broome, afterwards Marquis Cornwallis.

In order to put into practice his various schemes for the improvement of waste lands, he purchased 4400 acres of uncultivated land in York shire; but unhappily for his purse, which would probably have suffered much in the experiment, the Board of Agriculture was established, and the office of secretary was offered to him. This was exactly suited to his taste and activity, and the salary of 400*l.* per annum, with a house rent-free, made the situation desirable on the score of income.

A great compliment was paid to Arthur Young, in 1801, by the French Directory, who ordered all his agricultural works to be translated and published at Paris, in 20 vols. 8vo, under the title of 'Le Cultivateur Anglais;' and in the same year M. Du Pradt dedicated to him his work called 'De l'Etat de la Culture en France.'

At the desire of the Board of Agriculture he drew up the County Reports, beginning with that of Suffolk, to which were added, in succession, Lincoln, Norfolk, Hertford, Essex, and Oxford. In 1795 he published his two political pamphlets entitled 'The Constitution safe without Reform,' and 'An Idea of the present State of France.'

The death of his daughter, which took place in 1797, of a decline, had a great influence on Mr. Young's mind. He began to turn his attention to religious subjects, which in the bustle of his secular occupations had not occupied much of his thoughts before. He began now to read and examine, and to satisfy himself as to the most important tenets of religion. This did not prevent his other pursuits, and in 1798 he published a letter to Mr. Wilberforce, 'On the State of the Public Mind,' and, in 1800, a pamphlet 'On the Question of Scarcity.' In 1804 the Bath and West of England Society adjudged their Bedfordian medal to him for an essay 'On the Nature and Properties of Manures.' In the same year he received the present of a snuff-box from Count Rostopchin, governor of Moscow, which was turned by himself out of a block of oak, and richly studded with diamonds, with the motto in Russian, 'From a Pupil to his Master.' Over the motto were three cornucopiæ in burnished gold, forming the cipher A. Y.

In 1805, at the request of the Russian Ambassador, Mr. Young sent his son to Russia, to make a survey of the government of Moscow, and drew up a report, for which he was liberally remunerated; and with the sum he received he purchased an estate of 10,000 acres of very rich land in the Crimea, and settled there.

In 1808 Mr. Young received a gold medal from the Board of Agriculture "for long and faithful services in agriculture," soon after which his exertions were much checked by the loss of his sight. No longer able to take his usual exercise, his digestion became impaired, which no doubt led to the disease which terminated his useful earthly career. His disease was not suspected till about a week before his death. He had always had a great dread of blindness, and of the stone in the bladder: the latter was the cause of his death, but he never was aware of it, and by the care of his medical attendants his sufferings were alleviated, and he was spared those acute pains of which he had such a dread. He died on the 12th April 1820, in the eightieth year of his age. He was buried at Bradfield, in a vault in the churchyard.

Few men have acquired so great a reputation in the pursuit of the useful arts, especially in agriculture, as Arthur Young. He began as a scholar and became a master. If he was sometimes led on by a sanguine disposition and lively imagination into doubtful theories, he corrected this by the faithful details of his experiments. He cannot be said to have founded any new system of agriculture, but he has collected and brought forward all the improvements made by different individuals, and thus diffused an immense mass of practical knowledge, which before was scattered and isolated.

" YOUNG, BRIGHAM, the president and 'prophet' of the Mormons or Latter Day Saints. In our notice of the founder of Mormonism [SMITH, JOSEPH, vol. v., col 551.] we gave a brief sketch of the progress of the system to Smith's death, and referred the reader to the present article for an account of "its subsequent development and present state ;" this we shall now endeavour briefly to supply.

Of Brigham Young himself we have few authentic particulars. He was born about 1800, and was for some years the trusted friend and colleague of Joseph Smith. On the murder of Smith (June 27, 1844) Young was elected his successor as president of the society, or "prophet and revelator." The measures he adopted fully justified the choice. He saw that a contest with the people of Illinois, backed by the state, and perhaps by the federal government, would be utterly hopeless, and he not only applied himself to calm the excited minds of the community, but as soon as it became clear that the Mormonites would not be permitted to remain in Nauvoo, he took the bold resolution of persuading them to emigrate to an entirely new and unappropriated country far beyond the settlements of the most adventurous of his countrymen, and separated from them by a vast desert tract and the almost impassable Rocky Mountains. Having obtained the promise of a short respite for the main body of his people, Young sent forth in February 1846 the first band of 'pioneers,' to prepare a way across the dreary wilderness. The perils and sufferings of this bold band were of the most dreadful kind; but they struggled on bravely, planting crops and by various means smoothing the way for the brethren, who were to follow. It was not till July 1847 that the pioneers reached their destination—the Valley of the Great Salt Lake —then a nearly sterile tract inhabited only by a few scattered Indians. The main body of emigrants had to encounter less than the hardy pioneers, but their sufferings were very great, and a large number died on the way.

In the article UTAH in the Geographical Division of the English Cyclopædia an ample description is given of the country, and an account of the settlement, &c.; here therefore it will only be necessary to state that immediately on their arrival the elders proceeded to lay out their city to which they gave the name of the 'City of the Great Salt Lake' (but which is now usually called Salt Lake City), and to organise a government, at the head of which they placed Brigham Young. The country was a part of the northern provinces of Mexico, and still nominally belonged to that republic; but it was in February 1848 formally ceded to the United States of North America. As soon as the cession was made the Mormons proceeded to form their country into a state, drew up a constitution, elected a body of laws, and chose the usual state officers. Brigham Young being governor, and formally applied for admission into the Union as the sovereign state of Deseret. Congress however refused the prayer, and 'remanded' the state back to a territorial condition, entitling it the 'Territory of Utah.' By the Federal Constitution the appointment of territorial officers is vested in the President of the Union. President Fillmore however waived his right, or so used it as not to interfere with the proceedings of the 'Saints.' Young was continued governor, and the entire authority, civil as well as ecclesiastical, became vested in him. Armed with this double authority he devoted himself to the firm establishment of the settlement, the extension of the church, and the consolidation of the system.

The valley of the Salt Lake was, as we have said, chosen for the 'earthly Zion of the Saints,' because of its distance from any civilised settlement, and because there the community would be, as it were, naturally separated from every other people by the physical conformation of the country—a valley or series of valleys surrounded by almost impassable mountains and wide deserts. Young felt that his only chance of building up such a theocracy as his predecessor had conceived lay in keeping his people beyond the observation and the reach of any community who held any form of Christian creed or established polity. Once firmly settled he doubted not that he should be able to keep out any 'Gentile' intruders. But, happily as Utah seemed chosen for his purpose, a circumstance occurred which to a great extent overturned his calculations. The discovery of gold in California led to an immediate rush of immigrants to that country, and the City of the Salt Lake lay in the direct line of the overland route. It was of course impossible to arrest or to divert the stream. After some futile attempts to prevent intercourse, the elders seem to have decided to make the best of what could not be avoided, and a profitable trade was established with the travellers. The prosperity of Utah has, there can be no doubt, been greatly increased by this traffic, but it has led to the settlement of numerous 'Gentiles' in the territory, and otherwise been a constant source of vexation and perplexity to the authorities.

Brigham Young was not continued in his office as governor by Fillmore's successor in the presidency; but for some time no very serious consequences ensued from the changes which were made, the officers sent acting willingly with the Mormon authorities. But later in Pierce's presidency, judges were appointed who were dissatisfied at seeing their judgments, where 'Saints' were concerned, virtually set aside by the superior authority of the prophet. Young moreover, when the time for the election of a new president approached, took a decided part in opposition to Mr. Buchanan. Charges of various kinds were accumulated against him by the federal officials, who at last in a body withdrew and laid their complaints before the president. Mr. Buchanan has, it appears, determined on the adoption of decided measures. A body of federal troops, it is said 2,500 in number, has been despatched to Utah to restore there the federal authority. On the other hand Young and the legislative assembly of Utah protest on behalf of the Mormons the utmost loyalty to the Union, and their readiness to receive such officers as may be content "to attend to their own duties," but assert their firm determination to resist the intrusion of any 'outside' officials who shall be thrust upon them "in defiance of their constitutional rights." What precise form the dispute may take, and whether it will be permitted to proceed to extremities, or Young as before, at the last moment, counsel submission to constituted authority, or a new migration, remains of course in the future. Meanwhile the Mormons are everywhere watching with intense anxiety; and it may be noticed as an illustration of the serious phase which the proceedings have assumed, that after continually urging emigration, the Mormon authorities in England have suddenly put a peremptory stop to it. In the 'Millenial Star' of October 17, 1857, they announce that "in view of the difficulties which are now threatening the Saints we deem it wisdom to stop all emigration to the States and Utah for the present."

Young has been singularly successful in maintaining his influence. Despite of opposition and reproach, the attachment of his followers seems unbounded, and their confidence unshaken. They seem as bold as firm a way as ever did Joseph Smith himself. Mr. Chandless, an English traveller, who spent the autumn and winter of 1855 in Salt Lake City, describes Young as "a portly man of middle height, apparently about fifty-four; his face bespeaks common sense, and when in his proper place he was spoken of as the greatest and ever-ready. I tried —but in vain—to discover any sign of contempt in his countenance. . . . He never flatters the people, nor apes the supposed mien and language of a prophet. . . . He rather affects coarse and common language. . . . He is in shrewdness and energy well fitted to be the leader, though by no means the most intellectual or most eloquent in the 'Church.'" This character, drawn by an intelligent observer, is borne out by what is known of his general conduct and by his printed 'discourses. In these (which are published by the authorised reporters, Elder G. D. Watt, 'Journal of Discourses by Brigham, Young, President of the Church of Jesus of Latter Day Saints, his two Counsellors, the Twelve Apostles, and others,' and which is the authoritative "exposition of the views and policy of the Church ") we have the best illustration of the character of the man, and the clearest insight into his doctrines. In one of these discourses he says: "Do you ask who brother Brigham is? He is an humble instrument in the hands of God, to keep His people in the path which He has marked out through the instrumentality of his servant Joseph; and to travel in which is all I ask of them. I said some time since on this stand, if I was not a Prophet I certainly have been profitable to this people. I know I have, by the blessing of the Lord, been successful in profiting them. The Lord has done it through me." But besides this plain, blunt, almost jocular style, which he uses when preaching as well as when advising, there is another which shows how tightly he holds the reins, and the means by which he keeps in check a people who look up to him as their divinely appointed ruler. In his 'Discourse delivered in the Bowery, Great Salt Lake City, June 15, 1856, for instance, we come upon such a passage as this ('Discourses,' iii. p. 337), "You recollect that last Sabbath, and two weeks ago to-day, I told the people that it would be for their good to go and perform a certain piece of work, which was just as much revelation to you as would be teachings upon the subject of getting your endowment [a higher kind of initiation]. It was like, and was upon the principles of eternal lives. I recollect telling you when you lift your hands to heaven like that [raising his hands], and say that you will perform thus and so, and do not, that such a course would damn you, as sure as you are now living. . . . I am almost constrained by the power that is within me to draw the dividing line in the midst of this people, and to cut many from the Church, but I plead for mercy. I have mercy for the people, and I ask God to bear with the wickedness there is in their midst, which can hardly be borne with by the spirit and power of the Holy Ghost." And not only does he thus hold out to the people that he possesses the power of cutting them off from eternal life, but he claims the gifts of foreknowledge, and of something approaching omnipresence—at least, we find him declaring (October 6, 1854) " it is a hard matter for a man to hide himself from me in this territory; the birds of the air they say carry news, and if they do not I have plenty of sources of information." It is easy to understand that among a people who receive such teaching, there is likely to be little opposition, as there can be little inquiry. But interference of any kind with the government is systematically discouraged by him.

Digitized by Google

The burden of his teaching is, "Do your duty and leave us to do ours; cleave to the truth,—and let the brethren come and pay their labour tithings." "Do those things which are necessary to be done, and let those alone that are not necessary, and we shall accomplish more than we do now;" or, as he condensed it in what is printed at the head of the 'Mormon' as "the Mormon's creed"—"Mind your own business."

Mormonism owes its present shape to the genius of Brigham Young. Taking the latest official 'Account of the Faith and Doctrines of the Church,' as we find it in the 'Mormon' of May 9, 1857, there appears little more than a somewhat obscure expansion of the creed as left by Joseph Smith, which we gave in vol. v., col. 556. But it contains the express declaration, "we believe that God will continue to give revelations by visions, by the ministry of angels, and by the inspiration of the Holy Ghost, until the Saints are guided into all truth;" and with this assertion of continuous revelation, it must be remembered that Young is the 'prophet and revelator' through whom all revelation must proceed or be sanctioned. The creed and even the 'sacred' writings of such a sect must, it is evident, be only of secondary importance; and accordingly, the Book of Mormon seems to be now by general consent seldom referred to: Young's revelations have in fact superseded it. Among the more important deviations from the received doctrines of Christianity which have become primary articles of Mormon faith under Young's revelations are—that the Supreme Deity is a material being having flesh and bones like ourselves, and he made man; that there "are Gods many" of an inferior order; that man pre-existed in a spirit world; and that for the building up of the church Saints are, as in the first dispensation, to have 'sealed' to them "plural wives." This last, from its contradiction to the very spirit of Christianity and the whole system of civilisation, and from the importance which Mormons themselves attach to it, has come to be very naturally regarded as the distinctive feature of the system. It may not therefore—as it is to Brigham Young that its adoption by the body (if not its introduction) is undoubtedly due, and as we referred to this article for information on the subject—be out of place to show exactly how he teaches it. The doctrine itself of the duty of the Saints to take a "plurality of wives" he declares was not his own invention or his own seeking. It was revealed to him by Joseph Smith, and he received it with the deepest belief. "I was however told," he says ('Journal of Discourses,' iii. 266), "of shrinking from any duty, nor of failing in the least to do as was commanded, but it was the first time in my life I had desired the grave, and I could hardly get over it for a long time. . . . And when I saw a funeral, I felt to envy the corpse its situation, and to regret that I was not the coffin," &c. Having received the revelation however he did not "shrink from the duty," and he is said to have several wives and numerous children. He himself, in a speech delivered at the Bowery, Salt Lake City, July 14, 1855 (reported in 'Deseret News,' iii. 265), says, "I can recollect that I had had the privilege of having only one wife, I should have had only three sons, for these are all that my first wife bore; whereas I now have buried five sons and have thirteen living." The doctrine is however not for the outside world, but only for the Saints. He says, "This law was never given of the Lord for any but His faithful children; and it is not for the ungodly at all. No man has a right to a wife or wives unless he honours the Priesthood and magnifies his calling before God." But it is a doctrine which must not be gainsaid. In his discourse on 'Marriage Relations' he has the hardihood to declare—"Now, if any of you will deny the plurality of wives, and continue to do so, I promise that you will be damned; and I will go still further, and say, take this revelation, or any other revelation that the Lord has given, and deny it in your feelings, and I promise that you will be damned." This 'plurality of wives' is however only a part of what he calls the doctrine of 'marriage relations,' which is the very life of the system; but we have neither space nor desire to pursue the subject further. The importance he attaches to it may be seen from a brief quotation:—"I say that the subject of the marriage relation is not in my reach, nor in any other man's reach on the earth. It is without beginning of days or end of years; it is a hard matter to reach. We can tell some things with regard to it: it lays the foundation for worlds, for angels, and for the Gods; for intelligent beings to be crowned with glory in immortality and eternal lives. In fact it is the thread which runs from the beginning to the end of the holy Gospel of salvation—of the Gospel of the Son of God—it is from eternity to eternity."

It would probably be a mistake, notwithstanding all that has been said on the subject, to suppose that the practice of polygamy is general in Utah. 'Plural wives,' as we have seen, can only be sealed to Saints; and as the maintenance of families is expensive in Utah, and by law a separate room must be provided for each wife, it will be obvious that prudential considerations will in some measure keep down the practice—a fact indeed which Young himself laments in one of his addresses. Moreover at the Census of 1850 there was a considerable majority of adult males, and the disparity of the sexes has gone on increasing since. It is probable therefore that the practice chiefly prevails among (if it is not confined to) the 'riper saints' and persons in comparatively affluent circumstances. Mr. Chandless, an acute observer and an impartial writer, says, "Judging from those families with which I have been more or less acquainted, and also from the build of the houses (which last, though of course uncertain, is a better test than might be supposed), I should conjecture the polygamist households throughout the city to be in a decided minority." Of the tendency of the system to lower the tone of domestic morality and to degrade female character, and of its evil consequences in every respect, there can, we suppose, be no doubt; but it is only just to say that the accounts in popular works of fiction of its leading to gross and open profligacy are contradicted by the testimony of all trustworthy witnesses. On this writers like Stansbury, Gunnison, Carvalho, and Chandless are agreed, however they may differ in opinion as to the tendency of particular portions of the system and the character of the leaders. It must be remembered too in connection with this point, that the Mormons hold that, along with the doctrine which they profess to receive as it was received under the 'first dispensation,' they must adopt in spirit, and as soon as permitted in letter also, the safeguards with which that 'marriage relation' was fenced about by the laws of Moses, and that punishment by death ought inevitably to follow any infraction of them; and, as shown in a noted instance, of which the particulars have been published by authority, where the injured individual under the present "imperfect civil law" takes the law in his own hands, no jury in Utah would do otherwise than declare him innocent.

Since the arrival of the Mormons in Utah, Brigham Young appears only to have quitted the territory once, when he came on a mission to the Saints in England. He has continued in reality the sole ruler and law-giver of the people—directing the movements of the society; the establishment of new settlements, which he constantly visits to advise or reprove the brethren, as may be necessary (and he has a sharp tongue); deciding in cases of ultimate appeal all disputes among his brethren, who are enjoined not to carry their differences before 'gentile' judges; and he is always accessible to individuals who may require advice on their spiritual or temporal concerns. Under his energetic guidance settlements have extended "more or less thickly in a line from north to south of 360 miles, along a valley varying from rim to rim of the basin." In these are included several 'cities,' but they are all, except Salt Lake City, mere collections of ill-connected adobe dwellings, and Salt Lake City itself has few stone buildings. There are however large places of amusement in it—dancing being almost a religious institution—mills, &c. The temple, which is intended to surpass the famous temple of Nauvoo in splendour as well as in size (it is 130 feet by 120), is built up to the basement. One of the chief buildings in Salt Lake City is Brigham Young's house, which is large, and has "another building almost detached—a sort of harem—just completed in the orthodox gothic style." (Chandless.) Of the population of the territory there has been no census published since that of 1850, which was confessedly imperfect, when the number returned was 11,380. It has since greatly increased, and in the 'Millennial Star' for October 18, 1856, the authorised information received from Salt Lake City, August 1857, estimated at 80,000, of whom 60,000 are Mormons: but these numbers are probably in excess. The population of Salt Lake City was estimated by Mr. Chandless in 1855 at "nearly 15,000:" in 1850 it was about 5000. The Mormons have been "gathered from all parts of the earth," and it has been frequently stated in American newspapers that the majority are English. But there can be little doubt that the majority are American. At the Census of 1850, of 11,380, the entire population, only 2134 were "born in foreign countries," and there is no reason to suppose that the proportions have since been materially altered. It must however be confessed that Mormonism has taken hold of a large number of our people. Mormon preachers and Mormon meeting-houses are to be found throughout England, and Mormon publications have a considerable circulation. Still more numerous comparatively are the converts in Wales, and to what extent Mormon ideas are being circulated there may be imagined when we say that we have before us a list of 44 Mormon publications in the Welsh language. Of the 'trains' of Mormon emigrants who leave this country for Utah, a large proportion are always Welsh; it is stated that they are forming distinct settlements in some of the smaller valleys, where they retain their old habits and speak almost exclusively the language of the Principality. At the Census of 1851 there were in England and Wales 2292 places of worship belonging to the body, most of them however being merely rooms. . . . . The attendance on the Census Sunday was—morning, 7517; afternoon, 11,481; evening, 16,628." The Mormon authorities stated their numbers in 1855 at upwards of 30,000, but we have no adequate means of judging of their subsequent increase or decrease. This country however is not the only one from which disciples are drawn. Missionaries are constantly sent to all parts of Europe, to India, Australia, and even to the Sandwich Islands. Among the Saints in Utah are many Danes and Germans, and some Frenchmen and Italians. All the brethren on entering Utah have to present to the Church a tithe of their property, and subsequently to contribute a tithe of their income, and also a 'labour tithing,' but for the last they may provide a substitute.

YOUNG, EDWARD, was born in 1684 (and not in 1681, as is said by Herbert, Croft, Chalmers, and other authorities) at Upham, a village about eight miles from the city of Winchester, in Hampshire. His father, the Rev. Edward Young, was born in 1643, was educated at Winchester College, of which he became a Fellow, was rector of Upham, was collated in 1692 to the prebend of Gillingham Minor in

Digitized by Google

the cathedral of Salisbury, was afterwards appointed chaplain to William and Mary, and was finally preferred to the deanery of Salisbury. Dean Young died at Salisbury in 1705. He published a collection of his sermons in 1702, 'Sermons on several Occasions,' 2 vols. 8vo, of which a second edition was printed in 1705.

Edward Young, author of the 'Night Thoughts,' was placed by his father on the foundation at Winchester College, where he remained till he was nineteen without having been elected to a fellowship in New College, Oxford, which he entered as an independent member, October 13, 1703 ("at the age of nineteen" according to the University Register). A few months afterwards, on the death of the warden, who was a friend of his father, and with whom he resided, he removed to Corpus Christi College on the invitation of the president, who was also one of his father's friends. In 1708 he was nominated by Archbishop Tenison to a law fellowship in All Souls College, where he seems to have devoted himself to poetry in preference to law, and to have adopted those decidedly religious principles which he retained through life. Tindal, who frequently visited All Souls, speaking of him, says, "The other boys I can always answer, because I know whence they have their arguments, which I have read a hundred times; but that fellow Young is always pestering me with something of his own."

Young published, in 1713, a poetical 'Epistle to George, Lord Lansdowne,' who was one of the twelve peers created by Queen Anne in 1712. He also published, in 1714, 'The Force of Religion, or Vanquished Love;' both of which are poems of considerable length. 'The Last Day' is in three books, and part of it was printed in 'The Tatler,' in 1710; so that he had been writing poetry for some years before he published any.

On the 23rd of April 1714, Young took the degree of B.C.L., and in the same year published a 'Poem on the Death of Queen Anne,' London, folio. He was probably in some estimation for his learning as well as his poetry, for when the foundation of the Codrington Library was laid, he was appointed to deliver the Latin oration, which he published, 'Oratio habita in Coll. Omnium Animarum cum jacta sunt Fundamenta Bibliothecæ Chichleio-Codringtonianæ,' Oxon., 8vo, 1716.

On the 10th of June 1719, he took the degree of D.C.L. In the same year his tragedy of 'Busiris' was acted at Drury Lane with considerable success; and he published a 'Paraphrase on Part of the Book of Job,' 4to; and a poetical 'Letter to Mr. Tickell, occasioned by the Death of the Right Hon. Joseph Addison,' folio.

Young had been tutor to Lord Burleigh, son of the Earl of Exeter, but having become acquainted with the Duke of Wharton, he was, in 1719, induced by that nobleman to relinquish this situation. This fact was proved in the case Stiles v. Attorney-General (Atkyns, 'Chan. Rep.,' vol. 2, 1740), in which Lord-Chancellor Hardwicke was required to decide whether two annuities granted to Young by the Duke of Wharton, were for legal considerations. The deed for the first annuity was dated March 24, 1719; in the preamble of which the duke states, that, "Considering that the public good is advanced by the encouragement of learning and the polite arts, and being pleased therein with the attempts of Dr. Young, in recommendation thereof and of the love I bear him," &c. Lord Hardwicke decided that this was not a legal consideration. The annuity was 100*l.* for life; but the payments having fallen into arrear to the amount of 350*l.*, the duke, in lieu of this debt, gave him a second annuity of 100*l.* in addition to the first: the deed for the second was dated July 10, 1722, and the duke afterwards charged both as one annuity of 200*l.* a year for life on certain property. The duke died in 1731, in Spain, in great poverty, his property had been in trust some years before his death, and the other creditors resisted Young's claims. Young stated in his examination before the Master, February 4, 1730, that he had been offered an annuity of 100*l.* for life if he would continue tutor to Lord Burleigh, but that he refused it in consequence of the Duke of Wharton having promised to provide for him in a more ample manner. Lord Hardwicke decided that his refusal of this offer and the debt on the first annuity were both legal considerations, and he directed the 200*l.* annuities to be paid out of the trust-estates. It also appeared that, besides these two annuities, the duke gave him a bond, dated March 15, 1721, to remunerate him for the expense which he had incurred in standing, at the duke's request, a contested election for Cirencester, in which he was defeated. No doubt the duke thought that he had talents to qualify him for an orator, and in fact he afterwards became an eloquent preacher. Lord Hardwicke decided that this bond was not for legal consideration, and it was not ordered to be paid.

The tragedy of 'The Revenge' was brought out at Drury Lane in 1721, with less success than 'Busiris.' His Satires were published separately in folio, with the title of 'The Universal Passion,' which was afterwards expanded into 'The Love of Fame, the Universal Passion.' The first four, which are on men, were published in 1725-6; the two last, on women, in 1727-8. They were extremely successful. Herbert Croft says that Young acquired 3000*l.* by them, but leaves it uncertain how the whole sum was obtained, by stating, on the authority of Spence, that the Duke of Grafton gave him 2000*l.* for them. In 1726 he published 'The Instalment,' on Sir Robert Walpole being made a knight of the Garter.

In 1727 Young took orders, and was nominated one of the royal chaplains. He immediately withdrew his tragedy of 'The Brothers' from the players, who had it in rehearsal. In 1727 he published 'Cynthio, an Ode on the Death of the Marquis of Carnarvon;' in 1728, 'Ocean, an Ode, with a Discourse on Lyric Poetry,' to which was prefixed an 'Ode to the King, Pater Patriæ,' and 'A True Estimate of Human Life;' in 1729, a Sermon, preached before the House of Commons, entitled 'An Apology for Princes, or the Reverence due to Government.'

On the 30th of July, 1730, the college of All Souls presented him with the rectory of Welwyn in Hertfordshire, valued at 300*l.* a year, and to which the lordship of the manor was attached. In this year he published 'Imperium Pelago, a Naval Lyric;' 'Two Poetical Epistles to Mr. Pope, concerning the Authors of the Age;' and 'A Sea-Piece,' addressed to Voltaire, with whom he seems to have been on terms of familiarity when Voltaire was in England.

In 1731 Young married Lady Elizabeth Lee, widow of Colonel Lee, and daughter of the Earl of Lichfield. By Lady Elizabeth Young he had a son, Frederic, who was born in 1733. Lady Young had a daughter by her former husband, who was married in 1735 to Mr. Temple, son of Lord Palmerston. Mrs. Temple died of consumption in 1736, at Lyon, on her way to Nice. She was accompanied by Young, and probably by her husband and Lady Young; for Croft says that "after her death, the rest of the party passed the ensuing winter at Nice." Mr. Temple died in 1740. Lady Elizabeth Young herself died in 1741. The Philander and Narcissa of the 'Night Thoughts' have been supposed to represent Mr. and Mrs. Temple. The authorities at Lyon refused to allow Mrs. Temple to be buried in consecrated ground, and this fact accords with Young's description of the funeral of Narcissa; but the dates just stated are inconsistent with the third of the following lines:—

> "Insatiate archer! could not one suffice!
> Thy shaft flew thrice, and thrice my peace was slain,
> And thrice ere thrice yon moon had filled her horn."

Lady Young's name in the poem seems to be Lucia. The Lorenzo could not have been Young's son, as has often been stated; for Frederic Young, having been born in 1733, was under ten years of age when the first books of the 'Night Thoughts' were published, while Lorenzo is represented as having been married to a lady whose name in the poem is Clarissa, and who died in childbed, leaving a son, Florello.

Young seems to have begun the 'Night Thoughts' soon after the death of his wife. They were published in separate parts, 1742-45. In 1753 he brought out his tragedy of 'The Brothers,' the profits of which he intended to give to the Society for the Propagation of the Gospel, but the play having been unsuccessful, he gave the Society 100*l.* His prose work, 'The Centaur not Fabulous, in Six Letters on the Life in Vogue,' was published in 1755. There is a letter from Secker to Young, dated July 8, 1758. Secker was then Archbishop of Canterbury, and Young, at that time seventy-four years of age, had been soliciting the archbishop to use his influence with the king to obtain some preferment for him. Secker's letter is characteristic. He excuses himself by saying, "No encouragement hath ever been given me to mention things of this nature to his majesty;" and concludes by observing, "Your fortune and your reputation set you above the need of advancement, and your sentiments above that concern for it, on your own account, which, on that of the public, is sincerely felt by," &c. Young would understand, if he did not feel, Secker's allusion to the inconsistency between his 'sentiments' and his solicitations for worldly advancement. His 'Thoughts on Original Composition' were published in 1759. At last, on the 4th of January 1761, his ruling passion received a slight gratification—he received Dr. Stephen Hales as clerk of the closet to the Princess Dowager of Wales.

His poem called 'Resignation' was published in 1762, and in the same year he published a collected edition of his Works, 4 vols. 12mo, from which he excluded some of his dedications, as well as two or three of the smaller works. He died on the 12th of April 1765. He had performed no public duty for two or three years, but retained his faculties to the last.

Young's son Frederic was educated at Winchester, whence he went to New College, Oxford, and then to Balliol College, from which, according to the 'Biographia Britannica,' he was expelled for misbehaviour. According to the same authority, Young was so much incensed at his son's misconduct that he refused to see him, even on his death-bed, but left him the bulk of his fortune, which was considerable. He left 1000*l.* to his housekeeper, and added a codicil, in which he requested that she would destroy all his manuscripts after his death, "which would greatly oblige her deceased friend." He had left another 1000*l.* "to his friend Henry Stevens, a latter near the Temple Gate," but Stevens died before him. Young's son erected a monument "pio et gratissimo animo" to his father and mother.

Young, from the commencement of his career as a writer almost to the termination of his long life, displayed an eager desire for place and preferment, and seems never to have let slip an opportunity of paying his court to those who had them at their disposal. Every work, whether in prose or verse, each separate satire of 'The Love of Fame,' and each separate book of the 'Night Thoughts,' was addressed to some person of distinction, including Queen Anne, George I., and

Digitized by Google

George II., and generally in language of the most unscrupulous adulation. Place, after all, he never obtained, and, except the offices of royal chaplain and clerk of the closet, the only preferment which he ever reached was the rectory of Welwyn, and that was given to him by his own college of All Souls.

Young's private character has not been minutely described. Croft went to the residence of his housekeeper in order to obtain information from her, but she had died just before his arrival. After his marriage he lived much in retirement at Welwyn, "the world forgetting," and long enough to be almost "by the world forgot." He seems to have been visited by few, but Count Tacharner, a foreigner, who spent four days with him when he was very old, says that everything about him was very neat, his manners very polite, and his conversation lively and entertaining. He was also exact in the performance of his religious duties, domestic as well as public. His accustomed walk of meditation was among the tombs of his own churchyard, but he does not appear to have been severe or gloomy; he was fond of gardening, and his parishioners were obliged to him for a bowling-green and an assembly-room.

The distinguishing characteristic of Young's intellect was the fertility of his fancy; but the imagery with which it was supplied and the manner in which that imagery was combined, were such as to qualify him for a wit rather than for a poet. He has apparently no taste for the beauties of external nature, but he has metaphors, similes, and laboured comparisons drawn from all kinds of sources, in extraordinary abundance. The combinations are always original, often beautiful, sometimes brilliantly acute, but too frequently introduced merely as ornaments, unnecessary for illustration and unsuitable to the circumstances in which they are used or the effect which he intended to produce. This want of skill in the adaptation of means to the production of a specific effect was perhaps the leading defect of his poetical character. But he has another defect, which, though of much less consequence, would have disqualified him from ever becoming a great poet. His versification is that of a versifier, not of a poet; correct in the adjustment of feet, but broken up into couplets, lines, and half-lines, and almost utterly devoid of the melody of rhythm. His favourite form of language is antithesis, which may be suitable enough for the wit, but is little suited to the poet. It must be admitted however that his language is often very compact, and his lines have frequently a pregnant brevity which gives point and force to his illustrations.

'The Last Day' consists of a series of descriptions of the wonders which are to attend the destruction of the universe, of the terrors of the wicked, and the raptures of the virtuous. Sublimity is generally aimed at, but never reached; there is much of violence and extravagance instead of it. The versification is elaborate in the highest degree not musical, and the effect of the whole is tedious. 'The Force of Religion' is a poetical dialogue between Lord Guildford and Lady Jane Grey previous to her execution. The pathetic is evidently aimed at in this poem, but pathos was never at the command of Young. Lady Jane is too heroic, and the thoughts and language too much unlike real feeling, to produce either interest or pity. 'The Paraphrase on a Part of the Book of Job' appears as if it had been written by a man of genius out of his senses. The Eastern imagery of the original is strong enough for most European tastes, but is tame compared with Young's paraphrase. The descriptions, when wrought out in detail, as they are by Young, instead of being, as no doubt he intended, specimens of magnificent imagery, are extravagant to a degree of absurdity which is absolutely without parallel in English poetry.

'The Love of Fame,' being a series of satires, required a species of composition much better suited to the peculiarity of Young's talents than anything he had hitherto attempted. They have been described as a series of epigrams, and so they are, but epigrams so connected with character and manners, as to have an interest which never belongs to isolated epigrams, such as those of Martial. They display no deep insight into character, no investigation of motives, but exhibit the surface of life by a series of sketches, often slight and generally superficial, but true, and spirited, and sparkling with illustrative touches; and though much of the manners which they describe has passed away, they are still perfectly intelligible and very amusing. In poems of this kind, even Young's peculiar taste for antithesis, and his short and broken style of versification, can hardly be regarded as objectionable.

The 'Night Thoughts' are a series of argumentative poems in blank verse, in proof of the immortality of the soul and the truth of Christianity, and, as a consequence, the necessity of religious and moral conduct. Young's exhibitions of life are those of a man who had mixed with the world, and observed it well; and though they are generally somewhat gloomy, and touched with the exaggerating pencil of the satirist, they abound in important truths. There is no narrative, or next to none, but a slight degree of interest is given by the allusions to Narcissa and Philander and Lucia, and by the introduction of Lorenzo, who seems to be the poet's personification of the accomplished man of the world, whose infidelity was to be silenced by argument, and the erroneousness of whose conduct was to be made manifest by contrast with that of the Christian. In the descriptions, the false sublime is of much more frequent occurrence than the true. The blank verse is generally broken up into short sentences, and seldom satisfies the ear. The poem would have little attraction for the general reader if it were not for the abundance, superabundance, we may say, of its illustrative ornaments.

'The Centaur not Fabulous' is a satire in prose, an exaggerated display of the life 'in vogue,' as he expresses it. The 'Remarks on Original Composition' were addressed in a letter to Richardson the novelist, and though written when Young was very old, they are not only full of good sense, but sparkle with illustrations as much as if they had been written in the prime of life; they are rather gossiping perhaps, but very entertaining.

Young wrote several Odes, some expressly "in imitation of Pindar's manner. They are all signal failures. He has discarded his ornamental contractions, probably as unsuitable to the dignity of the ode, and he has nothing in the place of them. The thoughts are either common or bombastic, and the versification is only fit for nursery rhymes. The last of his poems, 'Resignation,' consists of a series of verses written in a familiar style, and though subdued in tone, indicates no decay of his powers.

The three tragedies are all of the heroic class. The characters are above nature or out of it, and their thoughts and language being alike unknown to ordinary humanity, they excite no sympathy. 'The Revenge' however still keeps possession of the stage whenever an actor appears who is capable of displaying the exaggerated but magnificent passion of Zanga. The plot is an imitation of that of Othello; it has more incident than either of the other tragedies, and the thoughts and language are nearer to those of actual life.

YOUNG, MATTHEW, D.D., Bishop of Clonfert, and a distinguished mathematician of Ireland, was born in 1750, in the county of Roscommon, and he prosecuted his studies at Trinity College, Dublin, into which he was admitted in 1766. While a student he applied himself diligently to the ancient and modern languages, to divinity, and, in a particular manner, to mathematics and natural philosophy. The 'Principia' of Newton constituted at that time the chief text-book for the latter subject in the British universities, and Mr. Young spent a considerable portion of his life in illustrating it, with the view of diminishing for students the difficulties arising from the extreme conciseness of the investigations. He entered into holy orders, and in 1775 he was elected a Fellow of the college, after an examination in which he distinguished himself by his profound knowledge of the important work just mentioned: the degree of Doctor in Divinity was subsequently conferred upon him.

In 1782, the professorship of natural philosophy becoming vacant, Dr. Young was immediately appointed to hold the office, and he applied himself zealously to the fulfilment of its duties. He greatly extended the course of instruction in that branch of science, availing himself, for the purposes of illustration, of a collection of valuable apparatus which had then been recently purchased for his college.

Dr. Young is said to have taken great pleasure in the society of literary and scientific persons; and early in life he became connected with several other young men who, like himself, were students at the university, for mutual improvement in those pursuits. Subsequently a more numerous society was formed, chiefly by his exertions, and this became the nucleus of the Royal Irish Academy, the members of which professed to have for their object the advancement of arts and sciences as well as polite literature and antiquities. They began in 1782 to hold weekly meetings for the purpose of reading essays on these different subjects; and the first volume of their 'Transactions,' which is for the year 1787, was published in 1788. The volumes have since come out regularly, and several of the earliest contain the mathematical and philosophical papers which were contributed by Dr. Young.

The reputation acquired through his literary and scientific attainments was the cause that Dr. Young was, without solicitation, appointed by Lord Cornwallis (the lord-lieutenant) to the see of Clonfert, which became vacant in Dr. Woodhouse's death. In consequence of the 'Principia' of Newton, which the doctor had been long preparing in English, and which he afterwards, on the representations of his friends, translated into Latin, was completed a short time before he was raised to the episcopal bench; the publication was however unavoidably delayed on account of the new duties arising from this appointment, and before the bishop had leisure to carry out his intention a cancer began to form on his tongue. Under this painful malady he languished during fifteen months, and he died November 23, 1800, being then at Whitworth in Lancashire.

The principal contribution made by Dr. Young to the 'Transactions of the Royal Irish Academy' is a paper on the velocities of effluent fluids, which is published in the seventh volume. In this paper it is shown that when a tube of any length, open at both ends, is inserted vertically in a vessel so as to terminate on its bottom, and the vessel is filled with water to any level above the top of the tube, the velocity of the effluent water is increased, when compared with that of water issuing from the vessel through a simple orifice of equal diameter in the bottom, nearly with the square root of the length of the tube, the depth of water in the vessel being equal; and the cause of this remarkable circumstance is ascribed to the excess of the pressure downwards above the pressure upwards, within the tube, being greater than it is at equal depths of water when no tube is employed. Thus, a lamina of water at the top of the tube is pressed downwards by the

Digitized by Google

weight of the atmosphere, together with that of the column of water above it, and upwards by the equal pressure of the atmosphere at the lower end of the tube, diminished by the weight of the column of water in the tube; therefore the resulting pressure on that lamina downwards is equal to the weight of a column of water whose height is equal to the entire depth of the water in the vessel. All the fluid in the tube descends with the same velocity; whereas, with a simple orifice at the bottom, each lamina of water in the vessel descends with a velocity depending merely on the weight of the column of fluid above it: the sides also of the tube prevent the lateral particles of water from oocverging towards the orifice, by which the discharge of the fluid through a simple orifice is diminished.

In the department of pure mathematics Dr. Young contributed a paper containing a demonstration of a rule for the quadrature of simple curves by infinite series, and one on the extraction of roots in general: this is printed in the first volume of the 'Transactions;' and in the same volume there is a paper by him containing a collection of ancient Gaelic poems. An interesting paper by Dr. Young on the 'Origin and Theory of the Gothic Arch,' is published in the third volume. In this paper the writer offers an opinion that the Gothic architects were induced to employ pointed arches in their buildings from a knowledge of their mathematical properties: from an investigation of their strength, on scientific principles, he comes to the conclusion that a pointed arch whose radius of curvature is equal to the span, or the distance between the supporting pillars, is the weakest of the kind, and also that the strength increases as the radius of the curve becomes, within certain limits, either less or greater than the span. In comparing low Gothic and circular arches of a semicircular form, he proves that, when the radius of the former is equal to three-fourths of the span, the strength is to that of a semicircular arch of equal span as 1000 to 1257; and when the radius is two-thirds of the span, as 1000 to 1210. In the fourth volume of the 'Transactions' there is a paper by Dr. Young containing demonstrations of Newton's theorems for the correction of the spherical aberration in the object-lenses of telescopes.

Besides these contributions to the Academy, Dr. Young published separately 'An Essay on the Phenomena of Sounds and Musical Strings,' 8vo, 1784. He subsequently published a short essay on the primitive colours in solar light, and one on the procession of the equinoxes. His last work was that which he entitled 'Principles of Natural Philosophy,' 8vo, 1800, and which contains the substance of the lectures which he had delivered at the same society.

YOUNG, PATRICK, Latinised Patricius Junius, the son of Peter Young, was born on his father's estate at Seton in East Lothian, N.B., on the 29th of August 1584. He studied at the University of St. Andrews, where he took the degree of A.M. in 1603. He lived for some time with Dr. Lloyd, bishop of Oxford, by whom his love of study was appreciated and encouraged. It was probably through the influence of Lloyd and other patrons that, in 1605, he was by special favour incorporated in the degree of M.A. at Oxford, without having followed any course of study in England. He took deacon's orders, and was chosen chaplain of New College. He afterwards went to London with the view of trying his fortune at the court of King James, and through the influence of Montague, the bishop of Bath and Wells, he obtained a pension of 50l. a year. He was appointed keeper of the king's library, and occupied himself for some time in classifying and cataloguing the books. In 1617 he went to France and other neighbouring states, partly with the view of making collections for the library. He carried with him recommendations from Camden, and being able to speak several languages, he soon formed an intimate acquaintance with a large circle of learned men. His biographer Smith has collected such incidental notices of his person, or of his works, as are afforded by contemporary continental writers, and the collection shows his circle of admirers to have been both extensive and illustrious. From a very early age it had been his ambition to be a master of Greek, and he entered on a considerable portion of his correspondence with his learned contemporaries in that tongue. His enthusiastic admiration of ancient Greece extended itself to the modern inhabitants of that country, among whom he seems to have been anxious to resuscitate a knowlege of the literature of their ancestors. He made the personal acquaintance of several Greeks, whom he invited to England, supporting them there by his own funds, and the subscriptions of friends who sympathised in his views. It does not appear that more than one of these ever fulfilled by his subsequent exertions for the preservation of his countryman, the views of his enlightened patron. Young has not left behind him many literary memorials of his high reputation for scholarship. He appears to have been an indolent man, and not anxious for literary fame. Seldon dedicates to him the 'Marmora Arundelians' in very flattering terms, describing himself, in drawing up that work, as doing little more than collect and arrange the elucidatioces which Young had the merit of suggesting. He assisted his countryman Thomas Reid in translating into Latin the works of King James. On the arrival in 1628 of the Alexandrine Manuscript of the Bible in the royal library of which he had charge, he commenced a critical examination of its contents, with the view of publishing an edition of the whole contents of the manuscript. Of his exertions however in pursuance of this project he left behind him only a few vestiges. Among these there is a collection of notes down to the fifteenth chapter of Numbers, which are published in the sixth volume of Walton's Polyglot Bible, under the title 'Patricii Junii Annotationes quas paravarat ad MS. Alexandrini Editionem, in quibus Codicem illum antiquissimum cum Textu Hebraico et veteribus Ecclesiæ Scriptoribus, eliisque Græcis Editionibus confert.' He published, in 1633, an edition of the Epistles of Clemens Romanus, from the same manuscript, which will be found in the first volume of the 'Sacrosancta Concilia' of Labbeus and Cossart. In 1638 he published and dedicated to Bishop Juxon an 'Exposition of Solomon's Song,' written by Gilbert Foliot, bishop of London, in the time of Henry II. It is said that he was in the course of applying the treasures of the royal library to several other literary undertakings, when the supremacy of the parliamentary party deprived him of his appointment in that institution. In 1649 he retired to Bromfield in Essex, where he lived with his son-in-law Mr. Atwood. He died on the 7th of September 1652, according to a monumental inscription preserved in Bromfield church. (Smithius, *Vitæ quorundam eruditissimorum et illustrium Virorum: Biographia Britannica.*)

YOUNG, SIR PETER, Latinised Petrus Junius, is said to have been born in Forfarshire in Scotland, on the 15th of August 1544. He studied at Geneva and Lausanne, and became intimate with Beza, to whom his uncle Henry Scrimgeur made him known. Returning home in 1569, he was appointed co-tutor, along with Buchanan, of the young prince of Scotland, afterwards James I. of England. When the prince took the administration of the government, Young became a member of the privy council. In 1586 he was sent as ambassador to Frederic II. of Denmark, to conduct the negociations as to the possession of the Orkney Isles. He afterwards attended James on his romantic journey to Denmark to bring home his queen, and was employed on various missions to that and the neighbouring states. He ranks among the vindicators of Queen Mary. He prepared a short narrative of that queen's life and death, with the view of meeting some opinions expressed against her by David Chytræus. This little work is incorporated with his Life by Smith. He settled in England, where he was knighted in 1614, and received a pension of 300*l*. In 1620 he retired to an estate which he possessed in Scotland, where he died on the 7th of January 1628. (Smithius, *Vitæ quorundam Eruditissimorum et Illustrium Virorum.*)

YOUNG, THOMAS, M.D., was born June 13, 1773, at Milverton, in Somersetshire. He was the eldest of ten children of Thomas and Sarah Young, who were both Quakers. In 1780 he was placed at a boarding-school at Stapleton, near Bristol, and in 1782 was sent to the school of Mr. Thompson, at Compton in Dorsetshire, where he remained nearly four years. During this period he studied, besides Latin and Greek, the French, Italian, and Hebrew languages. After his return home he devoted himself almost entirely to the study of Hebrew, and to the practice of bookbinding, which trade he had been taught by an usher of Compton school. In 1787 he accepted, in conjunction with Mr. Hodgkin, an engagement as private tutor to Hudson Gurney, grandson of Mr. David Barclay, of Youngsbury, near Ware, in Hertfordshire. There he remained till 1792, employing his leisure hours to the acquisition of Arabic, Persic, Latin, and modern languages, Oriental as well as European, and also to mathematics, algebra, fluxions, natural philosophy, and the 'Principia' and 'Optics' of Newton. Mr. Hodgkin in 1793 published 'Calligraphia Græca,' which he dedicated to Young, who had suggested the work, and furnished the writing.

In the autumn of 1792 Thomas Young removed to London, in order to study medicine by the advice and on the invitation of Dr. Brocklesby, an eminent physician, who was his maternal uncle. Young was by him introduced to Mr. Burke, Sir Joshua Reynolds, and other distinguished men; and he attended the lectures of Drs. Baillie, Cruikshank, and John Hunter. In the autumn of 1793 he entered himself a pupil at St. Bartholomew's Hospital, and in October 1794 proceeded to Edinburgh, still further to prosecute his medical studies. Before quitting London for Edinburgh, he had resolved to give up some of the external characteristics of the Quakers; but the change of habits and associations in a short time led to a total and permanent separation from them. He mixed largely in society, began the study of music and took lessons on the flute, and also private lessons in dancing, and frequently attended performances at the theatre. In the summer of 1795 he made a tour in the Highlands of Scotland.

In October 1795 he left London, in order to make a tour on the continent. He took a doctor's degree at the university of Göttingen, and prosecuted his studies there during nine months. In May 1796 he made a tour to the Harz Mountains, ascended the Brocken, and descended some of the deepest mines. After leaving Göttingen, he visited Gotha, Erfurt, Weimar, Jena, Leipzig, Dresden, and Berlin, and returned to England in February 1797.

Almost immediately after his return Thomas Young was admitted a Fellow Commoner of Emmanuel College, Cambridge. Dr. Brocklesby died December 13, 1797. He had fostered the promising talents of his nephew, had provided for the completion of his general and professional education, and now left him by will about 16,000*l.*, and his house in London, with furniture, library, and a choice collection of pictures, mostly selected by Sir Joshua Reynolds. After this, Young resided sometimes at Cambridge, and sometimes at Bath, Worthing, and elsewhere.

Digitized by Google

Having, in 1799, completed his last term of residence at Cambridge, in 1800 he settled in London, and commenced the profession of medicine. His practice however was never large, so that he was enabled to devote much of his time to his favourite literary and scientific pursuits. Several years were then required to elapse between the date of admission of a student at Cambridge and the granting of his degrees in medicine, so that Young did not obtain his degree of M.B. till 1803, nor that of M.D. till 1807. As early as 1799 he had written his memoir, 'Outlines and Experiments respecting Sound and Light,' which was read before the Royal Society, and printed in their 'Transactions.' Other papers 'On the Theory of Light and Colours' followed, which the Council of the Royal Society selected for the Bakerian lectures.

In 1801 he accepted the office of Professor of Natural Philosophy at the Royal Institution, which had been established the year preceding. His first lecture was delivered January 20, 1802. He lectures were not popular. His matter was too much compressed and his style too laconic. In 1802 he was appointed Foreign Secretary to the Royal Society, an office which he held during the remainder of his life, and for which he was well qualified by his knowledge of the principal languages of Europe. He married June 14, 1804. After fulfilling for two years the duties of Professor of Natural Philosophy to the Royal Institution he resigned the appointment.

During his connection with the Royal Institution he delivered sixty lectures, which form the substance of his great work, which was published in 1807, and entitled 'A Course of Lectures on Natural Philosophy and Mechanical Arts,' 2 vols. 4to. This work includes also his optical and other memoirs, and a classed catalogue of scientific publications. A new edition was published in 1845, 'with References and Notes, by the Rev. P. Kelland, M.A., F.R.S., &c., illustrated by numerous Engravings on Copper,' 8vo. These lectures embody a complete system of natural and mechanical philosophy, drawn from original sources; and are distinguished not only by extent of learning and accuracy of statement, but by the beauty and originality of the theoretical principles. One of these is the principle of interferences in the undulatory theory of light. "This discovery alone," says Sir John Herschel, "would have sufficed to have placed its author in the highest rank of scientific immortality, even were his other almost innumerable claims to such a distinction disregarded." The first reception however of Dr. Young's investigations on light was very unfavourable. The novel theory of undulation especially was attacked in the 'Edinburgh Review,' and Dr. Young wrote a pamphlet in reply, of which only one copy was sold. He communicated frequently with the French philosopher Fresnel, who entertained views similar to his own on the nature of light. The undulatory theory is now generally received in place of the molecular or emanatory theory. Among the other difficult matters of investigation in which Dr. Young was engaged was that of the Egyptian hieroglyphics, in which in fact he preceded Champollion. [CHAMPOLLION, J. F.]

In 1809 and 1810 Dr. Young delivered at the Middlesex Hospital a series of lectures on the elements of medical science and practice. In January 1811 he was elected one of the physicians of St. George's Hospital, a situation which he retained for the remainder of his life. His practice there, as elsewhere, is stated to have been extensive and successful, but he never became popular. In 1813 he published 'An Introduction to Medical Literature, including a System of Practical Nosology, intended as a Guide to Students and an Assistant to Practitioners,' 8vo. In 1816 Dr. Young was appointed secretary to a commission for ascertaining the length of the seconds pendulum, and for comparing the French and English standards with each other, and for establishing in the British empire a more uniform system of weights and measures. He drew up the three reports, 1819, 1820, 1821. In 1818 Dr. Young was appointed secretary to the Board of Longitude, and on the dissolution of that body he became sole conductor of the 'Nautical Almanac.'

Dr. Young at various times contributed eighteen articles to the 'Quarterly Review,' of which nine were on scientific subjects—the rest on medicine, languages, and Articiem. Between 1816 and 1823 he wrote 63 articles for the 'Supplement to the Encyclopædia Britannica,' of which 46 were biographical. In 1821 he made a short tour in Italy in company with his wife. In August 1827 he was elected one of the eight foreign associates of the Academy of Sciences at Paris, in place of Volta, who died in 1826. Dr. Young died May 10, 1829, and was buried in the vault of his wife's family at Farnborough, Kent.

In 1855 was published a 'Life of Thomas Young, M.D., F.R.S., &c., by George Peacock, D.D., F.R.S., &c., Dean of Ely,' 8vo. In the same year was published 'Miscellaneous Works of the late Thomas Young, M.D., F.R.S.,' &c.: vols. i. and ii. including his Scientific Memoirs, &c., edited by George Peacock, D.D., F.R.S., &c., dean of Ely, 8vo, 1855; vol. iii., Hieroglyphical Essays and Correspondence, &c., edited by John Leitch. These volumes contain all Dr. Young's contributions to the 'Transactions' of the Royal Society; the principal articles furnished for the 'Supplement to the Encyclopædia Britannica;' many essays from Nicholson's 'Journal' and Brande's 'Journal;' some reviews on scientific subjects from the 'Quarterly Review;' and several essays either separately published or dispersed in different publications.

YRIARTE, JUAN DE, was born at Orotava, in the island of Teneriffe, on the 15th of December 1702. His father was a native of Navarre, and held a commission in the troops stationed in the Canaries. His mother was a native of Orotava. Juan was the first-born of a family of five sons and three daughters.

When Juan had barely completed his eleventh year, his father, who entertained a high opinion of French seminaries, sent him to France, under the charge of Pedro de Help, French consul in the Canaries, who was returning to his native country. He sailed from Orotava on the 18th of December 1713, and did not return to the Canaries till 1724. The year 1714 was spent in attendance at the public schools of Paris; in April 1715 Help transferred his residence to Rouen, whither his ward accompanied him. At what time Yriarte quitted Paris does not clearly appear; but he spent eight years in the college of Louis le Grand, where he distinguished himself by his acquirements in the classical languages and in the mathematics. Before returning to Teneriffe he visited London, apparently with a view to make himself master of the English language. His stay there was short: the intelligence of his father's declining health precipitated his departure.

On his arrival at Orotava, some time in 1724, he found his father already dead. It had been his wish that Juan should proceed from the Canaries to Spain, and study law in some of the Spanish universities. The young man remained some months at Orotava, seemingly irresolute to follow out the career designed for him by his father, and during this time he was busy extending the knowledge of the English language acquired during his short residence in London. At last he resolved to comply with the wishes of his deceased parent, and sailed for Spain about the end of 1724.

The reputation of the royal library induced him to visit Madrid, and the facilities afforded him by that institution for indulging his passion for reading detained him longer in that capital than he intended. The frequency of his visits and the class of works in use attracted the notice of the principal librarian, Don Juan de Ferrara, and of the king's confessor, Father Guillermo Clarke, who was director of the royal printing-office. The terms in which these officials spoke of the acquirements of the young stranger induced the Duke de Bejar to engage Yriarte as tutor for his son. Yriarte succeeded so well in this charge that he was successively engaged to give lessons to the son of the Duke of Alba and to the Infante Don Manuel of Portugal, who visited Madrid about that time. His leisure hours were spent in the royal library, in which his first access at length procured him an appointment. On the 19th of April 1729, Yriarte was appointed secretary to the royal printing-office; and on the 4th of January 1732 a librarian in the royal library.

His extensive knowledge of languages and his passionate love of books alike well qualified him for filling the latter post. During the thirty-nine years that he continued librarian he added two thousand manuscripts and upwards of ten thousand printed volumes to the collection. In 1729 he had published a catalogue of the geographical and chronological works contained in the library; in 1730, a catalogue of the historical works; in 1769 he published the first volume of a catalogue of the Greek manuscripts in the royal library, illustrated with notes, indices, and anecdotes. A second volume was promised, but never appeared.

The linguistic attainments of the librarian were frequently put in request by the government officers; and so valuable were they found, that on the 21st of February 1740 he was appointed official translator to the principal secretary of state. The secrecy observed in a ministerial cabinet renders it impossible to learn with certainty the exact qualifications he showed himself to be possessed of for this office; but during the whole twenty-nine years that he continued to fill it, he enjoyed a high reputation among Spanish statesmen for method, punctuality, and severe integrity.

The laborious duties of the librarian and official translator did not occupy the whole time of Yriarte. In 1743 he was elected a member of the Royal Academy, and continued till his death to take an active part in its labours. The chief labour of devising an improved system of orthography, punctuation, and accentuation for the Spanish language fell upon Yriarte: he was ordered by the king to compile a Spanish-Latin Dictionary, in which however he proceeded no further than the letter A; and he published a Latin grammar in Castilian verse. He had also a hand in revising and improving the 'Hispania Nova' of Nicolas Antonio, and the 'Bibliotca Arabico-Hispana Escurialense' of Casiri, and was of material assistance to Abreu in his 'Coleccion de Tratados de Paz d'España.'

Yriarte composed elegantly in verse, both in Spanish and Latin. A collection of Spanish proverbs rendered into Latin verse, of epigrams in Latin, of translations from Martial, and of occasional verses both in Latin and Spanish, was published by subscription after his death. Juan Yriarte died at Madrid on the 23rd of August 1771, in the sixty-ninth year of his age. In addition to the works already mentioned, he left in manuscript 'Historia de las Islas de Canaria,' and 'Paleografia Griega.' He also contributed largely to the 'Diario de los Literatos de España.'

Three brothers of the name of Yriarte, nephews of Don Juan, have distinguished themselves in the public service, and in the literature of their country, but the materials for their biography are very scanty. They appear to have been all born in Teneriffe; it is probable therefore that their parents were settled there, and that the prosperous fortunes

Digitized by Google

of Juan de Yriarte induced his nephews to try their fortunes in the mother-country.

BERNARDO YRIARTE, the eldest, appears to have been born about 1734. He rose to be a member of the Council of State, and of the Council of the Indies, and was created a knight of the order of Charles III. He was a member of the Royal Academy of St. Ferdinand, and nominated its patron by Charles IV. in March 1792. When the French took possession of Spain in 1808, Bernardo Yriarte was appointed a councillor of state by Joseph Bonaparte. On the return of Ferdinand VII., Yriarte fled to France, and died at Bordeaux on the 11th of July 1814.

DOMINGO YRIARTE, the second brother, was born in 1746, and entered the diplomatic service at an early age. After a prolonged residence, first at Vienna, and then at Paris, as secretary to the embassy and chargé d'affaires, he was sent as minister plenipotentiary to the king and republic of Poland. On the 22nd of July 1795 he signed, along with Barthélemy, the peace concluded at Bâle between the king of Spain and the French republic. Returning thence to Spain in bad health, he died at Gijon on the 22nd of November of the same year, just after he had been appointed ambassador to France.

TOMAS YRIARTE, the youngest, but most distinguished of the brothers, was born about 1750. Under the direction of his uncle Juan he made rapid progress in the ancient and modern languages, and was appointed chief archivist in the office of the principal secretary of state. This appointment left him ample leisure for literary pursuits, and the approbation which his first essays met with procured for him the editorship of the 'Madrid Mercury.' This journal, which, was previously little more than a translation of the 'Hague Gazette,' became in his hands a useful and amusing publication.

In 1769 a new theatre was opened in Madrid; and in the course of that and the three succeeding years a number of translations from the French drama by Yriarte were performed on its boards with considerable success. In 1778 an original comedy by Yriarte, 'El Señorito mimado' (The Spoiled Child), was favorably received by the Madrid public. In 1779 a poem in five books, entitled 'La Musica,' appeared from the pen of Yriarte: it is upon this work and his fables that his reputation is most likely to rest. 'La Musica' has run through five editions, and has been translated into most European languages. In 1781 he was a competitor for the prize awarded to the best idyl by the Spanish Academy, but the poem of Juan Melendez Valdez was preferred. Yriarte vented his spleen in a severe criticism of his rival's work in the 'Mercury.' 'Fabulas Literarias' was published in 1782. Of these fables Bouterweck remarks that their style is pure, and their versification elegant, and that they are characterised by a graceful naiveté that reminds the reader of Fontaine, but without conveying any suspicion of imitation. In addition to these works Yriarte published epistles in verse, sonnets, critical miscellanies, a translation in verse of the first four books of the 'Æneid,' and of Horace's 'Art of Poetry.' He published a collection of his works in 1782, and an enlarged edition in 1787. His taste for French literature, or some other cause, occasioned suspicions of his orthodoxy: in 1786 he was subjected to an examination by the Inquisition, and his replies were so little satisfactory that he was laid under a quasi arrest—confined within the walls of the city. Ultimately he was allowed to do penance privately, and was absolved. He did not long survive: he was attacked by epilepsy, and died of an inflammatory attack in 1790 or 1791.

A painter of the name of Yriarte, who was born in Biscay in 1635, and who died at Seville in 1685, was considered the best landscapepainter of his age.

FRANCISCO DIEGO DE AINSAY YRIARTE, a native of Huesca, published in 1612, 'Translacion de las Reliquias de San Orencio, Obispo de Aux;' and in 1619, 'Fundacion, Excelencias, Grandezas, &c., de la estiquisima Ciudad de Huesca.' Antonio mentions that he was master of the grammar school of Huesca, and died young, but without mentioning the year of his death.

(*Noticia de la Vida y Literatura de Don Juan de Yriarte*, prefixed to the collection of his works published at Madrid in 1774; *the Prefaces to the Collected Works of* Tomas de Yriarte, published at Madrid in 1787; Antonio, *Bibliotheca de Hispania Nova*; *Biographie Universelle*, Pignatelli published a eulogistic Narrative, and Joly e Notice of the Life of Tomas de Yriarte, in the *Repertoire de Littérature*, neither of which we have seen.)

Z

ZACH, FRANCIS XAVIER, BARON VON, an eminent astronomer, director of the Dnal Observatory at Seeberg, was born at Peath in Hungary, on the 14th of June 1754. He was a member of a noble and distinguished family, and was encouraged from his childhood in an ardent pursuit after knowledge, which, aided by a strong constitution and great mental powers, led to the eminence he afterwards attained. The striking phenomenon of the transit of Venus over the disc of the sun in 1769—a memorable event, which made more than one important convert to the science of astronomy—together with the appearance of a comet in the same year, directed his attention towards that science and the branches of knowledge most connected with it. Having completed his education, he was anxious to visit the various seats of learning and science in other countries, and, after travelling with this view on the continent of Europe, he arrived in England, and was received in a flattering manner by George O'Brien Wyndham, third Earl of Egremont, and other distinguished persons. He continued to reside here for several years, and it was thus that he became critically acquainted with the language, literature, and state of science in this country. He also acquired for our manners and institutions an attachment which continued throughout his life.

After his return to Germany, a permanent employment being desirable, Von Zach prevailed on the reigning Duke of Saxe-Gotha to erect a substantial observatory for him in 1786 at Seeberg, where a series of observations, a Catalogue of 381 Stars, a Catalogue of 1830 Zodiacal Stars, his Solar Tables,—and those on Nutation and Aberration, to which we shall return,—evinced an indefatigable observer and able computor, and placed his name in the first rank of German astronomers. He became secretary to an association of them for the purpose of searching for a planet between Mars and Jupiter, which his own hypothetical computations had mainly led them to form. When the new planet Ceres was lost sight of (after its first discovery, quite in accordance with his views, though not by a member of the association) he was so persuaded of its planetary rather than cometary nature, that he persisted in searching for it, till his endeavours were crowned with success, and he thereby laid the foundation for detecting the three other small planets which were added to the system in the early part of the century. This was accomplished while he was also completing a map of Thuringia, from an actual survey, for the King of Prussia. These labours however had not altogether absorbed his active mind. Struck with the advantages of a correspondence which might in some degree unite the astronomers and mathematicians of all countries, he determined, in 1793, to edit an Ephemeris at Weimar, which in a couple of years ripened into the well-known periodical work entitled 'Monatliche Correspondenz.' This valuable journal contained records of the progress of astronomy, derived from the extensive and laborious correspondence of the editor with the principal astronomers of Europe, which he continued to maintain throughout his long life, and contributed more than any other publication to the great impulse given for many years to the cultivation of astronomical science in Germany.

In the early part of the present century, before astronomers had devised any general method having for its object to facilitate the reduction of observations of the heavenly bodies, by combining together in one homogeneous system of calculation, as far as was practicable, the separate processes for determining the various inequalities which affect their apparent positions, Von Zach took a useful and honourable part in the production of tables designed to abbreviate the toilsome calculations attendant on this operation of reduction. In 1807 he produced tables to facilitate the computation of aberration and nutation for Ceres. They were attached to a catalogue of 1830 zodiacal stars; but their application was confined to 491 of the principal stars in the catalogue. This number however was equal to that in the only two sets of tables for the purpose that were or had been produced by other astronomers, those of the French in the 'Connoissance des Temps,' and those of Cagnoli, published at Modena simultaneously with his own. In 1812 Von Zach gave an important extension to his previous labours by the publication of similar tables adapted to a catalogue of 1440 stars. But his tables were not distinguished from those of his predecessors and contemporaries by supplying the omission, common to them all, of the solar nutation—a defect which it was reserved for the refinement of a subsequent period to remedy.

In the year 1813 he removed to the south of France, and subsequently accompanied the Duchess of Saxe-Gotha into Italy, where he made numerous celestial observations, and settled for some years in a delightful villa in the eastern subnrb of Genoa. Here his first care was to raise a small observatory, and to re-commence publishing his 'Correspondence,' which had been intermitted. In order that it might be still more widely available than before, he now printed it in the French language, and gave considerable extension to its objects. In its new form it embraced astronomy, geodesy and geography, hydrography, and statistics; and although conducted with the lively discursive freedom characteristic of Von Zach, the discussions it includes lead to many points of the most abstruse and transcendental inquiry; and, the editor being fully aware himself of the necessity of explicit detail on such subjects, it had the merit of submitting the whole type of mathematical analysis in every case of its application, instead of abruptly giving mere conclusions—the fault of so many scientific journals. The astronomical and geodetical desiderata of seamen and surveyors were also from time to time carefully provided.

In 1814 Baron Von Zach published his 'Attraction des Montagnes,'

Digitized by Google

in which he endeavoured to determine the effects of attraction on the plumb-line by means of a series of astronomical and geodetical operations, which he had carried on at Marseille in the preceding year.

In 1826 he unexpectedly removed from Genoa, and astronomy suffered a general loss by the cessation of his work. For many of the later years of his life he suffered severely from the stone, and at length the constant care of Dr. Civiale of Paris became so absolutely necessary that he took up his abode in that city in order to receive it. Experiencing relief by the operation of lithotrity, he enjoyed short intervals of comparative ease that he even entertained thoughts of re-visiting England, when he was suddenly attacked by cholera on its first modern visitation of Europe, and died on the 2nd of September 1832, after an illness of only twenty hours. He was a man of warm and ardent affections, of the most lively and agreeable conversation, rapid, and sometimes hasty in his conclusions, but of indefatigable industry. There have been few persons of the present century whose loss has been more sensibly felt by the friends of astronomy in every country in Europe.

Baron Von Zach was a member of most of the scientific societies in Europe, a counsellor of state and chamberlain of the court of Saxe-Gotha, where he had the military rank of colonel, and was a knight of the royal order of the Black Eagle of Prussia. He had been elected a foreign member of the Royal Society of London on the 12th of April 1810, at the same time with Gauss, Olbers, and Piazzi. His only contribution to the 'Philosophical Transactions' consisted of 'Astronomical Observations, in Two Letters,' addressed to Tiberius Cavallo, F.R.S. These are dated Lyons, April 4 and May 4, 1788, but were not read before the society until December 23 in the following year, and were printed in the volume for 1785. This is noted because certain irregularities formerly practised, or errors committed in the reading, dating, and publication of papers by the Royal Society, have led to serious difficulties in unravelling the history of discoveries—of the discovery of the compositions of water for example. The delay in the present instance is probably referable simply to the tardy communication of Cavallo.

Von Zach's name appears in the first list of the (Royal) Astronomical Society, dated February 8, 1822, as an associate, or foreign member. To the 'Memoirs' of the society he communicated the following papers:—'Remarks on Captain David Thomson's Method and Tables for working a Lunar Observation made at Sea,' vol. iv.; 'A New Method of Reducing the apparent distance of the Moon from a Star to the true distance,' to which is annexed a Demonstration of the process, by A. De Morgan, Sec. R.A.S., vol. v.; 'On the Geographical Latitude and Longitude of a place on the Terrestrial Spheroid, the Geodetic distances of which from the meridian and perpendicular of a given point are known,' vol. vi.: the method which the author reproduced, with some modifications, in this paper, had been originally published by him in his 'Correspondence' in the year 1815. Not long afterwards, formulæ for the solution of the same problem, practically identical with his own, were devised by Oriani of Milan, whose method was afterwards employed by Captain Kater in his determination of the difference of longitude between the observatories of Paris and Greenwich, in preference to any other, as the most commodious and expeditious. On this account, Von Zach, as the particular formulæ he had constructed had not been noticed, thus communicated them to the society shortly before his decease.

ZACHARIÄ, JUST FRIEDRICH WILHELM, a German poet, was born on the 1st of May 1726, at Frankenhausen in Thuringia, where his father was employed in the service of the Prince of Schwarzburg. After the completion of his preparatory education, he went, in 1743, to the University of Leipzig, professedly to study the law; but he devoted himself almost exclusively to belles lettres, an inclination which had been cherished by his father, who had himself some name as a poet in his native place. Zacharias's first attempt at poetical composition created considerable sensation at Leipzig, and attracted the attention of Gottsched, then the critical oracle in matters of taste in Northern Germany, who induced the young poet, in 1744, to publish his comic epic 'Der Renommist' (The Brawler) in the 'Belustigungen die Witze und Verstandes,' a periodical edited by Gottsched himself. This poem was the first of its kind in German literature. The author had taken Pope's 'Rape of the Lock' for his model, but his imitation was not a very successful one. Zacharias, like all young men who had power and originality, soon emancipated himself from this pedantic tyranny of Gottsched, and in 1744 he joined the society of young men then assembled at Leipzig, who prepared a better taste in German literature by insisting upon the necessity of studying the ancient Greeks and Romans, the early German poets, and especially the literature of England. The great success which the 'Renommist' had met with induced Zacharias successively to publish a series of comic epics, among which we may mention 'Phaeton,' 'Das Schnupftuch,' 'Murner in der Holle,' the last two of which are the best among them. In 1747 he went to Göttingen, where he formed connections with men of congenial minds. In the following year he was appointed teacher at the gymnasium (Carolinum) of Brunswick, and the beneficial influence which he exercised there on the development of the talents and tastes of his pupils induced the Duke of Brunswick, in 1761, to appoint him professor of poetry at the Carolinum. In addition to this office he was appointed, in 1762, to the superintendence of the printing and publishing establishments connected with the orphan asylum (Waisenhaus) of Brunswick, and of the Brunswick 'Intelligenzblatt,' to which he himself contributed a series of interesting and useful papers. In 1764 he resigned the superintendence of those establishments, which had prospered very much under his management, and confined himself to the duties of his professorship. From 1768 to 1774 he edited the 'Neue Braunschweiger Zeitung' (the New Brunswick Gazette), for which he himself wrote nearly all the literary articles, and all the reviews. He died on the 30th of August 1777.

Zacharias was one of the best poets of his time, and in the comic epic he has scarcely been surpassed by any more recent German poet. He is less successful in descriptive poetry. He also wrote a number of songs in a light and pleasing style, and he himself set many of them to music. He made a German translation of Milton's 'Paradise Lost,' in hexameter verse (4to, Altona, 1760; a second and improved edition appeared in 1762), but the translation is weak, and not always faithful to the original. His 'Fabeln und Erzählungen in Burkard Waldis' Manier' belong to his best poetical productions. His style is clear, plain, and correct. For the purpose of promoting the study of the early German poets, Zacharias began to publish a collection of the best specimens of the best German poets from the time of Opitz ('Auserlesene Stücke der besten Deutschen Dichter von Opitz bis auf gegenwärtige Zeiten,' 2 vols. 8vo, 1766-71). This undertaking was continued after Zacharias's death, by Eschenburg, who published a third volume (1778, 8vo). The first complete collection of Zacharias's works appeared, in 9 vols. 8vo, at Brunswick, in 1763-65. A second and obenser edition, in which the translations from foreign languages are omitted, was published in 1772, in 4 vols. 8vo, and was reprinted in 1777. After his death, Eschenburg published a supplementary volume, which also contains a Life of Zacharias.

ZACHARIÄ, KARL SALOMON, a celebrated German jurist and political writer, was born at Meissen, on the 14th of September 1769, and received his early education in the royal public school (Fürstenschule) of his native place. In 1787 he went to the university of Leipsig, where at first he devoted himself almost exclusively to philological and philosophical studies, but afterwards he took up the study of jurisprudence. He left Leipsig in the spring of 1792, and, being recommended by persons of high distinction, obtained the situation of tutor to the young count Znr Lippe, whom he accompanied to the university of Wittenberg, where he continued his studies for two years longer. When the count entered upon his military career, Zacharise, in 1795, carried into effect his favourite plan of becoming an academical teacher. He had been appointed professor extraordinary two years before he was appointed professor extraordinary, and in 1802 he was raised to the ordinary professorship of jurisprudence in the University of Wittenberg. He had distinguished himself as an author long before this time, and had acquired considerable reputation as a philosophical and political writer. In 1807 he received an invitation to a professorship in the University of Heidelberg, which he accepted because in his situation at Wittenberg his leisure time was almost wholly occupied with the practical administration of justice, which formed no part of his official duties, and little time was left for literary pursuits. At Heidelberg, he lectured on law in all its departments, among which we may mention the public law of Germany, canon law, feudal law, and comparative jurisprudence. He always treated his subject in a philosophical spirit. His merits were rewarded by the title of Geheimer Rath of the grand-duchy of Baden, and by other distinctions. For a time he was drawn away from his scientific and literary pursuits by being elected a member of the first and afterwards of the second chamber of the grand-duchy of Baden. In the capacity of deputy he has been charged with being an advocate of monarchy, and it has been said that the deputies were too much in the hands of the government than it ought to have, but as far as his writings show, from which alone we are enabled to judge of him, he was a liberal royalist, with a strong leaning towards aristocratic principles. During his active career in the university of Heidelberg, he received two very honourable invitations, the one to Göttingen and the other to Leipsig, both of which he declined. He remained at Heidelberg until his death on the 27th of March 1843, having shortly before been raised to the rank of nobility under the name of Baron Zachariæ von Lingenthal. Zacharise was one of the ablest and most philosophical writers on law and politics in Germany, and few continental men have possessed a more comprehensive knowledge of the legal and political institutions of the various states of modern Europe than he did.

The following list contains his principal works:—1, 'Handbuch des Künftighleben Lehnrechts,' 8vo, Leipsig, 1796; a second edition was published by Ch. E. Weisse and F. A. Langenn, 8vo, Leipsig, 1823. 2, 'Die Einheit des Staats und der Kirche,' 8vo, Leipsig, 1797; a sort of appendix to this work is his 'Nachtrag über die evangelische Brüdergemeine,' 8vo, Leipsig, 1798. 3, 'Handbuch des Französischen Civilrechts,' of which the third edition appeared in 4 vols. 8vo, at Heidelberg, 1827, &c. 4, 'Vierzig Bücher vom Staate,' 5 vols. 8vo, Stuttgardt, 1820-32: a new and much enlarged edition of this work was begun in 1839, and completed in 1843, in 7 vols. 8vo; it is by far the best work on political philosophy in the German language. 5, 'Lucius Cornelius Sulla, als Ordner des Römischen Freistaates,' in two parts, 8vo, Heidelberg, 1834, is a very admirable treatise, the only fault of which perhaps is, that he assigns greater merits to the political reforms of

Digitized by Google

Sulla than they deserve. He also contributed many valuable papers to the periodical which he edited conjointly with Mittermaier, entitled 'Kritische Zeitschrift für Rechtswissenschaft und Gesetzgebung des Auslandes,' and to the 'Heidelberger Jahrbücher.'

ZACHARIAH, son of Jeroboam II., was king of Israel: in 2 Kings xiv., he is said to have succeeded his father, in the 16th year of the reign of Uzziah, king of Judah, B.C. 793. Historians have generally interposed an interregnum, Hales and his followers of twenty-two years (B.C. 793 to 771), Blair and Jahn for eleven and twelve years. This is not recorded in the Holy Scriptures; but in 2 Kings xv. it is said that in the 38th year of Uzziah (B.C. 771), Zachariah reigned "over Israel in Samaria for six months." But Jeroboam began to reign in the 15th of Amaziah, who reigned twenty-nine years, that is, till the 14th of Jeroboam; if there was an interregnum on account of Uzziah's youth till the 27th of Jeroboam II., when according to 2 Kings xv. 1, Uzziah began to reign, it must have been of thirteen years, and not of eleven as stated by Blair. Uzziah is recorded to have reigned fifty-two years, and in his 38th year Zachariah "reigned six months," which would leave an interregnum of twenty-four years. Uzziah however, like Zachariah, is stated to have succeeded his father, and no mention is made of any interregnum beyond what is derived from the statement as to the reign of the contemporary king. There is little doubt however that the land was in a revolutionary state. Hosea, who prophesied during the whole of this period says, "for the children of Israel shall abide many days without a king, and without a prince." Zachariah may have been young at his father's death, or his authority may have been contested; but all that is positively stated in 2 Kings xv., is that, like his fathers, he also did that which "was evil in the sight of the Lord;" consequently, his government had no effect in restraining the corruption of the kingdom. In B.C. 771 Shallum conspired against him, and slew him. Neither tradition nor history has handed anything down to us concerning his acts. He was the fourth and last of the race of Jehu, and thus was fulfilled the prophecy of Elijah.

ZACHARIAS. [ZECHARIAH.]

ZACHARIAS, a native of Greece, succeeded Gregory III. in the see of Rome, A.D. 741. Liutprand, king of the Longobards, was then at open hostility with the Holy See, in consequence of his support which the Romans and Pope Gregory had given to Trasmund, duke of Spoletum, and Gotteschalk, duke of Beneventum, who had revolted against Liutprand. Zacharias took a different course of policy: he used his influence with the patrician Stephen, who was duke of Rome, and with the leading men of that city, to induce them to give up the alliance of the rebellious dukes, and he sent messengers to Liutprand to sue for peace, which Liutprand willingly granted. The Romans then joined their militia with the troops of Liutprand, who invaded the duchy of Spoletum, and obliged Trasmund to surrender to the king, who ordered him to take charge of Gallese and appointed Anaprand in his place. Zacharias, in his letters to King Liutprand, urged him to restore several towns or villages belonging to the duchy of Rome, which the king had seized during the former hostilities, and as Liutprand obeyed his requisitions, Zacharias visited him at Terni, when the king received him with great honours, and not only restored the towns in question to the duchy of Rome, but gave to the Roman see a patrimonium or estate in the Sabinum, and other estates in the districts of Ancona, Osimo, Numana, and other parts. The peace between the Longobards and Rome was confirmed for twenty years, and Liutprand restored all the Roman prisoners without ransom.

In the following year, 742, Liutprand attacked the exarch of Ravenna with a powerful force. The exarch, unable to make head against him, applied to the pope for his mediation. Zacharias proceeded to Ravenna, from whence he wrote to Liutprand, announcing to him his intention to visit him in his own capital, Pavia. This was a novelty in the relations between the popes and the kings of the Longobards, and the ministers of Liutprand endeavoured to prevent the being carried into effect. Zacharias however proceeded to Pavia, where he was received by Liutprand with great respect, and, after some debate, the king yielded to the request of the pontiff, and restored to the Greek empire certain territories which he had seized from the exarch. The pope then returned to Rome, being honourably escorted, by order of Liutprand, as far as the Po. In the following year Liutprand died, and was succeeded by his nephew Hildebrand, who, being deposed after a few months for his ill conduct, Ratchis, duke of Friuli, was proclaimed king in 744. Ratchis confirmed the treaty of peace with the duchy of Rome and with the exarch, but in 749, for some cause which is not stated, he laid siege to the city of Perugia, and threatened the other possessions of the Eastern emperor in the Pentapolis. Zacharias, who was anxious for the peace of Italy, hastened to the king's camp, and succeeded not only in making him desist from his attack, but, by his exhortations and remonstrances about the vanity of earthly greatness, he made such an impression on the mind of Ratchis, that the king soon after abdicated the crown, and repaired to Rome with his wife and daughter, where, at their own request, they received the monastic habit from the hands of the pope. Ratchis retired to Monte Cassino, and his wife and daughter founded a nunnery in the neighbourhood of that convent. About the same time Carloman, duke of Austrasia, and second son of Charles Martel, renounced his office in favour of his brother Pepin, proceeded to Rome, where he became a monk, and founded a convent on Mount Soracte.

Pope Zacharias, being informed that the Venetian traders used to purchase Christian slaves in Italy, and even at Rome, whom they sold to the Saracens in the Levant, forbade that traffic under heavy ecclesiastical censures, and ransomed many of those who had been sold, and restored them to liberty.

About 750, Pepin, who governed France, with the title of Maire of the Palace, in the name of King Childeric III., sent ambassadors to Rome to represent to the pope that Childeric was unfit to reign, and had never been king except in name; that it was desirable for the Frankish nation to have a king capable of managing the affairs of the state; and that the leading men of France wished to proclaim him, Pepin, as their king, if the pope would release them from their oath of allegiance to Childeric. Zacharias is said to have answered that it was meet that he who had already the real power and the government of the state should be king, upon which the Frankish leaders and prelates in a general assembly deposed Childeric, had his head shaved, and obliged him to become a monk in the monastery of Sithiou, known afterwards as the abbey of St. Bertin, in the diocese of St. Omer. Childeric's son Thierry was likewise shut up in the monastery of Fontenelle in Normandy. Pepin was consecrated king of the Franks by Boniface, Archbishop of Mainz, in 751. The assent of Zacharias to these proceedings (though the particulars of it are obscure) to this violent change of dynasty is the only questionable act that we know of this pope, who in other respects appears to have been a lover of peace and justice. Pepin himself felt uneasy in his conscience till he received absolution from Stephen II., the successor of Zacharias, and was crowned again by him at Paris. Pope Zacharias died in 752. He is said to have been very generous towards the clergy and the people of Rome; he repaired the Basilica of the Lateran, and built several churches. He translated into Greek the dialogues of Pope Gregory I., or the Great, for the benefit of his countrymen. His epistolary correspondence with Boniface, archbishop of Mainz, is found in Harduin's 'Collection of Councils.'

(Platina e Panvido, *Vite dei Pontefici*; Muratori, *Annali d'Italia*.)

ZACHTLEVEN, CORNELIUS and HERMAN, brothers. Their name is sometimes written Sachtleven. Cornelius was born at Rotterdam in 1600: he excelled in pictures of boors and soldiers, in the style of Teniers and Brouwer. His scenes, which were always sketched from nature, are full of truth and character, but as paintings they want that brilliancy and transparency of colouring which distinguish the works of many of his countrymen. He painted also landscapes, and made many spirited etchings after his own designs. Some of Cornelius's foregrounds are particularly clever, being groups of various utensils or implements, characteristic of the occupations of the characters of the picture. The year of his death is not known, according to the Dutch writers, but in Pilkington's Dictionary 1673 is given.

Herman Zachtleven was an excellent land-cape-painter. He was born at Rotterdam in 1609, and was the pupil of J. Van Goyen; but he lived the greater part of his life at Utrecht, where he died in 1685. Retreat is the favourite theme of this artist generally of views in the vicinity of Utrecht and of the Rhine, are distinguished by great transparency, and in the distances are coloured like those of Wouverman. His earliest pictures are such simple views of nature as the various sites afforded, but in his later works he generally selected various picturesque points, which he composed into one picture; he sometimes introduced many small figures into his works. Herman made many studies from nature in black chalk, which are much valued by collectors: he executed also a few spirited etchings. D'Argenville says that Herman Zachtleven visited Italy, and spent some years there, but Descamps makes no mention of any visit to Italy, and a still greater reason for supposing the statement to be incorrect is that there are no traces of Italy in any of his studies or pictures.

ZAGOSKIN, MIKHAIL NIKOLAEVICH, a Russian dramatist and novelist, was descended from a Tartar family, and was born on the 5th of July (o.s.) 1789, at the village of Banmay, in the government of Penza. He remained in his native village till the age of fourteen, receiving but a slender education, and learning no language but Russian, but was early remarkable for his literary tastes, reading all he could obtain, and composing a tale at the age of eleven. At fourteen he was sent to St. Petersburg as a clerk in a government office, and continued in that kind of employment till the outbreak of the war of 1812, when he became an officer in the St. Petersburg Opolchenie or Militia, took part in the campaign against the French, was wounded at the battle of Polotsk, and before the close of the war rose to be adjutant to General Lewis at the siege of Dantzig. By this time he had acquired some knowledge of French and German, his long dormant literary tastes revived, and not long after he had taken leave of a military life he sent anonymously a comedy, called 'Prokazník' or, 'The Wag,' to Prince Shakhovsky (SHAKHOVSKY), director of the St. Petersburg theatre, who had himself just returned to the duties of management, from the command of a regiment of Cossaks. The reply was so unexpectedly favourable, that Zagoskin at once made himself known, and Shakhovsky even procured for him a post connected with the theatre, and another as an honorary librarian at the Imperial library, where we are told that for his services in assisting to arrange the books and to catalogue the Russian ones, he

Digitized by Google

received the Order of St. Anne of the third class. This was the commencement of his career as a dramatist, which he pursued first at St. Petersburg and after 1820 at Moscow, to which city he was transferred as director of the theatre. He wrote altogether seventeen original comedies, some in verse and some in prose, several of which met with distinguished success, and all, except the last. The best are 'Mr. Bogatonov, or the Country Gentleman in the Metropolis;' 'Bogatonov the Second, or the Metropolitan in the Country;' 'A Romance on the Highroad,' and 'The Journey Abroad.' It is worthy of remark that till beyond the thirtieth year Zagoskin had not written a line of verse, his ear being singularly insensible to cadence and metre, and that in 1821, on some of his friends laughing at him for pretending to give his opinion on poetry when he laboured under this deficiency, he was piqued into saying that he would show he could write verses after all; and setting doggedly to work, and making progress at the rate of four lines a day, correcting the metre on his fingers, he produced some verses that were not only rhythmically correct, but remarkable for their grace and freedom. After this he frequently wrote in verse, but detested the occupation; and when he determined to write a romance in imitation of Walter Scott, one chief inducement was to enjoy a double freedom from the trammels of rhyme and the rules of the drama. The tale he produced, 'Yurii Miloslavsky ili Ruskie v 1612 Godu' (George Miloslavsky, or the Russians in 1612), 3 vols., Moscow, 1829, illustrates the state of Russia at the time that it was nearly conquered by the Poles. The success it met with was prodigious. "The appearance of this romance," says Zagoskin's biographer Aksakov, "made an epoch both in the literary and social career of Zagoskin. The enthusiasm was universal and unanimous; few indeed were there who did not fully share in the public of both the capitals, and after them, or rather with them, the public of all the provincial towns, fell into raptures. Up to this day (in 1852) 'George Miloslavsky' is read by all Russia that can read, and not without cause; the Russian mind and soul, and even the Russian way of speaking, were for the first time represented in Russia in this romance." An English translation of it appeared in London in 1834 under the title of 'The Young Muscovite, or the Poles in Russia, edited by Captain Frederic Chamier, R.N.,' and was said in the preface to be 'edited' from a manuscript translation of the book made into English "by a Russian lady of high rank and her two amiable daughters," to which the editors, for it appears there were more than one, took the liberty of adding "so underplot by which the characters of the chief actors are further developed." Although of course these alterations detract from the value of the book as a picture of Russian life and character, stamped by native approbation as correct, they are not so extensive as to spoil it. Speaking of it from a full perusal of the original, we should say that 'George Miloslavsky' was an amusing third-rate tale, rather unequal in its progress, and falling off both towards the end. Zagoskin was hailed as the Russian Walter Scott. For his next tale 'Rostavlev,' a story of Russia in 1812, in which he introduced some of his own adventures, there was an unheard-of competition in the Russian publishing world, 4800 copies were printed, and an enormous price given for the copyright, but it was by far disappointing the success of its predecessor. Zagoskin went on writing novels and romances, and in general founding a play on each after it appeared; but the merit and popularity of his works went on diminishing, and none of his subsequent productions was considered to rival 'Yurii Miloslavsky,' or even 'Rostavlev.' He continued to reside at Moscow, where he enjoyed the additional appointment of director of the Armoury of the Kremlin, and was a well-known and popular member of the best society, which his never-failing good-humour and disposition to merriment qualified him both to entertain and to enjoy. Almost his only work besides his plays and novels was a collection of essays entitled 'Moskva i Moskvichi' (Moscow and the Moscowers), which ran to three or four volumes. After a tedious illness, originating in gout, which he combated by homœopathy, he suddenly expired at Moscow on the 23rd of June (o.s.) 1852. Soon after his death a life of him by Aksakov appeared in the 'Moskvitianin,' from which the foregoing particulars have chiefly been taken. His best works have an interest both to the native and foreigner from the purely Russian tone of their language and spirit, as indeed in every country the most popular national romances is a valuable clue to the knowledge of national character.

ZAHRTMANN, VICE-ADMIRAL CHRISTIAN CHRISTOPHER, Hydrographer to the Danish Admiralty, entered the naval service of his country as a cadet in 1805, and afterwards served as a lieutenant in many arduous and perilous undertakings during the war which terminated in 1815; acquiring the character of being one of the most able and accomplished officers of the Danish navy. At the general peace he betook himself entirely to geodetical and hydrographical labours; among which he assisted the late Professor Schumacher in the measurement of the Danish arc of the meridian. After a cruise to the West Indies, during which he made a chart of a portion of their seas, and set up an observatory on the island of St. Thomas, he was appointed successor to Admiral Lövenörn as director of the Hydrographic Office at Copenhagen. In this capacity, notwithstanding much prejudice respecting the publication of documents, he brought the labours of his department in an available form before the world, and with the highest degree of finish and exactness. The works, so important to the navigators of all nations, on which his fame rests, are the charts of the coasts of Denmark, with accurate soundings between the numerous islands, accompanied by determinations of the currents and trigonometrical surveys of the coast. His chart of the North Sea (1843) was indeed the greatest boon to all seamen, and to those of Britain in particular; whilst the 'Danske Lods' (Danish Pilot), which is a complete description of all the seas surrounding Denmark, has been found so useful that it has been translated, under the direction of Admiral Sir Francis Beaufort, F.R.S., late Hydrographer to the British Admiralty, into both the English and French languages. He was also master-general of the naval ordnance of Denmark, inspector of the chronometer bureau of Copenhagen, and a chamberlain of his sovereign, as well as a knight grand cross of the order of Dannebrog and Dannebrogsmand, and a knight of four foreign orders, Russian, Prussian, French, and Greek.

Admiral Zahrtmann died suddenly on the 15th of April 1853, in the sixtieth year of his age. The estimation in which he was held by his countrymen was evinced by the attendance at his funeral of the princes of the royal family, the ministers of state, the corps diplomatique, and many officers of the naval, military, and civil services.

He was an honorary member of the Royal Geographical Society of London, and communicated to that society, in 1830, shortly after its foundation, an account of Danish discoveries on the East Coast of Greenland in the preceding year: a translation of his official report on which, sent to the Geographical Society of Paris, appears in the first volume of the Journal of the former society. In the same work, vol. v., is an elaborate paper by him entitled 'Remarks on the Voyages to the Northern Hemisphere, ascribed to the Zeni of Venice;' in which, after communications made to the society by him at the conclusion that these voyages, at least in the main points, are mere fabrications.

ZALEUCUS (Ζάλευκος), the celebrated legislator of the Epizephyrian Locrians in Southern Italy, is said to have been the first Greek who committed to writing a code of written laws (Diodor., xii. 20; Clemens Alexandr., 'Stromat.,' i. p. 309; Strabo, vi. p. 259.) It has been supposed that the statement of the Locrians having had the first written laws among the Greeks must be limited to the Greeks of Italy, since it is stated that Zaleucus derived many of his laws from the Cretans, Lacedæmonians, and the Areopagus of Athens; but as it cannot be proved that the Cretans and Lacedæmonians, had any written laws at that time, we must acquiesce in the common traditions that Zaleucus was the first of all the Greeks who composed a code of written laws. He lived in all probability about B.C. 660, but his history, like that of the other early Greek legislators, is involved with fable. Suidas, who describes him as a native of Thurii, Zaleucus was originally a slave and a shepherd; whereas Diodorus (xii. 20) calls him a man of good family. He is further said to have been called upon by Minerva in a dream to legislate for the Locrians; and that the Locrians applied to the oracle about the means of getting rid of their political disturbances, they received a command to legislate for themselves. When Zaleucus announced to them his dream, he was emancipated, and drew up a code of laws for them. (Suidas; Scholiast ad Pind. Pyth., ii. 27; Strabo, x. 17; Aristot., fr. 1. Ext. p. 1574. a. Aristotel. apud Clem. Alexandr. 'Strom.,' i. p. 352.) A great portion of his laws was derived from the customs of other Greek states, but he was the first who fixed punishments for the crimes enumerated in his code; whereas before his time the punishment had always been left to the discretion of the judges. His laws, of which several fragments are still extant, were according to the unanimous opinion of the ancients very severe, but the Locrians observed them for a long period, during which they are called the "most observant of law and order" (εὐνομώτατοι) of all the Greeks. (Zenobius, v. 77; Diogen. Laert., iv. 94; Apostolius, 'Proverb.,' x. 50; Marcian Heracleot., 345, &c.)

The code of Zaleucus embraced the religious and moral as well as the civil and political duties of the people, and entered so much into the details of private life that it regulated even the dress by which the women should be distinguished from other females. Although Zaleucus, as has been shown incontrovertibly by Bentley, must have lived before the time of Pythagoras; both Suidas and Diodorus call him a disciple of that philosopher, an anachronism which arose out of the desire of the ancients to trace all practical wisdom to Pythagoras, as was the case of the Roman king Numa Pompilius who is likewise called a disciple of Pythagoras. The common story about the death of Zaleucus is as follows:—One of his laws forbade the citizens of Locri to enter the senate-house in arms; but on one occasion, while they were at war, Zaleucus, forgetting his own law, entered the senate-house as a warrior; and when one of the persons assembled called out to him that he was violating his own law, Zaleucus threw himself on his sword, and thus punished himself. (Eustathius ad Hom. 'Iliad,' i. p. 62.) But the same story is related by others of Charondas, with whom Zaleucus is frequently confounded by the ancients themselves (Valer. Max., vi. 5, Ext. 4; Diodor., xii. 20); and Suidas states that Zaleucus fell fighting for his country. The contradictions and fables which occur in the history of Zaleucus led some sceptical writers among the ancients, such as Timæus, to deny that a legislator Zaleucus ever existed. (Cicero, 'De Legib.,' ii. 6: 'Ad Atticum,' vi. 1.)

(Fabricius, *Bibliotheca Græc.*, ii. p. 1, &c.; Bentley, *Dissertation upon the Epistles of Phalaris*, p. 241, &c.; Heyne, *Opuscula Academica*, vol. ii., where the fragments of the laws of Zaleucus are collected.)

ZALUSKI, JOZEF ANDRZEJ, or JOSEPH ANDREW, the founder of the great Zaluski library, the largest collection ever formed at private expense, was born in 1701, and was the son of a Polish nobleman, who was Waywode of Rawa. The family gave several dignitaries to the church; Joseph's uncle, Andrzej Chrysostom, author of a series of letters often quoted by Polish historians, the 'Epistolæ Zaluscianæ,' published in four folio volumes, was bishop of Warmia; his elder brother, Andrzej Stanislaw, was bishop of Cracow; he himself became bishop of Kiev. The chief business of his life was the collection of books. Even when a young man it was seen, with surprise, that he stinted his table to enrich his library, and after a frugal dinner supped on "a morsel of bread and cheese." The position of his uncle, who was chancellor to King Augustus II. of Saxony and Poland, introduced his nephew to early favour at court, but when, on the death of Augustus, the contest for the accession arose between his son Augustus III. and Stanislaus Leszczynski, Zaluski espoused the cause of Stanislaus, who sent him to Rome as his ambassador to the pope. From Rome he repaired, after three years, to the court of the expelled Stanislaus in Lorraine; but, after a time, made his peace with the possessor of the throne, and returned to Poland. Here, in conjunction with his brother the Bishop of Cracow, he exerted himself to form a library, such as Poland had never seen, and fully succeeded. He spared no expense, and, according to Lelewel, the historian of Polish libraries, he hardly shrunk from any means to accomplish his purpose, and finally, almost all that was valuable in the scattered monastic and other libraries of Poland, became concentrated in the great collection of Zaluski. His aims were generous; the two brothers made their library to the public in 1747, in a separate building, fitted up at their expense at Warsaw. The Bishop of Cracow died in 1758; the surviving brother continued to devote his fortune and his cares to the augmentation of the library, in which he spent most of his time as a reader. In 1757 he was deprived of even this pleasure. Taking part in a demonstration made by several of the Polish bishops at the Diet against the Dissidents, whom they denounced in a spirit as impolitic as it was uncharitable, Zaluski was seized by order of the Russian ambassador Repnin, and sent to Kaluga, where he remained on compulsion for some years. He was allowed as an indulgence by the Russian government to purchase 3000 volumes from Holland to console him in his solitude; but his thoughts still dwelt on his own library, and he employed part of his time in drawing up a bibliographical work from memory on the authors whom it contained who treated of Russia. When, at length, in 1763, he was allowed to return to Warsaw, he declared that he was nearly killed by grief by the state in which he found his cherished collection. The librarian, Janocki, a very eminent bibliographer, had become nearly blind; a sub-librarian, who had been appointed to assist him, had plundered the institution by selling the books, and everything was in a state of decay. Early the next year, on the 9th of January 1774, Zaluski died. The fate of his library was as remote as possible from his desires. He had provided by his will in 1761 that the Jesuits should have the management of it after his decease, but this bequest was suppressed before his death, and it fell under the jurisdiction of a new committee of education. By his expenses in acquiring it he had burdened his estates with a debt of 400,000 florins; the heirs of his property applied to the state for an equitable compensation, and their claim was admitted to be reasonable, but, in the then state of Poland it is not surprising that no compensation was ever paid. Some of the monastic libraries from which he had acquired valuable books complained that they had not received a proper return, and were only quieted by being presented with some of the duplicates. No funds being allotted to the library it received no augmentations after Zaluski's death. In the year following that event, the unfortunate Janocki became completely blind, and for some years that followed while he was at the head of the library, plunder was carried on on a large scale. A bull which Zaluski had procured from the pope to excommunicate any one who removed a book, appeared to be worse than useless. Finally came the great misfortune of all. At the partition of Poland in 1795, Russia seized on the Zaluski library as the property of the state, and it was conveyed in a mass to St. Petersburg. Much of it, it is said, was lost on the way, but when what arrived was counted it was found to amount to the enormous mass of 262,640 volumes, and about 25,000 engravings. It is curious to remark that among all these books only 25 were in the Russian language, and that in the great library of Poland the number in Polish (4051) was less than the number in Polish (4368). The great mass was in Latin, French, and German, and more than 80,000 of the volumes were on theology. At the time of Zaluski's death in 1774, this library, amassed by a private individual, was of much more than twice the extent of the library of the British Museum—the national collection of England. When, however, in 1814 the Emperor Alexander went over the Museum Library, and remarked, as he then well might, on its scantiness, the librarian Planta is said to have replied that if small it had at all events been honestly acquired, and the emperor was silent. For many years after its transfer the Zaluski library, or as it is now called 'The Imperial Library at St. Petersburg,' continued to remain unaugmented, and the first accessions of importance it received were from the confiscated Polish libraries of Prince Czartoryski at Pulawy, and the 'Friends of Science' at Warsaw. Of late it has received large additions by purchase, and now takes a high position in Europe, but it is a collection on which however splendid it may become, no Russian can ever look with a feeling of legitimate pride.

As an author, the name of Zaluski does not stand high, and indeed, when it is considered that he was a man of very extensive reading, and in early life had travelled in Italy, France, and England, the character of his writings excites our surprise. One which has been already referred to as composed at Kalnga, the 'Bibliotekа Historykow Polskich,' or Library of Polish Historians, was first published under the editorship of Muczkowski at Cracow in 1832. This bibliographical work, strange to say, is composed in a species of blank verse. One chapter is on English writers in Poland, and commences thus:—

> "Anonim pod tytulem 'New Account' zelazja
> O Polsce, Litwie, wydai i to co sie dzialo
> Od smierci Krola Jana,'" &c.
>
> Under the title of the 'New Account'
> An author, name unknown, published a book
> On Poland and on Lithuania too, &c.

The contents of the whole volume are of a similar cast. Another book by Zaluski is a sort of autobiography in verse of the dryest description. He ventured to translate some plays from Metastasio and Voltaire; but these efforts are spoken of as of a piece with the 'Bibliotekа.' Some pamphlets against the Dissidents, a short history of the noble house of Jablonowski, &c., are the most conspicuous of his other publications.

ZAMOYSKI, or ZAMOSC. The Polish house of this name occupies a distinguished place in the annals of that nation. It is a branch of the family of Saryusz, and has given three eminently distinguished men to Poland.

JOHN-SARIUS-ZAMOYSKI, grand-chancellor of Poland, was born at Skokew, of which his father was castellan, in the palatinate of Culm, on the 1st of April 1541. John was destined by his parents to prosecute his studies, at the age of twelve years, and on his first arrival was received into the service of the dauphin, afterwards Francis II. Finding however that the duties of this appointment interfered with his studies, Zamoyski quitted the court, and went, to use his own expression, to hide himself in the 'pays Latin.' His favourite pursuits in the university of Paris were mathematics, philosophy, and jurisprudence. At the request of his father he subsequently repaired to the university of Strasbourg to perfect himself in the study of Greek, and to Padua to complete his legal studies.

At Padua the study of the canon law led him to pay considerable attention to the writings of the Fathers, and this pursuit is believed to have confirmed his devotion to the Romish Church, to which his father's allegiance had been shaken. While at Padua he published several works, which were favourably received at the time, and have maintained their reputation. In 1562 he published the funeral oration which he delivered on the celebrated Faleppio. In 1563 he published an essay on the constitution of the Roman Senate, 'De Senatu Romano Libri II.,' so learned and critical, that De Thou attributed it to Zamoyski's teacher Sigonius, and Grævius has inserted it in his 'Thesaurus Antiquitatum Romanarum.' Having been elected rector of the university in 1564, Zamoyski caused a collection of its privileges to be made, and published a digest of them under the title 'De Constitutionibus et Immunitatibus Academiæ Universitatis Paduanæ.' In the same year he published a treatise on the duties of the magisterial office, entitled 'De Perfecto Senatore syntagma.'

The reputation which he carried back with him into his native country obtained for him speedy preferment. Sigismund Augustus, then king, after admitting the young scholar to several private interviews, placed him under the direction of the chancellor, in order that he might be instructed in the practical details of public business. About 1569 he was employed to arrange the documents in the public archives, which had fallen into great confusion after the departure of Cromer. This laborious task engrossed his whole time for nearly three years; but the notes which he made, while deciphering and arranging the ancient manuscripts with a view to the compilation of a catalogue, were afterwards of inestimable service to him in his public career. In 1572 Zamoyski married the daughter of the full head of the Oseslinski family; but his wife did not long survive their union, and his father died about the same time. The king, who had not long before bestowed one of the crown domains upon the bereaved husband as a mark of his satisfaction, expressed much sympathy with him, promised to be to him in lieu of a parent, and appointed him starost of Bielsk, an appointment which had been held by his father. But Sigismund did not live long to fulfil his promise, sod with his death (7th July 1572) commences the political life of Zamoyski—a long and chequered career of more than thirty years.

The General Diet for the election of a king was not summoned to meet at Warsaw till the commencement of 1573. In the mean time the equestrian order had organised itself with a view to counterbalance the influence of the senate by its union. Zamoyski was by common consent regarded as leader of this confederation. He caused the choice of the Diet to fall upon Henri of Anjou, and his reasons were not devoid of weight. Iwan IV., czar of Moscovy, was his first choice, but that prince having refused to solicit for the crown, on the ground that his election was a matter of more consequence to the Poles than

Digitized by Google

to him, Zamoyski, fearing the consequences of crowning such a proud spirit, turned his eyes to the other competitors. He was averse to the Emperor Maximilian I. for two reasons: because the Imperial policy would have involved Poland in a war with the Turks; and because the Austrian pride was insupportable to the Polish nobles. Henri, on the contrary, was of a nation which cultivated a good understanding with the Porte, and was remarkable for urbanity, and could not bring a French force to act against the Poles so easily as their Austrian neighbour. Zamoyski's familiarity with the archives of the kingdom enabled him to be of great use in suggesting precedents for the formal conditions upon which the crown was offered to Henri; and he was placed at the head of the deputation sent to Paris to intimate the result of the election to the new king. The speech he made on the occasion has been much praised for the justice of its ideas, the elegance of its style, and the delicacy with which the speaker praised Henri without disparaging his competitors. It was published at Rome in 1574. The new king appointed Zamoyski grand-chamberlain and starost of Kry-zyn. Great discontent was excited by Henri's refusing to confirm the pacta conventa presented to him by the Dissidents before his coronation; and Zamoyski's popularity with his order was shaken for a time by his defending the conduct of Henri on this occasion. He regained it however before the precipitate retreat of Henri from Poland.

Zamoyski and the equestrian order now turned their eyes to Stephen Bathori as the only candidate likely to counterbalance the influence of the House of Austria. The crown was offered to Bathori on the condition of his marrying Anne, sister of Sigismund Augustus, the assent of that princess to the arrangement having been previously obtained. The Diet was convoked on the 14th of January 1576; Bathori was proclaimed king, and while the Austrians hesitated what course to adopt, he advanced by a rapid march to Krakau, and was crowned there. He testified his gratitude to Zamoyski by nominating him grand-chancellor, a choice so agreeable to the equestrian order that they rose in a body and approached the throne to thank the king.

During the greater part of the ten years' reign of Bathori, Zamoyski was his chief and confidential councillor. By his advice Bathori's first cares were directed to replenish his empty treasury and reunite the provinces of his distracted kingdom. With the view of opening a peace were made to Austria, and envoys despatched to Rome to persuade the noble political emigrants who had sought refuge there to return. To the hostile indications from the Muscovites and Tartars, a zealous care to avoid furnishing them with a pretext for hostilities was opposed. Bathori marched against Danzig, which he forced to capitulate: Zamoyski dictated the conditions.

In 1579 the storm from the side of Muscovy broke in upon Livonia. Bathori convened the Diet, and exhorted its members to avenge the insult. Some deputies were of opinion that hostilities should be commenced against the Tartars also; but Zamoyski's prudent advice to finish with the Russians before they engaged with another enemy, backed by his representations that by attacking the hordes dependent on the Porte they would bring that power also upon them, carried the day. The necessary subsidies were voted, and the campaign commenced. The address of Zamoyski also obtained from this Diet its sanction of a new judicial organisation of the kingdom, in consequence of which courts of appeal were established at Lublin and Petrikau.

The campaign was successful; Bathori conducting the military operations, and Zamoyski, who accompanied him everywhere, relieving him of the load of civil affairs. The Diet of 1580 was a stormy one: the enemies of Zamoyski, irritated by his favour with the king, endeavoured to thwart his policy. At last the subsidies were granted, and military operations resumed with success. In 1580 Bathori undertook the siege of Pleskow, leaving Zamoyski at the head of the main army with the title of Hetman. The soldiers murmured at being placed under one whom they considered a mere scholar and civilian; and perhaps the severe discipline which the fastidious morality of the scholar induced Zamoyski to enforce rendered a considerable degree of discontent unavoidable. He remained however at the head of the army till the conclusion of a peace, in January 1582, the negociations of which were left entirely to his management.

By that treaty the cession of Livonia, Esthland, and Norogorod, Zamoyski set his troops in motion as soon as the treaty was signed. The Swedes had already entered Livonia, but his prompt measures frustrated their intentions. At the Diet which was held in October 1582, Tartar envoys appeared to demand tribute: the Poles replied by despatching Zamoyski to the front: r, which he placed in a state of defence, and thus awed the enemy into inaction. On his return to Krakau he received in marriage a niece of the king: the nuptials were celebrated by a magnifice nce almost regal.

From this time however till the death of Bathori, Zamoyski took comparatively little ostensible part in public affairs. He retired to his native place, Skokow, and busied himself in colonising his estates and instituting colleges and printing-presses. This retirement has been plausibly enough said to have been prolonged by the odium he incurred through the active part he took in urging on the execution of Samuel Zborowski (May 25, 1584).

After the death of Bathori however (December 13, 1586) it became manifest that though Zamoyski's enemies were powerful, his hold upon the national mind was not materially weakened. The partisans of Zborowski mustered, it is true, in such force at the Diet as to force that body to remove him from the command of the army. By the advice of his friends he fled secretly at the moment, but only to collect troops, and to encamp on the 30th of June (the day appointed for the election), at the head of 10,000 horsemen, on the right bank of the Vistula, directly opposite Warsaw. The Zborowski mustered in force on the opposite bank: but Zamoyski prevailed, and his candidate, Sigismund III., was chosen. The Zborowski protested against the election, and sent deputies to their candidate, the Archduke Maximilian, brother of the Emperor Rudolph, inviting him to assert his claims by force of arms.

The King of Sweden hesitated to hazard his son in so anarchical a kingdom as Poland; but the prince himself, at the invitation of Zamoyski, accepted the offered crown. On landing at Danzig he was met by messengers, who brought news of the defeat of Maximilian in the neighbourhood of Krakau by Zamoyski, and urgent solicitations from the grand-chancellor to hasten his march. Sigismund entered Krakau on the 29th of December 1587, and was presented by Zamoyski to his victorious army as their king. After this ceremony Zamoyski marched in pursuit of Maximilian, who had retreated into Silesia. The archduke was obliged to surrender; and the Diet of 1587 decreed that he should be retained as a hostage until his brother the emperor should give security for his renouncing the Polish throne. The pope interfered in the affair, but the negociations were protracted. At last Maximilian consented to relinquish his pretensions, was set at liberty, and conducted to the Austrian frontier, which he no sooner crossed than he announced his resolution not to keep the promises he had made while a prisoner. This breach of faith elicited a pamphlet from Zamoyski, published in 1590, with the title 'Pacificationis inter Domum Austriacam ac Regem Poloniae et Ordines Regni Tractatus, Scripta aliquot.'

The next seven years of Zamoyski's life were consumed in a double struggle between foreign foes, against whom he had to make head, and domestic factions, from whom he had to wring a reluctant support. The king was not his friend, for Zamoyski thwarted his wishes on many occasions, but could not dispense with him. Amid all these difficulties the grand-chancellor defended the Ottoman army in 1591-2, barred the retreat through Poland to the Tartars, who had made a predatory incursion into Hungary, in 1593; defeated the Turks in Wallachia in 1595, and again in 1596; and the Swedes in 1597. After the last campaign, conscious that his physical powers were giving way, he resigned the command of the army to his lieutenant, John Charles Chodkiewicz. From this time till 1605 Zamoyski remained in retirement, occupied with his colonies and literary pursuits. The fruits of the latter were given to the world under the title 'Dulcium Chrysippea.'

He emerged from his retreat in 1605 to attend the Diet, and there is a wild grandeur about this the closing scene of his public life. The first wife of Sigismund III., an Austrian princess, was dead, and he was bent upon marrying her sister. Zamoyski, who had opposed the first marriage, was still more hostile to this: he was firmly convinced that the interests of Poland required an intermarriage with the royal family of Rnasia. The debate became violent. The grand-chancellor, laden with years and infirmities, had resolved to take no part in it, but the contagious excitement of the scene rendered him incapable of adhering to his resolution. He caused his seat to be placed near the throne, and after apologising for his liberty on account of his debility, presumed to address the king in a strain that has rarely been heard by princes. He declared his opinion that the king should concentrate his attention on the Swedish war with a view to terminate it; he reminded him that he had often before sacrificed the interests of the state to his own private ends; he protested against the marriage with an Austrian princess as likely to be fatal to Poland. Nor did he stop here: he accused the king of intending to secure the crown for his son in violation of the constitution, and of corresponding clandestinely with foreign powers; and he reminded him in a tone of increasing asperity that the Poles had ere then deposed and banished kings with whom they were offended. Sigismund, irritated by such language, replied with equal violence, and at the conclusion of his speech laid his hand on his sword. At this the senate and deputies quitted their seats in a body with threatening murmurs; but the voice of the old chancellor was heard above all the din—"Withdraw your hand from your sword, prince; do not oblige history to record that we were Brutuses and you a Cæsar."

At the close of the Diet Zamoyski retired again to his estates. On the 3rd of July 1605 his attendants, who had fancied him sunk in meditation, found on approaching his chair that he was dead.

Zamoyski was an elegant scholar, an accomplished diplomatist, and a successful general. That he should have been able to keep himself at the head of affairs during a period of nearly thirty years, in so turbulent a state as Poland, is of itself a guarantee of the power and energy of his character. His writings, even at this distance of time, are calculated to please by their elegance, and by the knowledge of human nature that they display. His stern stoicism was the necessary consequence of a highly-cultivated mind forced to combat during the better part of his life with the factions of a fierce oligarchical state. The part of his career upon which the mind feels most pleasure is

Digitized by Google

dwelling consists of the occasional retirements from public business during which he devoted himself to colonising his estates and promoting literary institutions. About 1585 he laid the foundations of Nowy Zamosc, distant about two miles from Stary Zamosc (old Zamosc). He encouraged manufactures there, and fortified it so strongly that it came to be regarded as one of the chief defences against the Tartars. He established a printing-press, which became celebrated for the beauty of its impressions. On the 15th of May he opened the University of Zamosc, to which he attracted the most eminent scholars of the nation, with a solemn and inaugural oration. He granted lands in perpetuity to some of his vassals, and encouraged the adoption of improved methods of agriculture.

Interesting particulars respecting these labours of Zamoyski are contained in the narrative of two journeys made by Father Vanozzi to Poland to visit Zamoyski, published by J. W. Niemcewicz at Warsaw in 1822, from a manuscript in the Albani Library at Rome.

JOHN ZAMOYSKI II., born in 1626, was the grandson of the preceding. He was created, soon after he obtained his majority, castellan of Kalisch, and was present in that capacity, in 1649, at the coronation of John Casimir. He accompanied that king in his campaign against the Cossaks in 1651, and earned by his bravery the appointment of palatine of Sandomir. He distinguished himself equally in the disastrous War of Succession, when Poland was devastated by Swedish armies: he stood a long siege in his hereditary fortress, Zamosc; and it was to his vigilant keeping, as commandant of Warsaw, that Marshal Wisniowetz, President von Enk, and other important prisoners were intrusted. In 1659 he commanded the army raised to oppose the encroachments of the czar in the Ukraine. In 1663 he was one of the nobles who remained faithful to John Casimir, and was mainly instrumental in allaying the discontent of the insurgents under Chwiedetski. John Zamoyski died suddenly at Warsaw, on the 2nd of April 1665, while attending the Diet at Warsaw. He left no family by his wife, daughter of the Marquis de la Grange d'Arquin, and called in Poland 'La belle Française,' who afterwards married the great Sobieski. Zamoyski dying without heirs of his body, his estates passed to his two sisters.

ANDREW ZAMOYSKI, a younger son of a descendant of these two sisters, who had inherited the fief of Zamosc, was born at Biezun in 1716. He received his education in the college of the Jesuits at Thorn, where he remained till 1736. In 1735 his father died, and Andrew left Poland to visit foreign universities. He passed two years in the University of Liegnitz in Silesia; in 1739 he visited Paris, where his favourite studies were mathematics and jurisprudence; and he returned home in 1740. Finding his brothers engaged in litigation about the division of their inheritance, he reconciled them by giving up his share, and entered the service of Saxony. In 1745 he obtained the command of Prince Albert's regiment. In 1754 he quitted the army and returned to Poland with the rank of major-general. He was appointed marshal of the palatinate of Smolensko, an office which put it in his power to reform abuses which had crept into the judicial and administration of the province. In 1760 he emancipated all his serfs: a few noblemen imitated his example, but the greater number declaimed fiercely against the innovation.

At the first Diet held after the death of Augustus III. (1763) Zamoyski contributed much to the passing of a law for the reform of administrative abuses. In 1764 the new king, Stanislaus Augustus, made him keeper of the great seal. The influence which this appointment enabled him to exercise over every branch of administration, he employed in giving a better organisation to the army and the educational institutions of the kingdom. When the partizans of Russia, in the Diet of 1767, procured the banishment of Gaetan Soltyk and Zaluski, bishops of Krakau and Kiew, along with some other nobles, to Siberia. Zamoyski resigned the seals in disgust, declaring he would never receive them back till those illustrious victims were restored to their native country.

In his retirement he employed himself in promoting education, and completing the code he had undertaken to digest at the request of the Diet of 1776. He completed the work in less than two years. The matter is arranged under three heads: the first treats of persons; the second, of things; and the third, of courts of law and actions. It was printed at Warsaw, in Polish, in 1778: a German translation by Godfrey Nikiaz appeared at Dresden in 1780. The code, when printed, was sent to all the palatinates, in order that it might be discussed in their provincial assemblies before it was submitted to the Diet. The provision for a general measure of emancipation excited an almost universal hostility against it. The deputies were without exception instructed to oppose it in the Diet of 1780. When the marshal, as president of that assembly, named the reading of the new laws, he was met by a burst of opposition from all parts of the hall. It was decided that they should not even be read; some went so far as to propose a resolution that they should not be presented to any future Diet. Casimir Poniatowski, the king's brother, was the only member of the Diet who ventured to say a word in vindication of them.

Zamoyski, who had attained his seventieth year when his code met with this rude reception, withdrew himself in consequence of it still more from public affairs. In 1790 he undertook a journey to Italy. At Bologna he received the intelligence that the Poles had proclaimed the constitution of the 3rd May, 1791, and adopted his code. He made haste to return to Poland, but did not survive long to enjoy his triumph, dying at Zamosc on the 10th of February 1792, in the seventy-sixth year of his age. His widow, a princess Czartoryska, deservedly celebrated for her active benevolence, died at Vienna on the 19th of February 1796.

ZAMPIERI DOMENICO. [DOMENICHINO.]

ZANCHI, a family of Bergamo, in Lombardy, which produced several men of learning in the 16th century. Paolo Zanchi was a distinguished jurist, and also an antiquary, and a collector of ancient inscriptions. Three of his sons, Basilio, Gian Grisostomo, and Dionigi entered the order of the Regular Canons of the Lateran.

BASILIO ZANCHI, born in 1501, went to Rome under Leo X., and was noticed at that court as an elegant Latin poet. After Leo's death he returned to Bergamo, and applied himself to theological studies, and entered the order of the Regular Canons in 1524. He wrote comments on the Bible, which are published. He was also well versed in Greek. His life was unfortunate. It appears that he had made free use of the liberty, then frequent among members of the monastic orders, of living out of his convent, and travelling about Italy. Pope Paul IV., in 1558, issued an order commanding all such persons to return to their respective convents under severe penalties. Zanchi having endeavoured to elude the order, was put in prison at Rome, in which city he then was, and he died in prison at the end of that year. Serassi has written a good biography of Basilio Zanchi, which he has prefixed to the edition of his Latin poems in eight books, 'Zanchi Poemata,' Bergamo, 1747. Among other poems there is one consisting of 1,000 hexameter verses, in which he explains the principal dogmas of the Christian religion. Zanchi wrote also 'Latinorum Verborum ex variis auctoribus Epitome.'

GIAN GRISOSTOMO ZANCHI, his brother, published a work on the ancient history of his country: 'De Orobicorum sive Cenomanorum Origine, Tribus libris, Venice, 1531, which he dedicated to Pietro Bembo. The work is deficient in historical criticism, but it may be useful on account of the numerous inscriptions of the town and territory of Bergamo which it contains. Gian Grisostomo, after filling the first dignities of his order, died in Bergamo, in 1566.

GIROLAMO ZANCHI, a cousin of the preceding, was born in 1516, at Alzano in the province of Bergamo; he likewise entered the order of the Regular Canons of the Lateran, in which he lived for many years, and was a fellow-student of Celso Martinenghi of Brescia, a friend of his order. While in that convent he became acquainted with Pietro Martire Vermigli, who was a dignitary of the same order, embraced the doctrines of the Reformation, and was in consequence obliged to fly from Italy to Switzerland, in 1542, Zanchi and Martinenghi, who had become secretly imbued with the same doctrines, thought it prudent to emigrate also. Zanchi went first to Lucca, was the first to leave Italy, and he went to Geneva, where he was put at the head of the Italian Reformed congregation. Zanchi followed his friend's example, and after several vicissitudes he went to Heidelberg, where he taught divinity. He acquired so much reputation for theological science, that it was said by the learned John Sturm, that if Zanchi alone could be sent to dispute with the Roman Catholic divines assembled at Trent, he should not be afraid of the result. The papal nuncio Zaccaria Delfino had private conferences with Zanchi in 1561, for the purpose of reclaiming him to Catholicism, but in vain. Zanchi however he failed. Zanchi's theological and controversial works were published in eight volumes after his death: 'Zanchii Opera,' Geneva, 1619, and they contain two books of letters, in which are particulars of his life. He died at Heidelberg in 1590. G. Gallizoli of Bergamo has written a biography of Girolamo Zanchi, published at Bergamo in 1785.

Francesco Zanchi, father of Girolamo and first cousin of Paolo Zanchi above mentioned, wrote a small historical work, 'Commentarius de Rebus à Georgio Hemo præclare gestis in primo adversus Maximilianum Romanorum Regem Bello a Venetis suscepto.'

ZANOTTI, GIAMPIETRO CAVAZZONI, distinguished alike for his paintings and his writings, was born of Italian parents at Paris, in 1674. He was however removed in his tenth year to Bologna, where he was placed in the school of Lorenzo Pasinelli, then one of the first painters of that city. Zanotti soon displayed great talent, and there are still several fine works by him at Bologna, in public and private buildings; he is however better known for his writings upon art, and few, says Lanzi, have ever handled pen and pencil so well as Zanotti. He published several poems, but the following are his principal works: 1. 'Letters in Defence of Michael Angelo.'—'Lettere Familiari scritte ad un Amico in Difesa del Conte Carlo Cesare Malvasia, Autore della Felsina Pittrice,' 8vo, Bologna, 1705. 2. Life of L. Pasinelli—'Nuovo Fregio di Gloria a Felsina sempre pittrice nella Vita di Lorenzo Pasinelli, Pittore Bolognese,' 4to, Bologna, 1708. 3. History of the Clementine Academy of Bologna—'Storia dell' Accademia Clementina di Bologna aggregata all' Instituto delle Scienze o dell' Arti,' vol. 2, fol, Bol. 1739. 4. Hints to a young Painter—'Avvertimento per lo Incammminamento di un Giovine alla Pittura,' 8vo, Bol., 1756. 5. Works of P. Tibaldi and N. Abbati in the Institute of Bologna, &c.—'Descrizione ed Illustrazione delle Pitture di Pellegrino

Digitized by Google

Tihaldi e Nicolò Abbati, esistenti nell' Instituto delle Scienze,' &c., fol., Venezia, 1760.

He wrote also a Life of Eustachio Manfredi, and several volumes of poems by him were published at different periods in Bologna. He was secretary to the Institute of Bologna, in which his brother F. M. Zanotti held the chair of philosophy. Giampietro has written his own life in his history of the Academia Clementina. He died at Bologna, in 1755, aged ninety-one, and was buried in the church of Santa Maria Maddelena, where there is a monument to his memory, with an inscription beginning as follows:—'Joanni Petro Zanotto, Pistori egregio, Poetæ longe clarissimo,' &c.

(Zanotti, *Academia Clementina*, &c.; Fantuzzi, *Scrittori Bolognesi*.)

ZARLI'NO, GIOSEFFO, the most celebrated of all the Italian writers on the speculative and practical theory of music, and in voluminousness exceeding all, of whatever age or country, who have treated on this subject, Mersenne and Kircher excepted,—was born at Chioggia, an episcopal city in the Venetian States, in 1519, and little more is known of his personal history. Judging from his erudition and mathematical knowledge, it would appear that, though entered as a boy-chorister at St. Mark's, Venice, he was educated for one of the learned professions, and the *recercado* prefixed to his name, which seems to have escaped the observation of musical historians, shows that he was of the ecclesiastical order. It is stated by Sir John Hawkins, on an established fact, though he does not name his authority, that Willaert, his master in the cathedral, prevailed on him to devote himself chiefly to music, which information he must have found in Salinas. He is styled, in the best edition of his works, that of 1589, "Maestro di Capella della Serenissima Signoria de Venetia;" or, in other words, he was director of the music and organist of the state church, St. Mark's, at Venice, in which office he succeeded Willaert. Bayle therefore, in his translation of this title, is not in error, as Hawkins alleges.

Zarlino published his first work, 'L'Istitutioni Harmoniche,' in 1558, from which period, Dr. Burney tells us (who however is in this instance incorrect in his dates), "he was continually revising and augmenting his works." The same author further remarks, that, "the musical science (i. e. its practical part) of Zarlino may be traced in a right line from the Netherlands, as his master, Willaert, the founder of the Venetian school, was a disciple of John Mouton, who was a scholar of the great Josquin." (Wilhelm.) The works of Zarlino, in the edition before mentioned, are in four volumes or parts (quattro volumi), bound up in one thick folio, of which upwards of a thousand pages are devoted to music, and one hundred and forty to the organ. Their titles are—1, 'L'Istitutioni Harmoniche,' divided into four parts. 2, 'Le Demonstrationi,' exemplified in figures in five dialogues. 3, 'I Sopplimenti Musicali,' in eight books. 4. 'Un Trattato della Patienza,' &c.: A Treatise on Patience, most useful to such as would lead a Christian life. "Un Discorso," &c.: A Discourse on the true year and day of the death of Jesus Christ. "Una Dichiaratione della origine del R. P. Capuccini:" Information relative to the origin of the order of Capuchins. "Le Risolutioni d'alcuni Dubij," &c.: All doubts removed concerning the correction of the Julian year, as made by Pope Gregory XIII.

It is evident that Zarlino supplied all subsequent writers on the subject of ancient music with very valuable materials. He was most laborious and indefatigable in his researches, and successful in their results. But it must be admitted that he was ostentatious of his learning, and might have compressed his three first volumes into half the space, with great advantage to himself and his readers. His prolixity has, no doubt, deterred many from proceeding far with him; nevertheless, an experienced person, one who knows how to make the best use of a well informed but verbose and tedious writer, will not regret having looked through, and occasionally studied, the works of Zarlino.

ZECHARI'AH, or ZACHARI'AS (*Ζαχαρίας*), the son of Berechiah, the son of Iddo, was one of the twelve minor Hebrew prophets. He was contemporary with Haggai, and prophesied at the time of the rebuilding of the Temple at Jerusalem. His first prophecy is dated in the eighth month of the second year of Darius (Hystaspes), just two months later than the first prophecy of Haggai (B.C. 520-519; chap. i. v. 1). His is mentioned in conjunction with Haggai in the Book of Ezra (v. 1; vi. 14), where, according to a common Hebrew usage, he is called the son of Iddo. We learn from the above passages in Ezra, that the rebuilding of the Temple, which had been suspended for two years through the opposition of the Syrians, was resumed in the second year of Darius, in consequence of the exhortations of the prophets Haggai and Zechariah; a decree was obtained from Darius to forward the work; "And the elders of the Jews builded, and they prospered through the prophesying of Haggai the prophet and Zechariah the son of Iddo." Of Zechariah's personal history nothing more is known, except that he was a young man when he was called to the prophatic office, and this circumstance confirms the internal evidence of the book itself, to show that his ministry extended over a considerable space of time. The idea that he was the martyr mentioned in Matthew xxiii. 35, seems quite unfounded. The person there meant is evidently Zechariah the son of Jehoiada, whose martyrdom, under the circumstances referred to in the passage of Matthew, is related in 2 Chronicles xxiv. 20, 21, though in Matthew he is called the son of Barachias, probably by the error of a transcriber, who supposed him to be the same person as the prophet Zechariah.

The Book of Zechariah naturally divides itself into two parts. The first part (chaps. i.-viii.) is devoted to the encouragement of the Jews in rebuilding the Temple, by exhortations and by promises, both direct and symbolical. The remainder of the book (chaps. ix.-xiv.) contains predictions relating to the whole future course of time, and more especially to the conquest of the Persian empire by Alexander; the successful revolt of the Jews under the Maccabees from the Greek kings of Syria (chaps. ix.-x.); the rejection of the Messiah and the destruction of Jerusalem (chap. xi.); and the conversion and restoration of the Jews, and the destruction of their enemies in the last days (chaps. xii.-xiv.) It is agreed by almost all commentators that much of the latter part of this prophecy is still to be fulfilled.

The genuineness of the second part (chaps. ix.-xiv.) of the Book of Zechariah has been questioned, but upon grounds so slight, that it is sufficient to refer those who desire to investigate the subject to the works mentioned below. The only argument worth noticing is drawn from a diversity of style, which can easily be explained by the different periods of life at which the prophet wrote the two portions of his book. The genuineness and canonical authority of the book are otherwise undisputed.

Bishop Lowth remarks on the style of Zechariah, that the greater part of his prophecy is prosaic: "Towards the conclusion of the prophecy there are some poetical passages, and those highly ornamented; but the whole is perspicuous, consisting that they are the productions of the most obscure of all the prophetic writers." The obscurity of Zechariah is found chiefly in the images contained in the early part of his prophecy, which are drawn from familiar objects, described so generally as to leave much for the reader's imagination to supply, and accompanied only by slight hints for their explanation, and sometimes left altogether unexplained. A list of commentators of Zechariah is given in the Appendix to the second volume of Horne's 'Introduction.'

(C. C. Rosenmüller, *Scholia in Vetus Testamentum, Propem. in Zech.*; The 'Introductions' of Eichhorn, Jahn, De Wette, and Horne.)

ZEDEKIAH, whose original name was Mattaniah, was the son of Josiah, king of Judah, and uncle of Jehoiachin. When Nebuchadnezzar took Jerusalem the second time, he dethroned Jehoiachin, and placed Mattaniah upon the throne, changing his name to Zedekiah, as was customary when a tributary king was appointed, and was probably intended as a mark of submission. Zedekiah was twenty-one years of age (B.C. 597) when he was set on the throne, and governed the kingdom for eleven years (597 to 586). "And he did that which was evil in the sight of the Lord his God." Wholly swayed by the counsels of his evil advisers, Zedekiah was induced to rebel against Nebuchadnezzar, to whose leniency he owed both his life and his throne; and allied himself with Pharaoh-Hophra, king of Egypt—whom most writers suppose in saying we have no mention in the profane authors —who had been successful in several warlike expeditions. Nebuchadnezzar on learning the revolt, marched an army into Judæa, and besieged Jerusalem. At this crisis Zedekiah sent for Jeremiah, to consult him as to what course he should pursue. Jeremiah counselled him to leave the city and his life by timely submission to the Chaldæans. Notwithstanding the predictions of the prophet, he did not follow his advice; but continued the defence of the city, in hopes that his Egyptian ally would march to its relief. His ally came, the siege was raised, and Nebuchadnezzar advanced against the Egyptians to give them battle, but they retreated into Egypt, and no battle was fought. Nebuchadnezzar continued the siege. When the city had been beleaguered for a considerable time, a famine ensued, and the inhabitants were reduced to the utmost extremities. After a siege of eighteen months the city was taken (B.C. 586) by assault during the night-time. As soon as the king of Judah saw that the Babylonian forces had entered the city, he fled "by the gate betwixt the two walls." These walls are supposed to be two parallel walls which encircled the citadel. Mr. Kitto, in a note to the xxxix. chap. of Jeremiah in "The Pictorial Bible," says that it is likely that the "king went out of the citadel on Mount Zion, between the two walls, and passed from the exterior wall by a way which led through the king's gardens, and which was perhaps a private subterraneous passage. The Jews indeed have a fable that there was a subterraneous way, extending from the king's abode to Jericho, and that by this he endeavoured to escape." He was however seen, pursued, and taken by the Chaldæans, who carried him to Nebuchadnezzar at Riblah, there to have judgment passed upon him. The king of Babylon inflicted on him the most horrible punishment. He ordered Zedekiah's sons to be slain before his face, so as to leave him no hopes of reigning by them; and the agonising sight of the death-throes of his sons was destined to be his last; for he had his eyes then scooped out, which disqualified him for ever reigning again in person. The king of Judah was then bound with fetters of brass, taken to Babylon, and there imprisoned for the remainder of his life. Thus were fulfilled the prophecies of the prophets Jeremiah and Ezekiel concerning Zedekiah. Josephus tells us that Zedekiah thought these prophecies contradictory to each other, and therefore believed neither of them. But both turned out to be true. Jeremiah in xxxii. 4, says, "He shall surely be delivered into the hands of the king of Babylon, and shall speak to him mouth

to mouth, and his eyes shall behold his eyes." This was fulfilled, for Zedekiah was carried to Riblah, and there he saw and spoke to Nebuchadnezzar, but he was also blinded at Riblah; and although he lived at Babylon, and died there, yet he never saw it: thus was fulfilled the prophecy of Ezekiel when he said (xii. 13), "My net also will I spread upon him, and he shall be taken in my snare; and I will bring him to Babylon to the land of the Chaldæans, yet shall he not see it, though he die there." The Temple and the wall of the city were destroyed, a great part of the inhabitants were removed, none but the poorest being left. Thus ended the kingdom of Judah, and from this time begins the long Captivity.

ZEEMAN, REMIGIUS, a clever Dutch marine painter, born according to Pilkington (ed. 1829), at Amsterdam in 1612. His real name was Remigius Nooms, but he received the name of Zeeman, says Heineken, from his painting pictures of marino subjects; he was however originally a common sailor by profession, and he acquired this name probably as much from that circumstance, as his style of painting. He lived some years in Berlin, where, in the royal palaces, there are many of his works; there are some in this country, but they are not common. There are likewise several etchings by him of marine subjects and shipping. He died in the latter part of the 17th century. (Heineken, *Nachrichten von Künstlern und Kunstsachen.*)

ZEGERS, or SEGERS, HERCULES, a clever Dutch landscape-painter and etcher, of Amsterdam, of the 17th century, remarkable for his want of success. He was a painter of great ability and great imagination; some of his landscapes exhibit a surprising extent of country, and are set off by judiciously chosen groups of trees and well-diversified foregrounds. He was however very unsuccessful in disposing of his pictures, and he tried his fortune in etching, but in this branch, though equally clever, he was equally unfortunate. He at last tried his utmost upon a large plate, but when he took it to a publisher for sale, the man offered him merely the value of the copper for it. This so incensed Zegers, that, having told the printseller that the day would come when each print from it would be worth more than he had offered for the plate, he had a few impressions taken off, and then destroyed it. His prophecy soon came true, for even in Houbracken's time a print from that plate sold for sixteen ducats. Zegers, broken-hearted at his bad fortune, took to drinking, and, in returning home one night intoxicated, he fell, and died in consequence of the fall. Houbraken, who quotes B. van Hoogstraten in the account of Zegers, states that he cannot give either the year of his birth or death; in Pilkington's 'Dictionary' however (ed. 1829) the dates 1629 and 1675 respectively are given. Zegers invented a method of printing landscapes in colours upon calico, but his invention was not taken up by any one.

ZELOTTI, BATTISTA, a distinguished Italian painter, and one of the best of the native painters of Verona, where he was born in 1532. He was the scholar of Antonio Badile, but he is said by Vasari to have studied also some time with Titian. Zelotti was the rival of Paul Veronese, at Verona, and he excelled him in some of his frescoes; he surpassed him as a practical fresco-painter, and he is considered by some to have been superior to Paul, both in warmth of colouring and in correctness of design, but he was inferior to him in the beauty of his heads, and in the general grace of his compositions. The invention of Zelotti was fertile, and his compositions full of power, but his reputation was always below his merits, from the circumstance of his being chiefly employed in fresco in the smaller towns and villages or at the villas of noblemen, whence his works were less seen and less known than they deserved to be. One of his greatest works is at Cataio, formerly the villa of the Marquis Obizzi, now of the Duke of Modena, where, about 1570, Zelotti painted a series of frescoes illustrating the services of the Obizzi family. He painted also some excellent works in the cathedral of Vicenza, which have been mistaken by many for works of Paul Veronese. He died about 1592, after a life of much labour for others, but little profit to himself. (Vasari *Vite de' Pittori, &c.*; Ridolfi, *Le Maravigliie dell' Arte, &c.*; Dal Pozzo, *Vite de' Pittori, &c. Veronesi*; Zanetti; Lanzi.)

ZELTER, CARL-FRIEDRICH, by profession an architect, or, as he modestly designated himself, a master-builder—though somewhat late in life he devoted himself entirely to music—was born at Berlin, in 1758. He received a liberal education; and at the age of seventeen he was articled to his father, a Saxon, and a builder. After a long illness from which he suffered in his eighteenth year, an extraordinary passion for music suddenly sprung up in him; but as his time was almost wholly occupied in his professional pursuits, he could indulge only in an evening in his favourite study. In 1783, having completed his probationary architectural drawing, he was admitted as a master-builder, by which more is meant in Germany than in England. And now for the first time he received instructions in counterpoint, from Fasch, to whom he acknowledges himself indebted for whatever merit his compositions possess. He also diligently attended his master's singing academy, a government establishment, and became one of its active members, whereof, in 1797, Fasch having become aged and infirm, he took the management. In 1809 Zelter was appointed, by the king, professor of music to the University and the Royal Institute of Berlin. At the commencement of the same year too, a new society was formed at Berlin, under the title of 'Die Liedertafel' (the Vocal Club), and Zelter was named the president. This was, in fact, a revival, in a much improved form, of the guild of the old German Meister-Sänger, and is now an establishment of even national importance. He died in 1832.

Zelter's compositions are spoken of in high terms by German writers, but they are little known beyond his own country. But while his musical works seem to have been for the most part confined to the place of their birth, his name is become familiar to all who take much interest in German literature. His correspondence with Göthe, published a few years ago, exhibits him as a philosophical, acute musical critic; as a man of general knowledge, of strong mind, and refined taste; and the friendship of the great poet with whom he was in such constant communication, which is so clearly evinced in Göthe's letters, is in itself a guarantee of the intellectual merits of him who enjoyed the intimacy and confidence of one of the most celebrated per-sons of the present age.

ZEMAUN-SHAH. [Shah-Zemaun.]

ZENI, Nicolò Zeno and Antonio Zeno were two brothers, the published accounts of whose voyages have occasioned much controversy. They were Venetians. The word employed to designate the family is Zen, or Zena; to designate a single individual of that family, Zeno; to designate two or more individuals, Zeni. The Zeni a one of the oldest of the patrician families of the mainland territories of Venice. Its first distinguished member, Marin Zeno, lived about the year 1200. The posterity of Antonio Zeno survived the republic, and opened, in 1818, the family archives to the researches of Cardinal Quirini. But for the most part, when 'the Zeni' are spoken of, the brothers Nicolò and Antonio are meant. Their adventures, and the controversies to which they have given rise, shall therefore be first disposed of in the present article, although others of the name, having attained to some notoriety, must be noticed in the sequel.

Nicolò Zeno and Antonio Zeno were sons of Pietro Zeno, surnamed Dragone, and brothers of Carlo Zeno, commander of the Venetian fleet against the Genoese in the war of Chioggia. Their mother's name was Agnes Dandolo. The dates of the births of both brothers are known only from conjecture. Probably Antonio was born in 1326, and had in all ten children. Carlo was born about 1334, of whom it is known that his mother died when he was so young as scarcely to be able to remember her. This necessarily places the births of Nicolò and Antonio between the years 1326 and 1340.

The name of Nicolò appears frequently in the annals of Venice from 1365 to 1388. In 1365 he took a prominent part in the election of the doge Marco Cornaro; in 1367 he was one of the deputies sent to Marseille by the senate of Venice to convey the pope to Rome; he served during the war of Chioggia, in which he commanded a galley, in 1379; he is mentioned as having been considered one of the richest patricians in 1381; in 1382 he was one of the electors who nominated the doge Michiele Moro-ini, and in the course of the same year he was sent as ambassador to Ferrara; towards the close of 1388 he was sent, along with two other nobles, to receive the cession of Treviso from the lord of Padua. After this his name disappears from public history; his subsequent career is only known through a small work published by one of his descendants in 1558.

According to this work, Nicolò Zeno, having embarked on board a vessel of his own to visit England and Flanders, was driven out of his course by a storm, and shipwrecked on the 'island' of Friesland. Here he and his companions were rescued from wreckers by a prince of the name of Zichmni, into whose service Zeno entered in the capacity of pilot, and remained with him one or two years. At the close of that period, having been advanced by Zichmni to wealth and honour for services in war, he invited his brother Antonio to join him, which he did. Nicolò survived his brother's arrival four years, and died in Friesland. It is impossible to ascertain with certainty either the year in which he quitted Venice, or how many years elapsed from his departure to his being joined by Antonio. The year 1380, the date assigned to his shipwreck by his descendant, is evidently an error, for in November 1388, he was still in Italy. Most probably he sailed in 1389; two years at the least must have elapsed before his brother joined him; and he survived that event four years. This brings us down to 1395 as the year of his death. It is certain that he was dead in 1398, for the family register, making mention of his son Tomaso in that year, describes him as the son of the "quondam Nicolò."

Of Antonio Zeno's history previous to his setting out to join his brother in Friesland, nothing appears to be known, except that he was married in 1384. According to the conjectures above stated, he must have arrived in Friesland about the year 1391. He remained there four-teen years in the service of Zichmni, having succeeded at his brother's death to his property and employments. At the end of that time (say 1405) he returned to Venice, where it is probable that he died in the same year; for the passage in the family annals which notices the marriage of his son Dracone in 1406, speaks of him as "quondam Ser Antonio."

The controversy alluded to in the outset of this article relates to the countries visited by the Zeni, and whether their voyages extended to America. In attempting to form an opinion on these questions, it is necessary to keep in view the nature and amount of the information we have respecting those voyages; and with this view we shall set aside all that has been said by commentators, until we have ascertained

Digitized by Google

what the text really says. All that we know is compressed in twenty-seven pages of a very small and not very closely printed quarto volume, printed at Venice, by Francesco Marcolini, in 1558. The narrative purports to have been compiled about that time by a younger Nicolò Zeno, who died in 1565, from the papers of Antonio Zeno. The materials in the possession of Nicolò the younger, at the time he wrote his book, appear to have been only two letters from Antonio Zeno to his brother Carlo, both written after the death of Nicolò. In one of these Antonio mentions that he composed a work descriptive of the countries he had visited or heard of, and their customs, a Life of his brother Nicolò, and a Life of Zichmni. But this book and a number of letters from Antonio had been destroyed by Nicolò the younger when a boy:—"These letters (the letters quoted in the book) were written by Messer Antonio Zeno Carlo, his brother; and it grieves me that the book and many other writings on the same subject have perished wretchedly, I scarce know how; for having come into my hands when I was quite a boy, I tore and dispersed them, as boys will do ('come fanno i fanciulli, le sparacai e mandai tutte a male'), as I cannot now remember without much sorrow." Our knowledge of the voyages of the Zeni therefore rests upon a book compiled about 150 years after the death of the longest liver of the two, from two of Antonio's letters, and such vague recollection as the writer retained of the contents of some manuscripts which had come into his hands and been destroyed by him when a boy. He states, it is true, that the map which accompanies his book was copied from an old and faded map ("marica e vecchia") in the family archives; but he does not assert that it was made by either of the brothers, or even that it was in existence their time. From this review it must be seen that very little we know of the voyages of the Zeni, and how much that little has in all probability been disfigured.

Down to the death of Nicolò the elder, his descendant tells the story in his own person; this part of the book relates the Vikings expeditions, in which Nicolò served under Zichmni. The rest of the book consists in great part of a letter from Antonio to Carlo, in which he rehearses the story of a fisherman who had been shipwrecked on some far western land, and detained there many years, and adds an account of an expedition, fitted out by Zichmni, to visit that country, in which he had accompanied him. The last two pages are occupied with a fragment of another letter from Antonio to Carlo, in which he mentions the book or books he has composed, and adds that he will write no more, as he hopes soon to communicate with him by word of mouth.

The part of the narrative which relates to Nicolò contains the history of three campaigns. In the first Friesland is subdued by Zichmni, who commands the land forces, while Nicolò Zeno co-operates with the fleet. Zichmni then visits the island of Porland, half a day's sail from Friesland, which he had wrested the previous year from the king of Norway; and of the duchy ('duchea') of Sorano on the mainland ('fra terra') on the side next Scotland. Friesland was an island rather larger than Ireland. From the part of the coast where Nicolò was wrecked, he conducted the fleet of Zichmni to the west, and, after conquering several small islands, turned into a gulf called 'Sndero,' and captured in a port called 'Sanestol' some ships loaded with salt-fish. Here he was joined by Zichmni, who had marched over-land. Zeno again set sail to the west, and reached the opposite headland of the gulf: the sea, it is remarked, was full of shallows. He next returns to a part of Friesland named Bondendon, where he learns that Zichmni has conquered the whole island. He sails thence to Friesland, "the capital of the island, situated in a gulf on the south-east, to which there are many in the island, in which fish are taken in such abundance that many ships are laden with them, and Flanders, Bretagne, England, Scotland, Norway, and Denmark send there for supplies, and are much enriched." In all this part of the narrative the only hint given of the position of the countries is that Sorano "on the main" is on the side opposite Scotland. Were it not for the epithet 'island,' applied to Friesland, there is nothing incompatible with the notion of the country so named being the Friesland of the present day. There are even some points that coincide with it. Sailing westward from the part of Friesland which he was thrown upon, Zeno turns into the Gulf of Sndero (the Zuyder Zee?), and the capital of Friesland is situated within a gulf to the south-east (the Dollart?). The Zuyder Zee is full of shallows ("pieno di secsegne"). The bays of Friesland were at that time frequented by vessels from all the countries enumerated, seeking for cargoes of fish. There are small islands ('isolette') in abundance between the Texel and the mouth of the Ems.

The second campaign was undertaken by Zichmni against Estland, which is between Friesland and Norway ("sopra la costa tra Frislanda e Norvegia"). The expedition does not reach Estland, but is driven by a storm upon Grisland, a large but uninhabited island. No mention is made of the relative position of Grisland to any of the other countries mentioned, nor of its distance from them. From Grisland an expedition is made against the islands and Island ("le islande" and "Islanda che medesimamente con l'altre era sotto il Re di Norvegia") to the north. The expedition fails, but seven other islands in the same narrow seas ("negli stessi canali l'altre isole, dette islande, che sono sette") are conquered, a fortress erected in one of them, named Bres, and Nicolò Zeno left to winter there. Zichmni returns to Friesland. Our indications are here still fainter. Proceeding on the supposition that the Friesland of the Zeni may have been the country then and still so called, Estland (the land to the east), between Friesland and Norway, may have been the Danish peninsula. 'Islanda' and 'islande' appear to be merely the singular and plural of the Teutonic word island: the one cannot, and the other does not necessarily apply, to Iceland. Bres approximates to Bressay, the name of one of the Shetland Islands.

The third campaign of Nicolò Zeno was a voyage of discovery he undertook from Bres. He set out in the month of July, and sailed to the north (or north-west) till he reached Engroneland. The distance is not given, but the whole description of Engroneland applies to Iceland, and is applicable to no other country. "There are," it continues, "the hot springs": the brief summer; the early introduction of Christianity and the Latin language; the commerce with Norway—"Vengono molti navigli dal capo di sopra Norvegia e dal Tradon" (Drontheim?). The greater part of the priests we are told are "delle Islande"—from the islands; another corroboration of the opinion that Islanda, as used in this narrative, is not the proper name of any one country. These indications are extremely vague; but there is nothing in them incompatible with the notion that Friesland is Friesland; Engroneland, Iceland: and the intermediate Bress, the Bressay of the Shetland group.

There remain—Antonio Zeno's report of the story of the shipwrecked fisherman, and his account of Zichmni's expedition in search of the lands described by the fisherman.

The fisherman's story need not be minutely examined here. Antonio's recollection of it is sufficiently true to show that it is really an imperfect account of one of the many accidental or premeditated visits paid by the Northmen of Europe, in these early ages, to the northern regions of America; but it is too succinct and disfigured to add anything to our knowledge of these expeditions: the only importance is derived from its having been the motive to Zichmni's voyage of discovery to the west.

This expedition, after labouring for many days among the islands and shallows which were the scene of Nicolò Zeno's first campaign, pushed out into "the deep sea" in the beginning of July. Clearly was the voyage fairly begun, when a tempest broke loose and tossed the vessels about for eight days, swamping some of them, and leaving the surviving crews entirely ignorant of their whereabout. On the return of good weather, Zichmni steered to the west, and reached an island which Zeno calls Icaria, adding, that the inhabitants said the name was derived from their first king, a son of Dedalus, king of Scotland. Every attempt to make good a landing on the territory of the Scotch colony having proved unavailing, Zichmni continued his voyage to the west for six days, at the termination of which he was assailed by another tempest, and forced to scud before the wind till he was driven to a land unknown to all on board. Here, as in the western voyage of Nicolò Zeno, the presence of a volcano appears to indicate Iceland, but the adventurer had no intercourse with the inhabitants, who are described as living in huts of stone, and inhabiting caves. Here Zichmni resolved to winter, and Antonio was sent to Friesland with some mutineers who refused to remain. A voyage of twenty days in an easterly and eight in a southerly course brought him to Friesland. The only indication in this voyage that aids us in conjecturing the places named is the volcano, which points to Iceland. If we assume Iceland to be its western termination, there is nothing in the narrative incompatible with the assumption that Friesland was the point of departure; and the bearings and the time occupied, as far as they are given, rather favour this view.

Confining ourselves to the narrative of Nicolò Zeno the younger, leaving out of view all that has been written by controversialists on the subject, we have found nothing inconsistent with the idea that the Friesland of the elder Nicolò may have been the Friesland generally known by that name, except that it is called an island; and considering that the Zeni appear to have been acquainted only with a limited portion of its shores, there is nothing extraordinary in their having taken it for an island. We have paid no attention to the map published along with the narrative of the younger Nicolò, for two reasons: in the first place, it is impossible to look at it without feeling convinced that its projection could not have been made so early as the time of the Zeni; in the second place, it is in parts inconsistent with the narrative. In his first campaign Nicolò Zeno is expressly said to have sailed first from east to west, and then from west to east; according to the map he must have sailed from north to south, and from south to north. There seems little doubt that the map is the compilation of some later cosmographer.

If we may assume Friesland to have been the country between the Zuyder Zee and the Ems, the Estland between it and Norway would naturally appear to indicate the more easterly Danish peninsula; "le islande," the different island groups north of Scotland, of which Bressay alone seems recognisable; and the Engroneland of Nicolò, and the nameless island of Antonio Zeno, each with its volcano, Iceland. In corroboration of this view may be recalled—first, the time and bearings of Antonio Zeno's voyage from the island to Friesland; second, the Scotch colony in the first island reached by Zichmni; third, the resort of vessels to Friesland from France, England, and the Netherlands for fish; fourth, the commercial intercourse between Engroneland and

Digitized by Google

Norway—specially it would appear with Drontheim. The state of Friesland towards the end of the 14th century affords an additional corroboration: it was a rude country, intermediate between the Hans towns and the trading towns of the Netherlands, where the 'strandrecht' (privilege of wreckers) was in full force, and where pirates found shelter and purchasers of their plunder. Zeno's account of Zichmni conveys the idea of the chief of a band of rovers who wrested a small island near Friesland from the king of Norway, and thence made piratical excursions in every direction. Zeno's narrative would lead to the inference that his band were but indifferent seamen, and previously unacquainted with the countries they visited.

This view of the scene of the Zeni's wanderings is not put forth as certain: the materials do not admit of certainty. If it is not tenable, where is Friesland to be found? Some later writers have felt so strongly the impossibility of answering this question, that they have been obliged to assume that Friesland has since been submerged in the sea. Their difficulties appear to have arisen from the predetermination of earlier writers to convey the Zeni as far west as Greenland. Walckenaer, seeing the impossibility of this, has fixed the most westerly terminus of their voyages on the south-east of Iceland, to which he may have been led by the striking coincidence of the coast of Engroneland on the map of Nicolò Zeno the younger, and the south-east coast of Iceland. Walckenaer however seeks for the Friesland of the Zeni in the northern parts of Iceland. The data are too scanty to warrant any approach to dogmatism on the subject, but on the whole we incline to adhere to the conclusions we have arrived at: first, because we see no impossibility in the Frisland of the Zeni being the country generally so called; second, because the relative positions and distances of the different places and the state of society appear to correspond with that assumption.

The other members of the Zena family who appear to require notice we will take in chronological order.

CARLO ZENO, grand-admiral of Venice, brother of Nicolò and Antonio, was born about 1334. While yet quite a child the pope presented him to a prebendal benefice at Patras. At the University of Padua, some debts he contracted at play obliged him to abscond, and for five years he served as a soldier in different parts of Italy. Returning home, he found the republic engaged in a war with the Turks, and repaired to Patras for the double purpose of taking possession of his benefice and serving his country in a military capacity. In Greece he got involved in a duel, and this forced him at last to resign all views to an ecclesiastical career. He married a rich Greek widow, who however did not long survive their marriage. On his return to Venice he took for his second wife a lady of the Giustiniani family. Unable to remain at rest, he repaired to Constantinople in prosecution of commercial speculations, which kept him seven years engaged. His transactions brought him into connection with the emperor John Palæologus, and enabled him to bring to a conclusion the negociation by which that prince ceded Tenedos to the Venetians. This occurred in 1376, and is the first event in the life of Zeno of which we have been able to ascertain the date so nearly. This acquisition on the part of the republic was the commencement of the war of Chioggia, in which the Genoese, the Hungarians, and the Lord of Padua were leagued against Venice. The defence of Treviso against the Hungarians was intrusted to Carlo Zeno. He maintained that frontier post till 1379, when the Venetian government, after the loss of the sea-fight of Pola, recalled him to take the command of a fleet. With eight galleys he sailed from Venice, and broke through the Genoese fleet without losing a vessel. He took a number of the enemy's ships in the Sicilian waters, and negociated a peace with Joan of Naples. He then sailed northward, and made the victorious Genoese tremble for the security of their own coasts. After scouring the north-eastern shores of Italy he set sail for the Archipelago, where he received reinforcements. With his fleet augmented to fourteen galleys he steered to Beirout to offer convoy to the stores of Venetian merchandise which had accumulated during the war. He appeared with his rich fleet at the mouth of the lagoons on the 1st of January 1380. Venice was at that moment reduced to the last extremity. The Genoese had taken Chioggia and penetrated into the lagoons with a fleet of double the number of vessels that the grand-admiral Pisani had to oppose to them. The arrival of Zeno completely changed the face of affairs. He broke the Genoese blockade, provisioned Venice, and transferring his services from the sea to the land force, re-took Chioggia.

On the death of Pisani (15th August 1380), Zeno was appointed grand-admiral, and in that capacity he made head against Spinola in the Archipelago till the peace of 1381. The next five years were spent by Zeno in Lombardy in the service of the Visconti. After this he was employed on embassies to France and England, and advanced in succession to the dignified magistracies of Avogador delle Commune and Procurator of St. Mark. In 1403, while still holding the latter appointment, he was, contrary to the customary policy of Venice, placed in command of a fleet to oppose Boucicault, over whom he obtained a victory on the 7th of October. A few months later he was sent to command the army against Francesco Carrara, lord of Padua. Upon the death of Carrara and the sack of his palace, an entry was found in his registers of 400 golden ducats paid to Carlo Zeno. Zeno proved satisfactorily before the Council of Ten that this was simply the repayment of a debt which Carrara had contracted to him on the occasion of his flight to Ostia; but he was nevertheless deprived of all his employments and condemned to two years' imprisonment. As soon as he was set at liberty, Zeno embarked on a pilgrimage to the Holy Land. While there he entered into the service of the king of Cyprus, who was at war with the Genoese. In 1410, Carlo Zeno returned to Venice, and married for the third time. His remaining years were spent in literary pursuits, but tormented by the stone and the gout. He died on the 8th of March 1418. Of three sons whom he had by his second wife, two died before him. The family was kept up by the survivor, Pietro.

IACOPO ZENO, a grandson of Carlo, was a posthumous son of Iacopo, who died the year before his father. He was born in December 1417. He studied at Padua, and, after taking his degrees, repaired to Florence in 1439, during the sitting of the Council of Florence, and was soon received into the papal service. In 1441 he was apostolical referendary; in 1456 (or 1447, according to Ughelli) he was made bishop of Belluno and Feltro; in 1459 he was promoted to the see of Padua, where he died of apoplexy in 1481. Iacopo Zeno was esteemed one of the first orators of his age. He left a valuable library and several works of his own composition in manuscript. The most important were—1, 'Vita summorum Pontificum,' preserved in the Ambrosian Library, of which the Bollandists have made great use; 2, 'De Vita, Moribus, Rebusque gestis Caroli Zeni'—a life of his grandfather, of which an indifferent Italian translation by Francesco Querini has been repeatedly published. The original Latin appeared for the first time in vol. xix. of Muratori's collection of Italian historians.

CATERINO ZENO, a grandson of the traveller Antonio and the son of his son Pietro, surnamed 'Il Dragone.' Pietro was married to Anne Morosini in 1406, but the year of his son's birth is unknown: so is the year of his death. In 1472 Caterino Zeno was appointed by the senate of Venice ambassador to Uzun-Hassan-Beg, king of Persia. He is said to have accepted the mission with the more readiness, that having married a relative of David Comnenus, the last emperor of Trebizond, he was allied by marriage to the King of Persia. At Tabriz, the residence of Uzun-Hassan, Zeno was (probably on account of his matrimonial alliance) received at court on a more familiar footing than the generality of Europeans. This enabled him to collect a mass of interesting information relative to the manners and politics of the time. The insight thus obtained into Oriental courts he subsequently increased by journeys in Persia and Arabia. After the termination of his mission he published at Venice a short account of his travels. He subsequently returned to the east, and died at Damascus. The narrative of Caterino Zeno's travels became in little more than sixty years after his death so much forgotten that neither Ramusio nor his own kinsman Nicolò Zeno the younger was able to procure a copy of them. The latter endeavoured to supply the deficiency by compiling an account of Caterino's travels from letters written by him to friends during his residence in the east. Even this work has become extremely rare. Formaleoni published at Venice, in 1783, an account of Caterino Zeno's adventures, which he pretended to have taken from an ancient manuscript. This work is a gross and rather clumsy forgery.

NICOLÒ ZENO the younger (a descendant in the direct line of Nicolò Zeno the elder), to whom we are indebted for the only notices we possess of the adventures of 'the Zeni,' and of Caterino Zeno, was born in Venice on the 6th of June 1515, and died on the 10th of August 1565. He was a member of the Council of Ten. His contemporaries Patrizi (a contemporary), and Gaspari (in his 'Catalogo della Biblioteca Veneta') speak in the highest terms of his eloquence, and of his acquirements in mathematics and cosmography. He published 'Dell' Origine di Venezia ed antiquissima Memoria de' Barbari.' But he is principally remembered chiefly for the little volume, published in 1558, containing the adventures of Caterino Zeno, in two books, and those of 'the Zeni' in one book. This work has every internal mark of being a faithful compilation from the very imperfect materials in his possession. He leaves his heroes as much as possible to tell their own story.

ANTONIO ZENO the younger, a respectable Greek scholar of the 16th century, also belonged to the family of the Zena. He published at Venice, in 1569, a commentary on the speeches attributed to Pericles in Thucydides, and Lepidus in Sallust—'Commentaria in Concionem Pericles et Lepidi, ex Thucydide et Sallustio.'

APOSTOLO ZENO was born at Venice, on the 11th of December 1668. He was descended from a branch of the Zena family which had been settled ever since the 13th century in the island of Candia, whence the parents of Zeno were obliged to emigrate and return to Venice owing to the Turkish invasion, by which they lost all their property. Zeno's mother was of a distinguished Greek family of Candia. Zeno lost his father when a child, and his mother was thrown for support on the assistance of her brother-in-law, the Bishop of Capo d'Istria, who placed young Apostolo in the college of the Somaschi at Venice. He displayed early a decided taste for poetry, and after having left college he began to write melodramas, which were well received. One of them, entitled 'Temistocle,' so pleased the Emperor Leopold I. of Germany that he proposed to Zeno the situation of dramatic composer at Vienna, with a salary of 4000 florins, which Zeno declined. He received orders for melodramas from several courts of Germany and Italy, and was handsomely rewarded for them. Since the time of

Digitized by Google

Rinuccini, who may be said to have created the Italian melodrama, that species of dramatic composition had partaken of the vicious taste of the seicentisti, or 17th century school. Apostolo Zeno was the reformer and renovator of the genuine melodrama as a poetical composition, in which he was followed by his successor Metastasio, and afterwards by Segrafi, Barbieri, Romani, and others.

Zeno, in the midst of his poetical occupations, did not neglect graver studies. He was possessed of sound critical discernment, and had collected an ample store of literary knowledge. In 1710 he began to publish his 'Giornale del Letterati,' which was afterwards continued by his brother Pier Caterino Zeno, making altogether a series of forty volumes, full of important literary and biographical information. Having noticed many omissions and inaccuracies in the work 'De Historicis Latinis' of G. J. Voss, especially concerning the Italian historians who had written in Latin, Zeno undertook to supply the deficiency by his 'Dissertazioni Vossiane,' which were scattered about his Journal; they were collected and published after his death, in 2 vols. 4to, 1752, a work which is much valued. He likewise wrote a running commentary to the 'Biblioteca dell' Eloquenza Italiana' of Fontanini, which commentary is much more important and instructive than the text; it is written with much critical skill, and in somewhat a sarcastic vein. It was published also after Zeno's death, together with Fontanini's text, in 2 vols. 4to.

In 1717 Zeno was invited to Vienna by the Emperor Charles VI., with the offer of the situation of court poet, to which was afterwards added that of historiographer to his imperial majesty, accompanied with liberal emoluments. Zeno, having obtained leave of the state inquisitors, accepted the offer, and proceeded to Vienna in 1718. In crossing the Alps his coach was upset, and he broke his leg; but having recovered from the accident, he arrived at Vienna, where he was received by Charles in the kindest manner. He wrote dramas for the imperial opera, and oratorios for the imperial chapel till 1729, when his advanced years and the state of his health made him desirous of returning to Italy to end his days in his native country. Having obtained the consent of the emperor, and proposed young Metastasio to succeed him in his office of court poet, he returned to Venice, where he occupied himself in collecting books and medals, and in preparing his works for the press. The death of the Emperor Charles VI., and the wars of the Austrian Succession which followed, deprived Zeno of the liberal emolument which he had continued to enjoy even after he left Vienna; but the Empress Maria Theresa soon after granted him an annual pension of 1000 florins, with the continuation of the title of poet and historiographer to the imperial court. In 1747 Zeno sold his cabinet of medals for 20,000 florins to the abbot of the Regular Canons of St. Florian in Upper Austria. His rich library he bequeathed by will to the convent of the Dominicans of Le Zattere, near Venice, whence the greater part has been since transferred to the library of St. Mark. Zeno died in November 1750, being then eighty-two years of age.

Besides the works already mentioned, Zeno wrote also—1, 'Mappamondo Istorico, Continuazione dell' Opera del P. Foresti,' 4 vols. 4to, Venice, 1702–3; 2, 'Vita di Paolo Paruta;' 3, 'Note alla Vita del Cardinal Bembo;' three very biographical works, as well as a Life of Sabellico in Latin, also by Zeno, are inserted in the collection of the historians of Venice, for which Zeno wrote also a 'Prefazione,' or introductory discourse; 4, 'Memoria Istoriche della Famiglia e Vita di Enrico Caterio Davila,' prefixed to the edition of Davila's 'Storia di Francia,' Venice, 1733; 5, 'Compendio della Storia della Repubblica di Venezia;' 6, 'Vita di Giambatista Guarino;' 7, 'Vita di G. G. Trissino;' 8, 'Notizie Letterarie intorno ai Manuzii, Stampatori, e alla loro Famiglia,' prefixed to the Italian translation of Cicero's Epistles by Aldo Manuzio, published at Venice in 1726; 9, 'Note e giunte alla Vita del Guicciardini scritta del Manni,' prefixed to the edition of Guicciardini, in 2 vols. fol., Venice, 1738. Zeno's dramas have been published in 10 vols. 8vo, Venice, 1744. A selection of his letters was published in 3 vols. 8vo, 1752; but a more ample selection has been made by Morelli, in 6 vols. 8vo, Venice, 1785. Zeno left many other works unfinished or unpublished.

(Cornieni, *I Secoli della Letteratura Italiana;* Tipaldi, *Biografia degli Illustri Italiani;* Lombardi, *Storia della Letteratura Italiana nel Secolo XVIII.*)

PIETRO CATERINO ZENO, elder brother of Apostolo, was born on the 20th of July 1666. He took the monastic vows in his twenty-second year, and was soon after appointed to teach rhetoric in his order's seminary at Murano; thence he was promoted to the chair of philosophy at Venice. When Apostolo quitted Venice, in 1718, he confided the task of editing the 'Giornale de' Letterati' to his brother, who continued to discharge it till 1728, when he was obliged to resign on account of ill health. He died on the 17th of June 1732, worn out by the excessive rigour with which he performed his devotional exercises. Besides his contributions to the 'Giornale de' Letterati,' Pietro Caterino Zeno published a translation of Arnould's Logic, and translations of some of Bourdaloue's Sermons. He likewise published anonymously remarks on the poetry of Della Casa, and contributed the biographies of Baptista Nani and Michele Foscari to his brother's 'Lives of Venetian Historians.'

ZENO (Ζήνων), of Elea in Italy, was a pupil of Parmenides. According to the vague expression (ἠκμαζε) used by Diogenes Laertius, he was enjoying his greatest celebrity about B.C. 464. He visited Athens in company with Parmenides, and they were present at the Great Panathenæa. Parmenides is described by Plato as at this time a man advanced in years, with his hair quite white, but of a handsome and pleasing person: he was then about sixty-five years of age. Zeno, who was then near forty, is spoken of as a tall and comely personage. If we place this visit to Athens, with Clinton, in B.C. 454, in the fifteenth year of Socrates, Zeno who was born about B.C. 494. The authority for the visit to Athens is the 'Parmenides' of Plato, which, so far as relates to this historical fact, is generally admitted to be sufficient authority.

Strabo is of opinion that Zeno, as well as Parmenides, was employed in legislating for Elea. He probably lived till the commencement of the Peloponnesian War, or at least to B.C. 435. According to Plutarch ('Pericles,' 4) he was one of the masters of Pericles. The circumstances of his death are reported with much diversity. He is said to have conspired against a tyrant of Elea, who is variously named, and, on the discovery of the conspiracy, to have been put to death in a cruel manner.

Many works were attributed to Zeno, which, says Diogenes, were full of wisdom. One of his great works he is said to have read at Athens, on which occasion Socrates was present. Though the 'Parmenides' of Plato, which is the authority for this reading at Athens, cannot be taken to be literally true in all respects—for Socrates, then a very young man, is represented as discoursing with Zeno—yet there seems no reason to doubt the fact of Zeno having read his work at Athens. The object of this work, which was divided into several parts, was to show that it is impossible to conceive things as being Many, and this conclusion was derived as a necessary consequence from the supposition of things being Many; for Zeno showed that if we suppose things to be Many, then the same things are both like and unlike. Now, it is impossible that the same things can be both like and unlike, and therefore it is impossible to conceive things to be Many (οὐκοῦν εἰ ἀδύνατον τὰ τε ἀνόμοια ὅμοια εἶναι καὶ τὰ ὅμοια ἀνόμοια, ἀδύνατον δὴ καὶ πολλὰ εἶναι. Plato, 'Parmenides'). Zeno is said to have been the first who used the form of the dialogue in his philosophical discussions. His object was to maintain the doctrines of Parmenides, for he is said to have added little of his own to what his master did. His method was, to assume the truth of received opinions, and then to show the contradictions to which they lead, and, accordingly, Aristotle (as quoted by Diogenes) calls him the inventor of Dialectic; not of Logic, as some modern writers have it.

Zeno's work in defence of the Doctrine of the One was, as Plato makes him describe it, designed to support the opinion of Parmenides against those who ridiculed it on the ground that if there is only One, many absurd and inconsistent consequences would flow from the doctrine; and, accordingly, his work is in opposition to those who say that things are Many, and it has for its special object to show, that many more absurd consequences will flow from their hypothesis of things being Many, than from the hypothesis of the One, if a man rightly follow them up. This is the key to the explanation of what we know of the arguments of Zeno.

Zeno asked Protagoras if a single grain of millet, or the ten-thousandth part of a grain, would make a noise in falling. Protagoras said it would not. He then asked if a medimnus of such grains would make a noise in falling; and the answer was, Yes. Zeno further asked if there was not a ratio between the medimnus of grain and a single grain, or the ten-thousandth part of a single grain. Protagoras admitted that there was. "Will there not, then," said Zeno, "be the same ratio between the noise of the medimnus and of the single grain, as there is between the medimnus and the single grain? and consequently a single grain, or the ten-thousandth part of a grain, will make a noise in falling." There is nothing peculiarly subtle in this argument. If merely viewed as an instance that the senses do not always lead to a safe conclusion, it is well enough for that purpose.

Other arguments go deeper, and show more clearly the contradictions that arise from the notion of Many. Zeno, it is said, seemed to annihilate the notion of space, for his argument was this:—If there is space, it is in something, for everything that is, is in something; but that which is in something, is also in space. Space, then, must also be in space, and so on infinitely: therefore there is no space.

Again: he proves that if things are many, they are both finite in number and infinite; and he proceeds thus:—If things are many, they must be as many as they are, neither more nor less, they must, therefore, be finite. On the other hand, if they are many, they must be infinite; for there are always other things between things, and again, other things between these things, and consequently things are infinite. In the latter part he evidently considers the space between things as things, for things must have spaces between them; and these spaces he considers as things, or the equivalents of magnitudes, and as capable of endless subdivision.

Digitized by Google

Another argument is to this effect:—If a thing exists, it must have magnitude; for we cannot imagine a thing as existing which will not increase another thing by being added to it, or diminish another thing if taken from it. Now, if a thing has magnitude, it is capable of infinite subdivision; therefore, if things are many, they must be both small and great—small so as to have no magnitude, and great so as to be infinite. This is the literal version of Simplicius, which seems to mean, that infinite division of a thing implies an infinite number of corpuscles; and in this view a body is infinitely great, but the corpuscles are infinitely small.

Zeno has four arguments against motion. The first argument is this:—If a certain space is to be passed over, the half must be passed over before the whole space, and the half of that half before the whole of it, and so on in infinitum. There is therefore an infinite number of spaces to be passed over; and if the whole is passed over in a limited time, then an infinite number of spaces will be passed over in a finite time, which is impossible. Bayle calls Aristotle's solution of the difficulty 'pitiable.' Aristotle's solution is this, as explained by the 'Commentarii Coninhricenses':—That which is infinite in division, inasmuch as it is not infinite in act but in capacity only (non actu sed potestate), may be passed over in a finite time; for since time is continuous, and in like manner infinite, the time and the space will correspond in the same law of infinity, and in the same division of parts. It is easy to show that this is no solution.

Another argument is the Achilles, as it is called, which is akin to the last. Achilles runs a race with a tortoise, which has a certain start, but Achilles, though swift, can never overtake the tortoise, which is slow. For when Achilles has reached the point from which the tortoise started, the latter has advanced a certain distance; and this will always be the case: therefore Achilles can never overtake the tortoise. On this Ritter observes:—"We cannot suppose that Zeno, who in his proofs always maintained the infinite divisibility of space, should not also have considered the infinite divisibility of every portion of time; and yet the fallacy of the argument consists entirely in neglecting this consideration." But Zeno only admitted the infinite divisibility of space in order to show the consequences of the hypothesis. What Ritter says is no solution. We may take the fingers of the clock for Achilles and the tortoise, and assume that there is no other measure of time; and we will suppose the long finger to be at twelve, when the short finger is at one, and Zeno's argument is the same still. The difficulty lies in the idea of motion, of which Zeno gives another instance in a third argument against motion. An arrow when it moves through the air is at every moment in a space equal to itself, and therefore is at rest, for nothing moves in the space in which it is: but that which does not move is at rest, for everything either moves or is at rest. Therefore the arrow which moves, while it moves is at rest. Aristotle replies that this argument is false, for it supposes that time is composed of indivisible instants, which, he adds, that time is not composed of indivisible parts, nor is anything else composed of such parts. But this is not an answer, for time may be excluded from the consideration. The arrow is supposed by those who admit motion, to pass from one point in space to another. But in every position between these two points it is, as Zeno says, where it is; and when a thing is where it is, we conceive it to be at rest, and we cannot conceive otherwise. Bayle, who seems not to approve of Aristotle's solution, offers one which is no better. Zeno's difficulty remains. There is no absolute motion: we only conceive motion relatively.

There is a fourth argument, which is well stated by Bayle.

If we view the arguments of Zeno as mere sophisms, we view them wrongly. They touch the fundamental difficulties of all science, and Aristotle admits that their solution is not easy ('Topic.' viii. 8.) His arguments were directed to show the difficulties inherent in all our abstract notions. When, as Aristotle says, he denied motion and said that the space of a stadium could not be passed over, we need not suppose that he denied the phenomenon of a stadium being passed over by him who seemed to pass over it. He would not deny that there was the appearance of a stadium being passed over, but he denied that we could conceive how it was passed over, or that we could conceive absolutely any amount of motion. There is no authority for saying that he denied the existence of the One, even if he denied the existence of individual things. He did not admit that the true nature of the One could be known, for he said that if any person would show him what the One is, he would be able to tell him what things are (τὰ ὄντα). His speculations all point to the difficulty of determining the notion of individual things, and to the consequent conclusion of all things being One, without parts, an absolute, immeasurable, inconceivable Existence. Nothing particular is said of his theological doctrines, and the few physical doctrines that are attributed to him are not worth mentioning.

'Zeno,' by Victor Cousin, *and the reference there*; Kant, *Kritik, &c.*, *Die Antinomie der Reinen Vernunft.*)

ZENO of Citium, a small town in the island of Cyprus, was the founder of the sect of the Stoics. The time of his birth cannot be accurately ascertained, nor the dates of the other events of his life. He was however a contemporary of Antigonus Gonatas, king of Macedonia, and died before him. Antigonus Gonatus died B.C. 240. Clinton places the birth of Zeno between B.C. 357 and 352, and his death either in B.C. 263, or in B.C. 259 according to Diogenes Laertius. His father was a merchant, and Zeno when young followed his father's business. It is said that his father, on returning from one of his voyages, brought home some of the writings of the followers of Socrates, and that the perusal of them determined Zeno to the study of philosophy. It is not certain what his age was when he came to Athens: some accounts make him to have been thirty years of age, but his disciple Persæus says he was only so and twenty. He taught at Athens for fifty-eight years, and he lived to the age of ninety-two, or, according to other accounts, to the age of ninety-eight. In a letter addressed to King Antigonus, which is preserved by Diogenes Laertius, Zeno says that he is then eighty years of age, and he alleges this as a reason for not being able to visit the king according to his invitation; but he sent to him his disciples, Persæus and Philonides.

When Zeno first arrived at Athens, he became the pupil of Crates the Cynic, and this will account for his doctrines having some relationship to those of the Cynic school. But Zeno's moral character was above the standard of the Cynics, and their meagre philosophy could not satisfy his intellectual desires. He subsequently attended the lectures of Stilpo and of Diogenes Cronus, who belonged to the Megaric school; but it is probable that he was not satisfied with them, for he ultimately came over to the Academy, and became a hearer of Polemo. Zeno's doctrines, so far as we know them, show traces of the various schools in which his philosophical character was formed. He was not an original thinker; he selected out of all that he considered that seemed to him the best for his purpose. It was accordingly objected to Zeno, that though he differed little from his predecessors, he still wished to found a school of his own; and it was further objected, that he made fewer changes in doctrines than in words. His pupils assembled in the painted colonnade (στοὰ) at Athens, whence they received the name of Stoics (Στωϊκοί); they were at first called Zenonians from the name of their master. A slight accident which happened to him on coming out of his school, determined Zeno to put an end to his life on the spot. His practice was, in accordance with his doctrines, characterised by the strictest integrity and morality: his austerity over all sensual gratifications was notorious. The story is told which, whether true or false, shows at least the estimation in which he was held: it is said that the Athenians entrusted the keys of their fortresses to his keeping.

The name of Zeno is more conspicuous as the founder of a school, which continued for several centuries, than for what he did himself, though his writings were numerous. A list of them is given by Diogenes; a very few fragments of them remain. His style is said to have been characterised by brevity and closeness of argumentation. It appears from the fragments that the Stoical doctrines, as established in the opinions and writings of his followers, cannot be considered to have been elaborated by Zeno, though, according to all testimony, he laid the foundation of that which was developed and extended by others. His successors in the Stoic school were as follow:—Cleanthes, Chrysippus, Zeno of Tarsus, Diogenes of Babylon, Antipater of Tarsus, Panætius of Rhodes, and Posidonius. According to Clinton, Posidonius came to Rome B.C. 51. Panætius was the friend of Scipio Africanus the Younger, Lælius, and other distinguished Romans, and he introduced the Stoical philosophy at Rome. The Stoical doctrines suited in many respects the Roman character, especially in the modified form in which they received them, and these doctrines were embraced by many distinguished persons. In the imperial period the chief writers who belonged to the sect were L. Annæus Seneca, Musonius Rufus, who lived to the time of Vespasian, and Epictetus, a native of Hierapolis in Phrygia, and the master of Arrian, the historian of Alexander. But the most illustrious of all the Roman Stoics was the emperor Marcus Aurelius, who in his own work, which is extant, has left his portrait painted to the life.

Zeno's doctrines were mainly directed to the moral part of philosophy, and he approached nearer to the Cynics than his followers. It appears from the fact of his disciples separating into different parties, that his system was either not completely developed or that it possessed too little originality to unite all his followers. Chrysippus is said to have been the person who gave to the Stoical system its full development and fixed its doctrines; accordingly there was a saying, "If there had been no Chrysippus, there would have been no Stoa." The Stoics made three divisions of philosophy, which Plutarch calls the Physical, Ethical, and Logical (λογικόν), of which our word Logical is not a translation. But other Stoics made different divisions. The triple division was made by Zeno himself, as Diodorus states in his Life of Zeno, in which he has collected all the Stoical doctrines. The Logical part of the Stoical system comprehended their metaphysics. They made a distinction between truth (ἀλήθεια) and true (ἀληθές): truth implied body (σῶμα): but true was without body, and was merely in opinion. They attributed to things an absolute existence in themselves. Their system so far as we can learn what it was, was obscure, and they were certainly not well agreed among themselves on their metaphysical doctrines. They cultivated logic, rhetoric, and grammar. In their Physical doctrines they assumed two first principles, the Active and the Passive: the Passive was Matter (οὐσία).

Digitized by Google

the first substance of which all things were made; the Active was God, who was one, though called by many names. The universal belief in a deity, or in many deities, they considered one of the evidences of God's existence. All the universe, says Seneca, according to our Stoical doctrines, consists of two things, Cause and Matter. The Cause which puts matter in motion is conceived as pervading it, but it is Rational; the motions produced are not the effect of chance, and all the harmony and beauty of the visible world are a proof of design. It followed from their general doctrine that the Soul (ψυχὴ) is corporeal, for they defined all things to be Body which produce anything or are produced. They argued thus: nothing that is without body sympathises with body, nor does body sympathise with that which is not body; but only body with body. The body which is the soul sympathises, for we see both bodies. Death is the separation of the soul and the body. The Soul is a spirit (πνεῦμα) that is born with us; consequently it is body, and it continues after death; still it is perishable: but the Soul of all things, of which the souls of animals are parts, is imperishable. As to the duration of the soul, there were different opinions; Cleanthes thought that all souls lasted to the general conflagration; Chrysippus thought the souls of the wise only lasted so long.

The Ethical doctrines of the Stoics have attracted most attention, as exhibited in the lives of distinguished Greeks and Romans. To live according to nature was the basis of their Ethical system; but by this it was not meant that a man should follow his own particular nature; he must make his life conformable to the nature of the whole of things. This principle is the foundation of all morality; and it follows that morality is connected with philosophy. To know what is in relation to the whole of things, is to know what we ought to be and to do. This fundamental principle of the Stoics is indisputable, but its application is not always easy, nor did they all agree in their exposition of it. Some things were good, some bad, and some indifferent: the only good things were prudence, justice, and temperance, and the like. The truly wise man possesses all knowledge; he is perfect and sufficient in himself; he despises all that subjects to its power the rest of mankind; he feels pain, but he is not conquered by it. But the morality of the Stoics, at least in the later periods, though it rested on a basis apparently so sound, permitted the wise man to do nearly everything that he liked. Such a system, it has been well observed, might do for the imaginary wise man of the Stoics; but it was not a system whose general adoption was compatible with the existence of any actual society.

The subject of the Stoical sect is one of great extent. The Stoics, or the so-called Stoics, formed a sect that continued for four centuries, in which time the doctrines were subject to so much change that we often see little besides the name in which the professors of that sect agreed. Most of the works of the Stoical writers are lost. Two of them whose works remain, Epictetus and the emperor Marcus Aurelius, if not the most genuine specimens of the Stoic school, are certainly two of the most worthy.

(Diogenes Laertius, *Zeno*; Ritter and Preller, *Historia Philosoph. Graeco-Romanæ.*; Aurelius; Epictetus; and other articles in this work.)

ZENO (Ζήνων), emperor of the East, succeeded, in A.D. 474, the emperor Leo I. Thrax, or more correctly his own son Leo II., the younger, as will appear below. Zeno was the son of Rusumbladeus, or Rousomhladeusa, a noble Isaurian, and his original name was either Ariomesius, or perhaps Taraciocodisus or Taradiacodisus, or more probably Trascalisseus. We know nothing about his earlier life, of which however detailed accounts were probably given in the works of Eustathius of Syria, which are lost, and those of Candidus, of which only some fragments are extant. We must suppose that he was a man of great influence, especially among his warlike countrymen the Isaurians, and well known at the court of Constantinople, for in A.D. 468 the emperor Leo Thrax gave him his daughter Ariadne in marriage, evidently for the purpose of securing his influence among the Isaurians, whose assistance he wanted against the ambitious schemes of his prime minister Aspar.

On that occasion the son of Rusumbladeus adopted the Greek name of Zeno, and was created by the emperor Patricius, and appointed commander of the imperial life-guard and commander-in-chief of the Greek army in Asia Minor. In 469 Zeno was consul with Flavius Marcianus, and he assisted the emperor in getting rid of Aspar, who was put to death in 471. Leo, being old and childless, wished to appoint Zeno his successor, but the people disliked Zeno on account of his ugliness, a reason which may appear insufficient in our days, but which was important among the Eastern nations, who have always liked and still like to be ruled by handsome kings. Leo consequently gave up his plan, and chose Leo, the son of Zeno and Ariadne, for his successor, in 473. The emperor Leo Thrax died early in the following year, 474, and Leo the younger succeeded him under the regency of his father, upon whom the title of Augustus was perhaps conferred by Leo Thrax; it may be that Zeno assumed that title on his own authority, but neither of these opinions has been well established. Assisted by the empress-dowager Verina, and probably also by her daughter and his wife Ariadne, Zeno succeeded in gaining the affections of the people in some degree, and he consequently found no resistance when he contrived to be proclaimed emperor. His son, the young emperor Leo, put the imperial diadem on his head; but although Zeno became emperor, he was only the second in rank, as we may see in the laws issued by the two emperors, where Leo's name is always put before the name of his father: on some coins however the name Zeno stands before Leo. Leo died towards the end of the same year, 474. Zeno, and even his mother Ariadne, an excellent woman, have been accused of having poisoned their son, but this charge, as well as some other stories concerning the death of Leo, seem to be mere calumnies invented by orthodox ecclesiastical writers who found fault with the heterodoxy of Zeno.

Although Zeno met with no opposition in succeeding his son as sole emperor, he came to the throne under very difficult circumstances. Insecurity of power, from a great Isaurian family; was favoured by two brothers, Conon and Longinus, who were both enterprising, active, and ambitious; surrounded by many other Isaurians, who looked to him for honours and power; and revered by the warlike inhabitants of Isauria, who were not of Greek descent; he had to experience that the very circumstances which seemed to consolidate his strength, made his throne totter, and were so many causes of those rebellions and other public calamities by which his reign was marked as one of the most disastrous for the dignity and grandeur of the Eastern empire. When Zeno became emperor, the Isaurians came into power: hence arose jealousy among the Greeks, and dissatisfaction among those who had helped him to the throne; intrigue, revolts, rebellion, and civil war were the consequence, and this was followed by revenge, cruelty, and rapacity; general discontent and weakness in the government; arrogance and threats on the part of foreign barbarians, the conquest of Italy by the East-Goths, and the dissolution of the Western empire by Theodoric the Great. In short, the reign of Zeno was a crisis in the history of the East. As the details of this reign are far from being sufficiently clear, we shall only give a sketch of the most remarkable events.

Zeno was scarcely established on the throne when he lost it by a rebellion of Basiliscus, the brother of the empress-dowager Verina, both of whom conspired against the new emperor when they saw that their influence was checked by the increasing power of the brothers and other Isaurian friends of Zeno. The rebellion broke out suddenly (475) that Zeno fled to Isauria without making any resistance, and Basiliscus was proclaimed emperor. Zeno, being joined by Ariadne, prepared to oppose Illus, a general of Basiliscus, who advanced upon Isauria, and defeated Zeno, who retired into a castle called Limnatiopolis. Illus pressed the siege in it, when he was informed that there was great want of union among the adherents of Basiliscus, and that the people in general disliked the new emperor on account of his cowardly or treacherous conduct in the unfortunate expedition against the Vandals of Carthage, in 468. Upon this Illus proposed to Zeno to support him as usurper: the proposition was accepted with great joy, and Zeno and Illus marched to Constantinople. Near Nicæa they met with Armatius, or Harmacius, the nephew of Basiliscus, who offered no resistance to Zeno, by whom he was apparently bribed, and the usurper was soon besieged in Constantinople by Zeno. The city was taken by surprise, and Basiliscus was made prisoner, and starved to death in a tower in Cappadocia. Zeno was re-established, and in order to reward Harmacius, he made him commander-in-chief of the army, presented him with large estates, and conferred upon his son Basiliscus the younger the dignity of Cæsar, which was equivalent to making him his successor. It seems that Zeno did not act voluntarily in this affair, but that Harmacius demanded the Cæsarship for his son, as the prize of his defection from the usurper Basiliscus. Harmacius became so arrogant, that Zeno resolved to get rid of him. Assisted by Illus, he succeeded in seizing Harmacius, who was put to death, and his son Basiliscus was banished, after having been deprived of his dignity as Cæsar. Illus now acquired great influence over the emperor, which he soon abused, and he not only insulted the empress Ariadne, but conspired against her life. Illus, being deposed from his rank as prime minister, fled to Asia and revolted against Zeno; his fate is told below. During the time that Illus was in power several other rebellions broke out. Theodoric, surnamed Strabus, an adherent of Basiliscus, retired after the fall of the usurper into Thrace, collected a considerable force, and ravaged the environs of Constantinople. The emperor, unable to subdue him, bought peace from him, in 478; but Theodoric soon forgot his oath, united himself with Theoderic the Goth, who afterwards conquered Italy, and the emperor would perhaps have lost his throne but for the death of Theodoric Strabus, which took place in 481. Due to Theoderic the Goth, Zeno soothed his anger by creating him consul, and finally stimulated or allowed him to conquer Italy. [Theodoric the Great.] After peace had been concluded with Theoderic Strabus, in 478, another most dangerous revolt broke out under Marcian, the son of Anthemius, emperor of the West, and the grandson of the Emperor Marcian, who had married Leontia, the sister of the Empress Verina. Marcian intended to depose Zeno, and he took Constantinople by surprise, but he was surprised in his turn by Illus, and after a desperate fight fled for refuge to a church. He was taken out by force, his head was shaven, and he was banished to a monastery at Cesarea. But he escaped, caused fresh troubles, and was exiled to the castle of Papyrus in Isauria, or perhaps to Tarsus in Cilicia. The third great revolt was that of Illus, who, as already observed, had

Digitized by Google

insulted the Empress Ariadne, and escaped being put to death by flying to Asia, where he placed himself at the head of an army of 70,000 men. The patrician Leontius, who was sent by Zeno against Illus, betrayed the emperor and joined the rebel. Longinus, the brother of Zeno, took the field against both, but he was defeated, and probably made prisoner, for soon afterwards he was found in the camp of the rebels acting in concert with Illus and Leontius. The rebels then laid siege to the castle of Papyrus, where the Empress-dowager Verina was confined on account of her dangerous intrigues, and the castle having been taken, Verina also joined the rebels, and as they intended to put Leontius on the throne, she adorned him with the diadem, and he was received as emperor at Antioch, in 484. Zeno now despatched a fresh army against the rebels, which was commanded by John the Hunnish Scythian, not John the Sycthian, two generals who have often been confounded, but who were two different persons. They defeated the rebels in 488, who took refuge in the fortress of Papyrus, which the imperial generals hastened to surround with a superior force. At last the fortress capitulated; Illus and Leontius were made prisoners and put to death, and the empire was thus delivered from the greatest enemies of public order. Zeno died in the month of April 491, and his successor was an officer of the imperial palace guard (Silentiarii), Anastasius I., surnamed Silentiarius, who married Ariadne, the widow of Zeno. It is said that Zeno died under strange circumstances, but the account of his death are very contradictory. If we believe Zonaras and Cedrenus, Zeno was beheaded in his bed while asleep; or he died in consequence of a debauch; or was buried alive while insensible in a fit of apoplexy; and Ariadne was the author of his death. It happened here that some ecclesiastical writers, Theophanes, Evagrius, and Theodorus Lector, who make the worst of Zeno whenever they find an opportunity, do not mention a violent death, which, if true, would have served their purpose by throwing disgrace upon the memory of the emperor. The truth seems to be that Zeno died of apoplexy. Zeno's character was very unlike that of his predecessor Leo I. Thrax. but he was his inferior in every respect, in good as well as bad qualities: he was cruel, especially in the latter period of his reign, but less cruel than Leo; he was often overpowered by anger, but he never fell into such frightful fits of passion as Leo; he sometimes did favourable things for honour and glory, but less frequently and with less dignity and generosity. In short he was the shadow of Leo, without his energetic character, intelligence, and knowledge. Zeno did not understand the art of government; he was as vain as a woman, and his constant endeavours to be admired as something great made him ridiculous in the eyes of the witty Greeks.

ZENO'BIA (*Zenobia*, on the coins *Ζηνοβία*), SEPTIMIA, was the daughter of Amron, an Arab chief, who possessed the southern part of Mesopotamia. By her first husband Zenobia had a son named Athenodorus Wahalleth. Her second husband was Septimius Odenathus.

Odenathus was of Palmyra, a flourishing city included within the limits of the Roman empire, and dignified with the title of Metropolis Colonia. He was at the head of those tribes who belonged to that part of the Syrian desert which surrounds Palmyra. His Roman name, Septimius, indicates some connection with the empire, and it is ingeniously conjectured by St. Martin that the origin of this connection and of the adoption of the name Septimius by the family of Odenathus must be traced to the time of the emperor Septimius Severus. The name of the father of Odenathus was Septimius Airanes Waballath, and Odenathus had by his first wife a son named Septimius Orodes, or Herodes, as Trebellius Pollio calls him. Septimius Severus married Julia Domna, a Syrian woman of Emesa, and this circumstance, combined with his long residence in Syria, renders it probable that a connection was formed between the emperor Severus and the family of Odenathus, who, as usual in such cases, would adopt the name of their Roman patron. In A.D. 244, after the assassination of the younger Gordian, Philip, called the Arabian, was proclaimed emperor, and on leaving Syria for Rome he entrusted the government of Syria to his brother Priscus. The bad administration of Priscus caused a rebellion in Syria, and Jotapianus, a descendant of the royal house which had reigned at or possessed Emesa, was proclaimed emperor. Jotapianus was defeated by the imperial troops and lost his life, but Philip was assassinated before the news could reach him. Other usurpers arose in Syria, but Palmyra preserved its independence. In the year 251 Septimius Airanes was prince of Palmyra, and his son Odenathus was general. On the death of Airanes, Odenathus succeeded to the principality of Palmyra. The year of the death of Airanes is not certain, but it was before 256. In 256, Mariades, whom Trebellius Pollio calls Cyriades, left Antioch with a large sum of money, and betook himself to Sapor, king of Persia. He persuaded Sapor and Odenathus to an invasion of Syria, in which Antioch was taken. Mariades was proclaimed Caesar. He enjoyed his dignity for about a year, having been assassinated, according to Trebellius Pollio, while Valerian was on his march to the Persian war. It was Sapor's design to anticipate Valerian by invading Syria, but he was defeated near Emesa, and on his retreat he was annoyed and robbed by his old ally Odenathus. But after the surrender of Valerian to Sapor, Odenathus sent costly presents to the Persian king, in order to conciliate him: the presents were rejected with contempt, and Odenathus was commanded to come in person. The prince of Palmyra disregarded the command, and while the Roman troops were retreating on all sides in the confusion which followed the capture of Valerian, he alone opposed the progress of the Persian arms. The Persians had entered both Syria and Cilicia, and Sapor was at Antioch. Odenathus, at the head of the Arabs of the desert, and some few Romans who had joined him, attempted to cut off the retreat of Sapor, in which he was aided by Balista, the Roman general, who made a diversion in Cilicia. His wife Zenobia also accompanied him in this campaign. Sapor at last commenced his retreat; but at the passage of the Euphrates he sustained a defeat and lost much of his baggage. He was followed by Odenathus through Mesopotamia, again defeated, and pursued to Ctesiphon on the Tigris, his capital. If Odenathus besieged Ctesiphon, it appears that it was unsuccessfully.

About this time Odenathus assumed the kingly title, and it is probable that he was considered emperor of the East. Gallienus, the son of Valerian, who became emperor upon his father's capture, in 260, was too indolent to attempt to maintain his authority. The Roman army in Syria and Egypt proclaimed Macrianus emperor, who associated with himself in the empire his two sons, Quietus and Macrianus. Quietus was left in Syria. The new emperor marched through Asia, and advanced as far as Illyricum, where he was opposed by Aureolus, who had also risen against Gallienus, and totally defeated. Upon this Aureolus was received by Gallienus into partnership in the empire, and he forthwith marched to the East to crush the partisans of Macrianus. Odenathus, seeing what turn things had taken, entered Syria, upon which Balista, who had quarrelled with Quietus, murdered him and delivered up to Odenathus the town of Emesa, in which Quietus and Balista were then besieged. Odenathus made Balista associate himself emperor, but he was defeated by Odenathus and lost his life. About this time probably (A.D. 263) Odenathus was associated by Gallienus in the empire, and received the title of Augustus. A coin also was struck in his honour, on which were represented the Persians in fetters captive. Odenathus now undertook a second war against the Persians, to avenge the cause of Valerian: he made many prisoners, whom he sent to Gallienus, and the slothful emperor enjoyed a triumph which was earned by the bravery of another. Odenathus again besieged Ctesiphon, but without any result. On reaching Ctesiphon he marched into Cappadocia to oppose the Scythians, who were making that part of Asia Minor. Odenathus was assassinated at Emesa in Syria with his son Orodes, by a relation named Maeonius, in 267, but the conspirators were put to death by the soldiers of Odenathus, and his wife Zenobia succeeded to his power.

The events of the life of Odenathus are confusedly told, yet the main facts may probably be received as true. He was a brave and active soldier, and if he had lived longer he might perhaps have seated himself on the throne of the Roman Caesars. There are no medals of Odenathus. He left by Zenobia two sons, Herennius and Timolaus.

Zenobia, after the death of her husband, governed Palmyra till she was taken prison by Aurelian. It is said that she invested with the purple her son Waballath, or Athenodorus Waballath, and to him are attributed certain extant medals which bear the Greek legend of Athenodorus. The power of Zenobia extended from the Euphrates to the Mediterranean and the borders of Egypt. According to Zosimus, an army of Palmyrenes and Syrians under Zabdas, a general of Zenobia, invaded Egypt in the reign of Claudius, and got possession of the country. (Compare 'Claudius,' by Trebellius Pollio, c. 11.) Palmyra, in the Syrian desert, was her residence, a city seen in the centre of a great commerce, and which was adorned with magnificent buildings, the remains of which are still more striking from their contrast with the desolation around them. Zenobia maintained herself against Gallienus, and also during the reign of his successor Claudius, who was occupied with his Gothic wars; but the accession of Aurelian (A.D. 270) once more placed a soldier at the head of the empire. Zenobia was defeated by Aurelian, Palmyra was taken, and the Syrian queen appeared in chains in the triumph of the emperor, as an Egyptian queen, Arsinoe, once before had appeared in the triumphal procession of the dictator Caesar. [Aurelian.] Zosimus indeed says that she died on her way to Rome; but the narrative of Trebellius Pollio appears too particular to be false. He says that after the triumph Aurelian gave her a residence at Tibur, which went by the name of Zenobia at the time when Pollio wrote.

The habits and person of this warrior queen are described by Trebellius Pollio. She lived in great state, like the kings of Persia. When she harangued her soldiers she wore a helmet; her dress had a purple border with jewels hanging from the fringe; her waist was fastened round the waist with a clasp, and her arms were sometimes bare. Her complexion was rather dark, her eyes black and piercing; her teeth were as white as pearls, and her voice clear and like a man's. She knew when to be liberal, though her general character was frugal. She rarely rode in a chariot, but often on horseback. Sometimes she would march several miles on foot with her soldiers. Her habits were sober, but she would sometimes drink with her generals. Besides her native tongue, Syriac, she was well acquainted with Greek, and spoke

Digitized by Google

the Egyptian language to perfection. Her Greek secretary was Longinus. [LONGINUS.] Such was the woman whose ambition, it is said, led her to aspire to overthrow the Romae empire in the West. Her history is imperfectly koowo, but the main facts appear to be as well ascertained as other cootemporary events.

There are coins of Zenobia with the Greek inscription ΣΕΥΤ. Ζηνοβία Σεβ. (Septimia Zenobia Augusta); and one coin has Zenob. Aug. (Zenobia Augusta) in Roman characters. On the reverse of one of her coins is the inscription ΑΥΤ. Κ. Αυρηλιανος (Autocrator Caesar Aurelianus).

(*Zosimus*, i. 39-59; Zonaras, xii. 27; *Historiae Augustae Scriptores*; *Bung. Univ.*, art. 'Odenath,' by St.-Martio, and 'Zénobie;' Rasche, *Lexic. Rei Numariae*; Eckhel, *Doctrina Num. Vet.*, vii. 490, &c.)

ZENODO'TUS, a Greek sculptor, supposed by Thiersch to be a native of Massilia, from having first practised his art in Gaul, where he made an enormous colossal statue of Mercury, which occupied him ten years. He was called to Rome by Nero, in order to make a bronze statue of that emperor of far greater dimensions than any previous work. One account says it was 110 feet high, another 120. (Pliny, 'Hist. Nat.,' xxxiv. 18; Suet. 'Ner.,' 31.) This statue, which was set up in front of the Golden House, was afterwards re-dedicated as a statue of the Sun by Vespasian: its subsequent history is related by Thiersch ('Epochen,' 307, &c.). Zenodorus, though successful in casting his great brooze works, appears from the statement of Pliny to have been deficient in the finer and more refined technalities of the sculptor's art. Zenodorus seems to have been equally famed for his skill in silver chasing, and the sculpture of small works in metal, as for his colossal statues. The date of his death is not recorded.

ZENO'DOTUS (*Ζηνόδοτος*) of Ephesus, a celebrated Greek grammarian. According to Suidas and Eudocia, he was a pupil of the grammarian Philetas, and lived at Alexandria in the reign of Ptolemy, the son of Lagus, whom however he must have survived, as his most active period belongs to the reign of his successor Ptolemy Philadelphus, about B.C. 280. Zenodotus was the first chief librarian at Alexandria, and was succeeded in this office by Callimachus. He is also said to have instructed the sons of the first Ptolemy. With Zenodotus there begins a new era in the history of grammatical and critical studies, both of which he treated according to the principle of analogy. He was also the first Alexandrine critic who wrote editions (*διόρθωσεις*) of the Homeric poems, which is frequently referred to by Eustathius, the Venetian Scholia, and other grammarians. His edition of Homer and the later one of Aristarchus were held in the highest esteem by the ancients. This undertaking led him to a careful study of the Homeric language, and in comparison with that of later times. The signification of words and phrases appears to have much engaged his attention, and the fruits of his studies in this respect were deposited in his Glossary (*Γλῶσσαι*) and his dictionary of foreign or barbarous phrases (*λέξεις ἀλλοεθνεῖς*; Scholiast ad 'Apollon. Rhod.,' ii. 1005; ad 'Theocrit. Idyll.,' v. 2; Athenaeus, i. p. 3 d; iii. p. 73 f; iv. p. 171 b, p. 478; Galen, 'Glossar. Hippocrat.,' s. v. *τέρμι* and *τέλτα*). Athenaeus (x. p. 412, and iii., p. 96) mentions two other works of Zenodotus, one called '*Ἐκτορεία*,' and the other '*Ἱστορικὰ ἀνομνημονεύματα*, although these works may possibly belong to a later grammarian, Zenodotus, who lived after the time of Aristarchus, and censured his critic for his bold deslings with the Homeric poems. Suidas attributes to this latter Zenodotus several works, of which however nothing except the titles is known. (Fabricius, *Biblioth. Graec.*, i. p. 362, &c.; Wolf, *Prolegomena ad Hom.*, p. 199, &c.; Heffter, *De Zenodoto ejusque Studiis Homericis*, 4to. Brandenburg, 1839; Grüfenhan, *Geschichte der Philologie*, i., p. 388, &c., 330.)

ZEPHANI'AH, or SOPHONTAS, one of the twelve minor Hebrew prophets, was the son of Cushi, the son of Gedaliah, the son of Amariah, the son of Hizkiah, and prophesied in the reign of Josiah, the son of Judah (chap. i. 1). The period of that king's reign to which Zephaniah must be referred seems to be determined with tolerable exactness by the book itself, which describes the Jewish state as partially but not entirely reformed from the worship of Baal, and from other corruptions of religion (i. 3-6). Now, in the Second Book of Chronicles (xxxiii. 4-7) the reign of Josiah is divided into three periods: doring the first, which extended to the twelfth year of his reign, he tolerated idolatry; during the second, from the twelfth to the eighteenth year, he instituted a partial reformation; but in the eighteenth year he commenced a thorough restoration of the Mosaic institutions, in which he persovered till the end of his reign. It is evidently to the second of these periods, which extended from the year B.C. 630 to 624, that the prophecies of Zephaniah must be referred. This date is confirmed by the prophecy (ii. 13-15) of the destruction of Nineveh, fulfilled in the year B.C. 622. Zephaniah was contemporary with Jeremiah during the first part of Jeremiah's ministry.

The prophecy of Zephaniah is a prediction of the judgments about to fall on the Jews and other nations. The first chapter contains a prediction of the destruction of Jerusalem, the desolation of the land of Judah, and the captivity of the people. The second chapter opens with an exhortatioo to repentance, and then denounces the destruction of the Philistines, of Moab and Ammon, of Cush and Assyria, as the enemies of the people of God, with hints of the restoration of the Jews. The third chapter recounts the sins of Judah, and promises the restoration and prosperity of Israel and Judah.

The style of Zephaniah is poetical, "but there is nothing," says Bishop Lowth, "very striking or uncommon either in the arrangemeot of his matter or the complexioo of his style."

(E. F. C. Rosenmüller, *Scholia in Vet. Test., Procem in Zeph.*; the 'Introductions' of Eichhorn, Jahn, De Wette, and Horne.)

ZEPHYRI'NUS, a native of Rome, succeeded Victor I. as bishop of the Christian Congregation of that city, during the reign of the Emperor Septimius Severus. We have no authentic records of his life, nor of his alleged martyrdom. He died about A.D. 202, and was succeeded by Calixtus I.

ZEUXIS, one of the most celebrated painters of antiquity and the greatest of his time, was boro at one of the ancient cities named Heraclea, between B.C. 460 and B.C. 450. He was instructed by Demophilus of Himera or Nesesa of Thasos. Little or nothing is known about them. Pliny fixes the time of Zeuxis at B.C. 400; but he can scarcely have been born later than B.C. 450, as he was at the height of his reputation during the reign of Archelaus, king of Macedon, which was from B.C. 413 until B.C. 399; and Hardoin and others are therefore probably incorrect in fixing upon Heraclea in Lucania, in Italy, as the birth-place of Zeuxis; for that city was not founded until after the destruction of Siris, B.C. 433. (Diodorus Siculus, xiii., c. 6; Strabo, p. 264.) From the complaint of Apollodorus, who lived at Athens, Zeuxis must also have been early in that city; and he was most likely a native of one of the Heracleas in Greece, and, from his connection with Archelaus, probably Heraclea Lyncestis in Macedonia. Hardoin supposed Heraclea in Lucania to be the birth-place of Zeuxis, from the circumstance of his being commissioned to paiot a picture by the Crotoniats—a very insufficient reason. Zeuxis, when he had made himself rich by his profession, and must accordingly have been somewhat advanced in years, gave away some of his works, and, as was also the case with Pliny, for he presented a picture of the god Pan to that king. Zeuxis lived also some time at Ephesus, and Tzetzes, an indifferent authority, calls him a native of that place.

Lucian terms Zeuxis the greatest painter of his time: he was immediately succeeded by Apelles of Ephesus, Athens, whom he surpassed; and he was immediately followed by Parrhasius of Ephesus, who surpassed him. The peculiar excellence of Zeuxis is defined by many ancient writers: he drew well and in a grand style, and the beauty and grandeur of his forms were so great that it was said by Aristotle to have failed in expressing mind. Aristotle adds that he was in this respect much surpassed by Polygnotus of Thasos, who preceded him about half a century. Quintilian says that Zeuxis followed Homer, who loved powerful forms even in women; he likewise notices his excellence in light and shade. Cicero also speaks of the fine forms of Zeuxis. That he was excellent in light and shade and colour is evident from the complaint of Apollodorus, that Zeoxis had robbed him of his art: effective colooring and light and shade were the peculiar excellences of Apollodorus. With these excellences Zeuxis combined a dramatic effect: composition also he was distinguished also, according to Lucian, by a peculiar choice of subject; for he seldom or never, says Lucian, exerted his powers upon such vulgar or hackneyed subjects as gods, heroes, or battles; but he always selected something new and unattempted, and when he had chosen a subject he laboured his utmost to render it a masterpiece. Lucian instances, as an example, a picture of a family of Centaurs, of which he saw a copy at Athens, and which excited his wonder from its extraordinary excellence. The original was lost at sea on its passage to Rome, whither it was sent by Sulla. Lucian describes it as follows: "On a grass-plot of the most glossy verdure lies the Centauress, with the whole equine part of her stretched on the ground, the hind feet extending backwards, while the upper female part is gently raised and reclining on one elbow. But the fore feet are not equally extended, as if she lay on her side; yet one advances a little, and, bearing the hoof bent backward, whereas the other is lifted up and pawing the ground, as horses are wont to do when they are going to spring up. Of her two young, one she holds in her arms to give it the breast, the other lies under her sucking like a foal. On an elevation behind her is seen a Centaur, who appears to be her mate, but is only visible to the half of the horse; he looks down upon her with a complacent smile, holding up in one hand the whelp of a lion, as if jocosely to frighten his little ones with it. . . . In the male Centaur all is fierce and terrible: his shaggy mane-like hair, his rough beard, his broad and brawny shoulders, and the countenance, though smiling, yet wild and savage: in short, everything bears the character of these compound beings. The Centauress, on the other hand, as far as she is brutal, resembles the finest mare of the Thessalian breed which is yet untamed and has never been mounted; by the other part she is a woman of consummate beauty, excepting only in the ears, which have somewhat of the satyr shape. The blending however of the human and the animal natures is so artificial, and the transition of one to the other so imperceptible, or rather they so gently lose themselves in one another, that it is impossible to discern where the one ceases and the other begins. Nor in my mind was it less admirable that the newborn young ones, notwithstanding their teoder age, have somewhat wild and fierce in their aspect, and that mixture of infantine timidity and curiosity with which they look up at the whelp, while at the same time they continue eagerly sucking, and cling as close as they can to the mother" (Tooke's Translation). Pliny notices several pictures by

Digitized by Google

Zeuxis, but his most celebrated work was his Helen, which he painted for the city of Croton. It was in the painter's own opinion a perfect work, and he inscribed upon the pannel, according to Valerius Maximus, the three lines of Homer, thus rendered by Pope:—

> "No wonder such celestial charms
> For nine long years have set the world in arms!
> What winning graces! what majestic mien!
> She moves a goddess, and she looks a queen."
>
> Iliad, iii. 156-158.

This picture, for which, says Cicero, the citizens of Croton allowed Zeuxis to select five of their most beautiful virgins as his models, was dedicated in the temple of Juno Lacinia at Croton.

Ælian says that Zeuxis exhibited this picture at so much a head, and made a great deal of money by the exhibition, and that it acquired the name of The Prostitute in consequence. It was a very famous work in after-times, and painters apparently travelled to Croton to see it. Stobæus relates that the celebrated Nicomachus of Thebes, hearing some person remark that he perceived nothing extraordinary in the picture, observed—"Take my eyes, and you will see a goddess." There was in Pliny's time a picture of Heleo by Zeuxis, in the Portico of Philip at Rome. Probably a greater work by Zeuxis, though less celebrated than his Helen, was his picture which he presented to the Agrigentines, of the infant Hercules strangling the serpent sent by Juno to destroy him, in presence of his panic-struck mother Alcmena and of Amphitryon. Other famous works by him were—Jupiter in the midst of the assembly of the Gods; Penelope bewailing the absence of her husband; Menelaus mourning over the fate of Agamemnon; a Marsyas bound, in the temple of Concord at Rome in Pliny's time; an Athlete, under which he wrote the line—"It is easier to find fault than to imitate,"—which, according to Plutarch, Apelledorus wrote upon some of his pictures; and a Cupid crowned with roses, which was in the temple of Venus at Athens. This Cupid is noticed by Aristophanes in the comedy of the 'Acharnenses,' but the painter's name is not mentioned; it is however ascribed by the scholiast to Zeuxis. As this comedy was acted as early as the third year of the 88th Olympiad (B.C. 426), Sillig has concluded that it is an error of the scholiast to ascribe the picture in question to Zeuxis, as he cannot have painted it so early. But from what has been said above it is pretty evident that Zeuxis was a man of mature years in B.C. 426, and, as we have seen, he had amassed a fortune within twenty-seven years of this date, for he presented a picture of Eros to Archelaus, B.C. 399. Zeuxis had also a previously executed several works for Archelaus in his palace at Pella, for which the king, says Ælian, paid him 400 minæ, 1625*l*, according to Hussey: this, though a small sum compared with what was paid to some of the painters of the Alexandrine period and later, was probably at the time comparatively a large one. The time and place of Zeuxis's death are uoknown, bot, as Sillig has observed, he must have died, and probably some years, before the second year of the 106th Olympiad (B.C. 355), the year in which Isocrates delivered his oration περὶ Ἀντιδόσεως (on the exchange of property), in which he has praises Zeuxis, for, according to the Greek custom, he would not have done it had the painter been still living. Festus (sub voc. 'Pictor') relates, from Verrius, that he died through laughing excessively at the picture of an old woman which he had made, but this is probably a mere fiction: there is no other notice of such a disaster.

Zeuxis is represented as having been very proud of his reputation and ostentatious of his wealth; he used to wear a mantle with his name woven in letters of gold on the border. To balance this weakness there are two or three anecdotes of an opposite character, which show that he had no want of penetration. Plutarch relates a story, that upon an occasion when in his compaoy a painter of the name of Agatharchus boasted of the great facility and rapidity with which he painted, Zeuxis quietly remarked, that he took a long time to paint anything. And Ælian records how he reproved a certain Mnasilochus, a high priest of Diana at Ephesus, who during a visit to the painter conversed so very ignorantly about pictures, that some lads who were grinding colours were forced to laugh, upon which Zeuxis observed to him—"As long as you were silent, these boys were admiring you, wondering at your rich attire, and the number of your servants; but now that you have ventured to discourse about the arts, of which you have no knowledge, they are laughing at you." Plutarch relates this story of Apelles and Megabyzus, and Pliny relates it of Apelles and Alexander. Zeuxis, probably while at Ephesus, entered into a contest with Parrhasius; Zeuxis painted some grapes which are said to have deceived birds, but Parrhasius painted a curtain which deceived Zeuxis himself, who accordingly confessed himself beaten. Zeuxis also painted a boy carrying some grapes, which likewise deceived the birds, but in this instance, to the dissatisfaction of the painter, who observed, that if the boy had been as well painted as the grapes the birds would have feared to approach them. Though these stories in themselves are valueless, the fact that such stories should have been circulated in ancient times is of considerable interest, as it shows that the ancients believed that exact imitation could be accomplished in colours, a result they could only have arrived at by the evidence of their senses; yet they do not appear to have estimated such productions at more than their due value, which is evident from the fact that there is scarcely a passage in ancient authors in which mere beauty of execution and exact fidelity of imitation are praised, if we except one or two original expressions of Pliny, who is the least critical of all the ancient writers when speakiog of the arts.

Cicero states that Zeuxis used only four colours, but this is probably an error, or he may mean in his carnations, in which four are all that are necessary. The same writer makes also the following remark:—that the works of Zeuxis, of Aglaophon, and of Apelles are in different styles, yet they are all three perfect in their respective styles. Zeuxis painted also pictures in white or mere chiaroscuro, that is, in light and shade, as the Greeks termed monochroma (μονοχρώματα), that is, in one colour.

It is remarkable that Pausanias does not mention the name of Zeuxis, and we may infer from this that Zeuxis painted easel pictures only, or upon tabulæ, wooden pannels (*wissen*), which, from their perishable nature and facility of removal, are very easily lost. The more eminent a painter therefore, the greater is the risk that his works will perish, as they are better worth removal. Few of the great painters of Greece painted upon walls: Apelles never did, and there is reason to believe that the works of Polygnotus at Delphi were painted upon pannels, which were inserted in the walls; on this subject see Raoul Rochette, 'Sur l'Emploi de la Peinture,' &c.

ZHUKOVSKY, VASILY ANDREEVICH, a Russian poet of the first order of eminence, was born at the village of Mishensky, about two miles from the town of Bielev, in the government of Tula, on the 29th of January (O.S.) 1783. The year of his birth, which has often been differently stated, is given on his own authority as reported by Sueguirev. At a very early age he lost his father, and he was chiefly brought up by his mother, grandmother, and aunt, in a household which contained nine girls and three young women, and in which he was the only boy. At school he had at first the reputation of being lazy and very averse to dry studies, while at home his good looks and good nature made him a general favourite. He formed all the girls into a troop of actors, and at an early age got up a play of his own composition, 'Camillus, or Rome Preserved,' in which he acted the part of the hero with great applause from the neighbours who were invited to the performance. At the age of thirteen, on the subject being given him for a theme at school, he produced an exercise of such excellence that it has been considered as a classical piece in several Russian compilations of the nature of Enfield's 'Speaker.' At the age of fourteen he began to appear in print by contributing to one of the Moscow periodicals under the signature of the 'Recluse of the Mountain;' and at that period, while quite gay and lively in society, he was disposed in composition to be mild and meditative. His time appears to have been divided for some years between different towns in winter and his native village in summer; and after he left the schools of Tula and Moscow he gradually won his way into notice and distinction by proficiency in study. At the village of Mishensky, which was picturesquely situated on the banks of the Oka, he cultivated his talents for poetry, music, and drawing, for all of which he had a natural gift.

It was at a house within sight of the church and churchyard of Mishensky that he wrote his translation of Gray's 'Elegy in a Country Churchyard,' the first production of his pen which made an impression on the public. Gray's 'Elegy' is at this moment the most universally known and universally popular piece of poetry in existence. Bowring, in 1821, mentioned that he had seen a collection of more than one-hundred and fifty different versions, and among them Zhukovsky's is undoubtedly one of the best. This fortunate translation, which was published in 1802, was, like Moore's 'Anacreon,' the foundation of a fame which encircled its author for a succeeding half-century. It first appeared in the 'Vestnik Evropui,' or European Intelligencer, then the leadiog periodical of Russia, of which Karamzin, its most popular author, was at the time the editor, and it introduced him at once to the friendship of Karamsin and Dmitriev, and a position amid the best literary society of Moscow. Two years later, in 1808 and 1809, Zhukovsky became himself the editor of the same periodical, but he soon relinquished the employment, though he had now devoted himself to a literary career. In the war of 1812, both Karamzin and Zhukovsky were anxious to bear arms, but the bodily infirmities of Karamzin would not allow him to sit on horseback, and Zhukovsky took leave of him at Moscow at the house of Count Rostopchin, where he was residing, to hasten to the ranks of the army. As a lieutenant of the Moscow volunteers, Zhukovsky fought at the great battle of Borodino, and he took an effective part in the subsequent memorable campaign, both as a bard and a soldier. It was in the former capacity however that he most distinguished himself; his 'Minstrel in the Russian Camp,' a series of songs on the war, created unbounded enthusiasm among the soldiery, were struck off at a military printing-press, and circulated in all camps throughout the army. The poet however, unaccustomed to the fatigues of a military life, was attacked by fever, and obliged to quit the army early in 1813. The Empress mother, Maria Theodorovna, who had been delighted with his poeme, was anxious to see and

Digitized by Google

to reward the 'Minstrel,' a splendid edition of the work was issued with a poetical epistle to herself, and Zhukovsky, who had been decorated with the order of St. Anne for his military services, received from the Emperor Alexander a pension for life of 4000 rubles. For some years afterwards his time was chiefly spent at court at St. Petersburg in the enjoyment of imperial favour, of great success in society, and till the rise of the Russian Byron, Pushkin, of the reputation of being the first poet of Russia.

His most popular productions in this his most productive period were a number of ballads, a species of composition which he was the first to introduce into Russian literature. His first poem of the class, 'Zindmilla,' an imitation of Bürger's 'Lenora,' startled the Russian public into a burst of enthusiastic admiration. He afterwards treated the same subject with variations in a poem entitled 'Svietlana,' which he is still considered his masterpiece, and finally he translated 'Lenora' itself simply from the German into Russian. Almost all his subsequent ballads are founded on foreign originals, and constitute what some of the Russian critics are fond of calling the 'luminatsky imitations' of Zhukovsky. But how far the imitation extends it is not always easy to ascertain, for in most cases he takes the liberty of suppressing the name of the original author. The reader who is acquainted with the poetical literature of England, France, and Germany, in looking through the ballads of Zhukovsky, is continually meeting with old faces and old favourites. From Southey alone, the Russian poet borrowed, without the mention of Southey's name, 'Queen Orraca and the Five Martyrs of Morocco,' 'Rudiger,' 'The Old Woman of Berkeley,' and 'Lord William,' the title of the last of which he altered to 'Vadim,' that sparrow-grass which the Russian alphabet allows to the English 'Warwick.' Still more strangely, while the ballad of 'Smailholm Tower' is acknowledged to be taken from Walter Scott, a tolerably close version of the condemnation of Constance, from the second canto of 'Marmion' is presented to the reader of Zhukovsky's works, as 'The Trial Underground, a fragment of an unfinished poem.' This mode of proceeding is not confined to Zhukovsky, and seems to be in accordance with the Russian code of literary ethics: as, though the native critics must be aware of the fact, we have never seen it mentioned with blame. How apt it is to be misled, may be shown from the example of Merimée, who, in his life of the false Demetrius, speaks of the beauty of the Polish ladies as being so remarkable as to have drawn from the Russian Byron, Pushkin, the very curious compliment paid to it in the ballad of 'The Three Sons of Slepta,' quite unaware that that ballad in question is the transference without acknowledgment from the Polish Byron, Mickiewicz.

Leaving their origin out of view, the ballads of Zhukovsky are beautiful specimens of animated narrative, and in his own poem of 'Svietlana' (which has been translated into English by Browning) there is a power and force of what is now called 'word-painting,' which have rarely been equalled in any language. In his first romantic poem, 'Ruslan and Liudmila,' Pushkin showed a similar power, and Zhukovsky sent a present of his works to him with the inscription, "From the conquered teacher to his conquering pupil." They became intimate friends, and around them were grouped for several years all the most eminent literary society of St. Petersburg, which was in the habit of meeting at Zhukovsky's house. All shades of opinion were represented. Zhukovsky, a favourite at court, was a contributor to 'The Polar Star,' edited by Bestuzev and Rulyeev, who afterwards perished on the gallows and in exile for their conspiracy against the Emperor Nicolas. Zhukovsky became more and more connected with the imperial family. When the Grand-Duke Nicolas married a Prussian princess, he was selected to teach her the Russian language; and when Nicolas became emperor, and the offspring of the marriage, the hereditary prince, was of an age to require a preceptor, Zhukovsky was appointed to the office. This withdrew him for some years from the active pursuit of literature, but enabled him in various ways to act efficiently for the benefit of his literary brethren. It was by the influence of Zhukovsky that Hertzen [HERTZEN] was allowed to return from exile, and that Mickiewicz [MICKIEWICZ], the Polish poet, obtained permission to quit Russia, which he had entered as a captive. He too had probably a hand in obtaining a pension for Pushkin's widow after the decease of her husband, whose death he witnessed and described, but in a letter singularly jejune and destitute of his usual fire. It was remarked that, by a singular coincidence, the death of Pushkin took place on Zhukovsky's birthday, the 29th of January (o.s.). When the hereditary prince, now (1857) the Emperor Alexander II., made extensive tours through the vast empire which was to fall under his sceptre, Zhukovsky acted as his Mentor, and he also accompanied him in his visit to Germany, Italy, and England. The poet had made tours in Germany and Italy before, but to England this was his first visit; and though some of his poems had been translated by Bowring, and noticed by Byron, it is probable that the "Minstrel in the Russian camp" was recognised by few under the disguise of the French appellation on his cards—"M. de Joukofsky." On his visit to the British Museum however, one of the assistant-librarians, who was a student of Russian literature, had the satisfaction of showing him an edition of his works which had just been added to the national library. Shortly after the prince's return to Russia, his preceptor's functions ceased. Zhukovsky's health had for some time been indifferent, and he transferred his residence to Germany, a country of which it is said he was "passionately fond," to have the benefit of the waters. He had always been a panegyrist and an admirer of domestic life, but he had now attained his fifty ninth year and was still a bachelor. The Hereditary Prince in his European tour had been in search of a wife, and on the 28th of April 1841 he married the present Empress of Russia, the daughter of the grand-duke of Hesse. Within a month the preceptor followed the pupil's example. On the 21st of May 1841, at a little Russian chapel on a hill near Carstadt, which was decked out for the occasion with the pictures who had been queen of Wirtemburg, he was married to a beautiful girl of the name of Reutern, the daughter of an old officer and native of one of the Baltic provinces. Six years afterwards he wrote to a friend in raptures at the domestic happiness which had fallen to his portion. He chiefly passed his time as a retreat in the neighbourhood of Dusseldorf, and showed himself with translating into Russian poems by Ferdusi and Homer. Two children, both boys, were the offspring of the marriage, and his chief delight was in superintending their education, which he wished that his life might be prolonged to his eightieth year to see completed. Neither this wish nor that of revisiting Russia was fulfilled. On the 12th of April 1852, Zhukovsky died, calm and resigned, at Baden, in the bosom of his family. Ilia remains were afterwards removed to his native country.

An edition of Zhukovsky's works which appeared at St. Petersburg in 1835-37, fills eight octavo volumes, and three additional ones were published under the title of 'New Poems' in 1849. Only one of these eleven volumes consists of prose, the remainder is all either original or translated poetry. Among the prose the palm is generally given to a tale entitled 'Marina Roshtcha' (Mary's Grove), the name of a favourite resort of the inhabitants of Moscow, which ever since the tale appeared has been regarded in the light of a classic spot. There are some fragments of a diary kept by Zhukovsky on his tours in Italy and Germany, which are singularly vivid, but nothing apparently has been published from his journal of his visit to England. Among the poems 'Svietlana' is the masterpiece, and he is often called by his admirers 'the poet of Svietlana.' One of the volumes is occupied with a poetic version of La Motte Fouqué's 'Undine,' and most of another with a version of Schiller's 'Maid of Orleans,' in both of which Zhukovsky is thought by Russian critics to have surpassed the originals. His later works consist almost entirely of translations, one from the 'Shah-Nameh,' into a metre not in the least resembling that of Ferdusi, the other from the 'Odyssey' of Homer, into hexameters. Zhukovsky has information us in the preface, but understands a word of Greek, he had composed his version by means of an interlinear translation of the original which a German professor (Grashof) had been kind enough to make for his exclusive benefit, and candidly admits that to the question "If he has succeeded," he can make no answer, as he can be no fair judge, not being able to make a comparison. Those who can make it are not likely to be satisfied with his success. Considering the genius of Zhukovsky, and the great resemblance in many points of the Greek and Russian languages, the difference between the exquisite beauty of the original and the unpleasing abruptness in the copy is very striking. In addition to the translations from the English that have been already noticed, it may be mentioned that Zhukovsky also rendered into Russian the 'Alexander's Feast' of Dryden, Moore's 'Paradise and the Peri,' which he entitled 'The Angel and the Peri,' Byron's 'Prisoner of Chillon,' and numerous other pieces, some of which bear the names of the original authors.

A critical essay on Zhukovsky by Sneguirev appeared in the 'Moskvitanin' for 1853, and has been separately published. It is accompanied by a minute chronology of all his writings by Tikhonravov.

ZIEGLER, FRIEDRICH WILHELM, a popular actor and dramatic writer of Germany, was born at Brunswick in 1760. His fine person, and his great talents as an actor, made the Emperor Joseph II. anxious to gain him for the court theatre of Vienna, and his success as his own expense sent him to the best German theatres for the purpose of studying and cultivating his art, and afterwards appointed him to the court theatre of Vienna, where Ziegler remained for nearly forty years. Not satisfied with his fame as an actor, Ziegler endeavoured to obtain the higher reputation of a dramatic author. His attempts were crowned with success, and he became one of the most popular and prolific writers of the day. His plays, partly comedies and tragedies, and partly domestic dramas, were performed at Vienna and in nearly all the towns of Southern Germany, where they enjoyed a popularity equal to those of Iffland and Kotzebue. Invention, situation, and effect were generally happily combined in his plays, and he showed a great practical knowledge of theatrical affairs: owing to these circumstances, some of his plays, such as 'Parteiwuth' and 'Die vier Temperamente,' still continue to be acted, although the language is rather obsolete. In 1798, when Kotzebue went to Vienna as the successor of Alxinger, Ziegler and some others formed so strong an opposition to him, that he quitted Vienna after two years. As Ziegler was engaged in the service of the imperial court, he frequently allowed himself to be made use of for political purposes, partly by writing plays with certain political tendencies, and partly by hints and allusions. A collection of his dramatic works, in 5 vols. 8vo, appeared at Vienna, 1791-94. A more complete collection of Ziegler's 'Sämmtliche Dramatische Werke,' in 13 vols. 8vo, appeared

Digitized by Google

at Vienna in 1824. He made also several attempts as a critic on the dramatic and other arts, but his success was small, as he possessed little philosophical knowledge, whence his æsthetical works are very confused and almost worthless. His principal works of this kind are —1, 'Zergliederung von Hamlet's Character nach Psychologischen und Physiologischen Grundsätzen,' 8vo, Wien, 1803; 2, 'Die Dramatischen Schauspielkunst in ihrem ganzen Umfange,' 8vo, Wien, 1821; 3, 'Der innere und äussere Mensch in Beziehung auf die bildenden Künste, besonders auf die Schauspielkunst,' 2 vols. 8vo, Wien, 1825. In the year 1801 Ziegler left the stage, and had a pension given to him for the remainder of his life, which he spent principally at Presburg. He died at Vienna, on the 21st of September 1827.

ZIMMERMANN, JOHANN GEORG VON, was born on the 8th of December 1728, at Brugg, a small town in the German part of the canton of Bern. He belonged to a distinguished family, especially on his mother's side, and as she was a native of the French part of the canton of Bern, Zimmermann acquired from his childhood an equal facility in speaking French and German. His education was conducted in the house of his parents up to his fourteenth year, when he was sent to Bern to prepare himself for the university. In 1747 he went to Göttingen, to study medicine, and there he was received by Haller, his countryman, in the kindest manner. Haller took him into his house, and assisted him in his studies, which were not confined to subjects directly bearing upon the medical profession; no branch of knowledge was without interest for him. He also learned English, and gained an intimate acquaintance with English literature, for which he had always a great partiality. His love of study was so great, that he scarcely ever took any relaxation; and he thus laid the foundation of an illness by which he suffered all through life. He was aware of his over-exertion, and he wrote from Göttingen to a friend: "I here lead the life of a man who is desirous to live even after his death." The first symptoms of melancholy appeared while he was yet at Göttingen. When he took his degree of doctor of medicine, he wrote a 'Dissertatio Physiologica de Irritabilitate' (4to, Göttingen, 1751), by which he acquired considerable reputation as a theoretical writer on medicine, both on account of the independence of his judgment and the soundness of his observations: this little work is still held in great esteem. It was translated into Italian by P. Gian Vincenzo Petrini (8vo, Naples, 1756). After leaving Göttingen he spent a few months in Holland and at Paris, and then returned, in 1752, to Bern, where he commenced his career as a physician with great success. Shortly after, Haller went from Göttingen to see his friends at Bern, and as for the restoration of his health, and for the beauty of place had such charms for him, that he resolved not to return to Hanover. Zimmermann was commissioned to fetch Haller's family from Göttingen, and not long after he married a relation of Haller.

About this time the place of public physician (Stadt physicus) at Brugg became vacant, and Zimmermann, who had already acquired great reputation as a physician, was prevailed upon to accept it on account of the property and family connections he had at Brugg. His practice here increased to an extraordinary degree, for no physician surpassed him in the quick perception of the nature of diseases and the remedies required to remove it; patients came from all parts of Switzerland and from the adjoining countries to have his advice. But although he loved his profession, independent of all pecuniary advantages, he could not confine himself to the mere practice of the art, and he was unable to forego the pleasure of devoting himself to more extensive studies. His numerous professional engagements, and the fact that at Brugg he had no friends of congenial pursuits, produced great mental discontent. Zimmermann, with all his philosophy, had not the power of accommodating himself to circumstances, and while he was ever longing for the intellectual enjoyments of Göttingen and Bern, he refused, like a spoiled child, to enjoy the pleasures which he might have had. His hypochondriac disposition was thus gradually developed, and increased his love of solitude. He avoided society as much as he could, and spent all his leisure hours in reading, although he discharged his professional and official duties with the utmost strictness, and treated his patients with a kindness and cheerfulness which often produced the best effects. It is remarkable that even during the strongest attacks of hypochondriasis Zimmermann appeared a different man as soon as he entered the sick-room. In 1756 he published his first essay on Solitude, which is only a sketch of his celebrated work with the same title, which he published about thirty years later. About the same time he formed the plan of his work on Experience in Medicine ('Von der Erfahrung in der Arzneykunst'), which however did not appear till 1763 (2 vols. 8vo, Zürich). A second edition, in one volume, appeared at Zurich, 8vo, 1787. It is only a fragment; the author intended to add two more volumes, but he did not carry out his plan. This work possesses the greatest interest for the student of medicine and every one else. The philosophical spirit which pervades it, the amount of experience, and the sound rules as to the manner in which a medical man should observe, render it still a work of great utility. It has been translated into French and Italian. A third work was on National Pride ('Vom Nationalstolze,' 8vo, Zurich, 1758; the sixth edition appeared at Zürich, 8vo, 1789), the popularity of which is attested by the numerous editions and translations into French, Russian, English, and other languages. Zimmermann examines national pride in all its manifestations, investigates its causes and results, with a clearness and freedom from prejudice which are seldom found in similar works. The whole is interwoven with pleasing anecdotes. There are two English translations of it; the first bears the title, 'Essay on National Pride; translated from the German,' 12mo, London, 1771, but is much interpolated and altered. The second, by S. H. Wilcocke (8vo, London, 1797), is much better, and contains a memoir of Zimmermann.

Although his residence at Brugg was the source of discontent and melancholy, yet it is the period during which Zimmermann produced his best works, or at least, as in the case of that on Solitude, formed the plan of them. These works spread his fame far and wide, and the most distinguished learned and scientific societies of Europe honoured his merits by making him a member. This celebrity, instead of making him happier, only increased his desire to have a wider sphere of action. Many honourable offers were made to him from various parts of Europe, but he had not resolution enough to accept them, or they were not to his taste. At last however the post of physician to the King of his Britannic majesty at Hanover, and the title of aulic councillor, were offered to him, through the influence of a friend. This offer seemed to satisfy his wishes, and in 1768 he went to Hanover. But the world in which he now lived was as little calculated to give him happiness as that at Brugg. The jealousy of one of his colleagues, and the pretensions of persons of quality and their unreasonable demands on his time, caused him not a little annoyance and vexation; he felt his own dignity too much, and had too just a notion of the duties of a physician to determine the number of his visits and their duration by anything else than the nature of the illness. Those who were offended at such straightforward conduct, did not of course contribute to make his residence at Hanover pleasant. But notwithstanding this, there was at that time no physician in all Northern Germany who enjoyed such unbounded confidence as Zimmermann, and the patients who consulted him were so numerous that he had little time left to indulge in his hypochondriac disposition. During this period of uninterrupted activity in his profession, his only recreation consisted in occasional visits to several of the courts of Germany, where his advice was requested, and to the waters of Pyrmont. But in a short time he found that tyrannical feeling of being a place of rest for him, was a much more busy place than Hanover, for persons flocked thither from all parts when it was known that he was there. In 1770 his wife died, and he himself was at the time suffering from internal disease, which induced him the year after to go to Carlsbad for the purpose of drinking the waters operation. He remained at Berlin for five months, and made the acquaintance and friendship of the most distinguished men of that capital. He was also introduced to Frederic the Great, with whom he had a long conversation. On his return to Hanover he felt in good spirits, and as he had got rid of the cause of his bodily suffering, he looked forward to happiness. But his great professional exertions brought on a return of his old complaint, and in its train came his former depression of spirits, which was increased by the death of his daughter. He had not only a son left, and this son was constantly in ill-health, which at length terminated in a state of perfect insensibility. The friends of Zimmermann, who pitied his situation, prevailed upon him to marry again: the influence which his young wife exercised over him promised to be most beneficial: he seemed to revive, he became cheerful, and took pleasure in social circles. The fruit of this happy period was the working out and completion of his great work on Solitude ('Ueber die Einsamkeit'), in 4 vols. 8vo, which appeared at Leipzig in 1784 and 1785. This work, the best and most matured of all his productions, was soon translated into all the languages of Europe, and became as popular in foreign countries as in Germany. The English translation, under the title 'Solitude considered with respect to its influence on the Mind and the Heart' (8vo, London, 1791), was made from the French translation of J. B. Mercier, which however is only an abridgment of the original; for Mercier had not the boldness to lay before the French public all the important disclosures which the original work contains. This book on Solitude procured the author friends and admirers in all parts of Europe. The Empress Catherine II. of Russia sent him a magnificent present, accompanied by a letter in which she thanked him for the salutary prescriptions he had given to mankind; she also invited him to St. Petersburg and offered him the post of her private physician. On his declining to go to Russia, the empress requested him to recommend a number of young physicians who were willing to settle in her dominions. This request was readily complied with, and Zimmermann was knighted, and received the order of St. Wladimir as a reward.

In 1786, when Frederic the Great was attacked by his last illness, he wrote two letters to Zimmermann to invite him to come to Potsdam and give him his advice. On his arrival there, Zimmermann discovered that the king's case was hopeless, and he refused to prescribe any powerful medicine. His visit to Potsdam was the turning point in his life: until then he had been the favourite of the public as a philosopher, a physician, and a highly gifted writer, but he now left the path in which he had earned his just laurels, and all he wrote after this time served rather to destroy than to increase his reputation. After his return from Potsdam he wrote two works on Frederic the Great: 'Ueber Friedrich den Grossen und meine Unterredung mit

Digitized by Google

ihm kurz vor seinem Tode' 8vo, Leipzig 1788, and 'Fragmente über Friedrich den Grossen,' 3 vols. 8vo, Leipzig, 1790, which created the greatest sensation in Germany, and involved the author in disputes which ended only with his life. These works pretend to give an account of the king, derived from sources to which no one had had access before. They contained attacks on men of unblemished character, and Zimmermann charged them with things which had no existence except in his own imagination. Truth itself seemed no longer to be sacred to him, and various calumnious reports respecting the private life of Frederic the Great and other eminent men were set forth as new discoveries, and that in so coarse a manner as to offend the good feeling of the public. The cause of this change in his conduct must be looked for in his discontented disposition, and the desire to shine in a new sphere for which he was not fitted—perhaps also to a temporary history. The peculiar state of his own mind prevented his gaining a clear perception of things, and made him see in the political changes of the time nothing but conspiracies to upset religion and all social order. The opposition he met with, especially on the part of the freethinker Dr. Bahrdt, and A. Hoffmann, only increased these feelings. He now devoted all his time to the combating of the monsters which his own imagination raised up, with the exception of two hours every day, which he gave to his patients. His diseased imagination represented to him Jacobins, Illuminati, and the promoters of improvements of every kind, as persons animated by the same evil spirit, and he denounced them all as criminals who ought to be put to death by the hangman. In order to secure the assistance of all governments against them, he drew up a memorial, which he sent to the Emperor Leopold, and which had the following title: 'Ueber den Wahnwitz unseres Zeitalters und über die kraftigsten Hulfsmittel gegen die Mordbrenner, die uns aufklären wollen, und gegen die Untergrabung und Vernichtung der Christlichen Religion und der Fürstengewalt.' It consisted of 320 quarto pages. The emperor intended to place it before the princes' diet at Ratisbon, and to call upon the princes of the empire to put an end to the proceedings of the Illuminati. But the death of the emperor, who had testified his gratitude to Zimmermann by a handsome present, prevented this plan being carried into effect. Zimmermann however believed his exertions till the year 1794, when his physical as well as mental powers began to decline, and he was obliged to give up all his occupations. His melancholy rose to a deplorable height. The French revolution was making rapid progress, and he fancied that the French were leading him out and intending to put him to a cruel death as an aristocrat; he even thought of taking to fight, and as his physician believed that a change of place might be beneficial, Zimmermann went to Eutin in Holstein. But no means were of avail, and, after an absence of three months, he returned to Hanover in a worse condition than he had left it. His fear of his enemies was at last increased by the dread of poverty and starvation, a monomania which the most substantial proofs of the contrary were unable to destroy. Wherever he went he fancied that he was diffusing the miasma of the plague; in short his mind was completely deranged, and after great bodily and mental suffering, both real and imaginary, he died on the 7th of October 1795, in the sixty-seventh year of his age.

Zimmermann was one of the most remarkable men of the last century, both as a physician and a philosopher. He possessed an inexhaustible imagination, great sagacity and judgment, and most extensive knowledge not only of medicine, but also of philosophy, history, and the whole range of ancient and modern literature. The great works which he wrote previous to 1786 are masterly productions of their kind. During the latter period of his life his powerful sensibility and his hypochondriac disposition had ruined his mental powers, and for all he did during that period he perhaps deserves more to be pitied than to be censured. Besides the works which we have already noticed, and a number of essays in literary and scientific journals, the following deserve to be mentioned: 1, 'Leben des Herrn von Haller,' 8vo, Zurich, 1755; 2, 'Vertheidigung Friedrichs des Grossen gegen den Grafen von Mirabeau,' 8vo, Hanover, 1787; 3, 'Versuch in anmuthigen und lehrreichen Erzählungen, launigten Einfallen und Philosophischen Bemerqungen über allerlei Gegenstande,' 8vo, Göttingen, 1779: this is a collection of essays which Zimmermann had contributed from time to time to a Hanoverian periodical, and were published in one volume by an anonymous editor; 4, 'Zerstreute Blätter vermischten Inhalts,' edited by a friend of Zimmermann after his death (8vo, 1799); 5, 'Die Zerstörung von Lissabon,' 4to, Zürich, 1756: this is an epic poem of no great value, which some friends of the author got published without his knowledge.

The number of works on the life and writings of Zimmermann is very great: the following are the best among them: S. A. D. Tissot, *Vie de M. Zimmermann*, 8vo, Lausanne, 1797; J. E. Wichmann, *J. G. Zimmermann's Krankengeschichte, ein Biographisches Fragment*, 8vo, Hanover, 1796: *Zimmermann's Verhältnisse mit der Kaiserin Catharina II., und mit dem Herrn Weikard, &c.*, 8vo, Bremen, 1803; Horing's *Zimmermann*, in the *Zeitgenossen*, third series, No. 6; *Zimmermann's Briefe an einige seiner Freunde in der Schweiz*, 8vo, Aarau, 1830.

ZINGARELLI, NICOLO, a celebrated Italian composer, was born at Naples in 1752. After receiving a complete musical education from some of the greatest masters of that day, he betook himself to dramatic composition, and produced several operas for the theatres of Naples, Milan, and Venice. He visited Paris in 1789, when his opera of 'Antigone,' of which the poem was written for him by Marmontel, was performed at the Académie Royale de Musique; but the storms of the Revolution drove him from France, and he returned to Italy. His operas were successful, but are now forgotten. Like most of the Italian dramatic music of that day, they gave way to the more brilliant style introduced by Rossini and his followers; and moreover, Zingarelli's genius and inclination led him to the cultivation of sacred music, to the study of which, on his return to Italy, he entirely devoted himself. He was elected maestro di capella in the cathedral of Milan, and on the death of Guglielmi in 1806 he succeeded that master in the chapel of the Vatican. He remained at Rome till 1811, when, having refused to comply with an order of the Emperor Napoleon to compose a Te Deum for the birth of the King of Rome, he was sent to Paris a prisoner under an escort of gendarmes. This strong measure, it seems, was taken without the sanction of the emperor, who ordered the composer to be immediately released, and compensation to be made him for the injury he had suffered; and Mainz, then king of Naples, placed him at the head of the Conservatory of that city, then one of the greatest schools of music in Europe. This office he continued to hold till his death in 1837. Zingarelli's sacred works consist of oratorios, cantatas, and masses. His principal oratorio, 'La Distruzione di Gerusalemme,' is a masterpiece of the grand and simple but profound Italian style, which is now extinct; and its reproduction, by the conductors of some of our sacred concerts, would be an act of good taste, and probably good policy. As the head of the great Neapolitan Conservatory, Zingarelli was the instructor of several of the most eminent composers of the day, and in particular of his countryman Costa, now a naturalised Englishman, whose noble oratorio, 'Eli,' produced at the last Birmingham Festival, and since repeatedly performed at Exeter Hall, does honour to the master under whom he studied.

ZINGG, ADRIAN, a very clever Swiss draughtsman, etcher, and copper-plate engraver, was born at St. Gallen in 1734. His father was likewise an engraver, and he instructed his son in his art; but Adrian Zingg went early to Zürich, and continued the study of engraving with Rudolph Holzhalb. He went afterwards to Bern in 1757, and became the pupil of Aberli, with whom he became an excellent draughtsman and etcher of landscapes. In 1759 Zingg went with Aberli to Paris, and there studied several years with J. G. Wille, for whom he engraved many plates, by which he established a reputation as an excellent engraver. His visit to Italy in 1766, with Aberli, at Paris, by the Saxon government to Dresden, where he was appointed engraver to the court, and professor of engraving in the academy of Dresden; he was likewise elected a member of the academies of Vienna and Berlin. He died at Dresden in 1816, according to Heller.

Zingg's works consist of some marine landscapes, many views in Switzerland, some of the best landscapes in the Dresden Gallery, and several prints from his own drawings, principally in the vicinity of Dresden. He engraved an excellent print of the celebrated picture of the 'Sleeping Faunt,' by Rembrandt, in the Dresden Gallery: he has engraved also after Both, J. Vernet, Vander Neer, Dietrich, Agricola, Aberli, Brand, and others. His plates after Dietrich are numerous, and he engraved a considerable number after his own designs, which he drew with a pen.

ZINZENDORF, NICOLAUS LUDWIG, COUNT VON, the founder (or rather restorer) of the sect of the Moravian Brothers, or Herrnhuters, was the son of Count Georg Ludwig von Zinzendorf, chamberlain and state-minister of Augustus II., elector of Saxony and king of Poland. He was born on the 26th of May 1700, and lost his father at an early age. His mother made a second marriage with the Count Von Natzmer, a Prussian field-marshal; and young Zinzendorf was educated under the care of his maternal grandmother, the widow of Baron von Gersdorf, a pious and learned lady, who wrote some hymns and treatises on religious subjects, and corresponded, like him, with several distinguished divines and scholars. This lady lived on her estate in Lusatia, where she was frequently visited by pious men: the celebrated Jacob Spener was her most intimate friend, and it was the influence of this divine, who was considered the head of the Pietist sect, which produced in the mind of young Zinzendorf that religious tendency which made him noticed when a mere child, and in later years led him to aim at reforming the Protestant faith. In 1710 Zinzendorf was sent to the Paedagogium at Halle, which was then directed by Francke, to whose particular care he was intrusted. In that school Zinzendorf remained six years, and as Pietism was the ruling principle there also, he abandoned himself entirely to religious pursuits, and founded a mystical order among his fellow-pupils, which he called Der Orden von Senfkorn, or the Order of the Grain of Mustard-seed, in allusion to the passage in St. Matthew (xiii. 31, 32). His family however was not pleased with the theological occupations of a young nobleman, whom they wished to bring up as a statesman, and not for the church, which had been deserted by the Protestant nobility of Germany since the bishoprics and rich prebendaries had been abolished by the zeal of the secular princes. Zinzendorf was accordingly sent to the university of Wittenberg (1716), where was a spirit in religious matters quite opposite to the Pietism of Halle; but far from giving up his pursuits, he continued to hold religious meetings in his house and elsewhere, and resolved to take orders and

Digitized by Google

devote himself entirely to the church. It is however said that his life there presented a striking contrast with his principles; he was as often seen in gaming-houses as in conventicles; he dressed in the most fashionable style, and being possessed of great personal beauty, imagination, and vivacity, he became the favourite of women whose moral character was suspicious. It is said that he endeavoured to reclaim them to better principles, but it is also true that the doctrines which he afterwards preached presented a strange mixture of idealism and sensualism, and exposed him not only to vulgar slander, but to the reproach of a bad life and hypocrisy, with which he was charged by several of the gravest divines of his time. It was only for a short time that Zinzendorf led this equivocal course of life. During his stay at Wittenberg he formed a lasting friendship with Frederick von Watteville, a young patrician of Pern, who afterwards became the protector of the Moravians in Switzerland; and as early as 1715 he made the acquaintance of Ziegenbalz, the German missionary, on his return from the coast of Malabar, where he had been sent by the Danish government. Ziegenbalg was accompanied by a young native of Malabar, whom he had converted to Christianity; and it is said that the sight of this proselyte inspired Zinzendorf with the idea of propagating the Christian religion among the heathens, a design which he never lost sight of, and which he ultimately carried into execution.

In 1719 Zinzendorf left Wittenberg, and travelled to Holland and France, for the purpose of making the acquaintance of distinguished divines. His religious principles at that time were in accordance with the Confession of Augsburg: he was of course not yet a sectarian, and distinguished himself from his fellow-believers only by his greater zeal and more fervent piety. At Paris he was highly distinguished by the jurist Vitriarius and by Basnage, both of whom encouraged him to preach, which he did with the greatest success. From Holland he went to Paris, accompanied by his friend the count of Reuss-Ebersdorf. Having been introduced to the nobility and at the court, he availed himself of the opportunity, and endeavoured to convert them to the Lutheran Church. On some his sermons had a good effect, others styled him a Jansenist and Pietist; but to the majority he was an object of laughter and mockery. None however ventured to ridicule him to his face. Instead of an ordinary preacher of awkward manners and uncouth Teutonic expressions, they saw a nobleman accustomed to frequent the most aristocratic societies, who spoke French elegantly, and who, notwithstanding his youth, showed so much talent, learning, and self-possession, that wherever he appeared he was an object of general attraction. He maintained serious discourses on religion in the midst of the most frivolous society in the world; he was much noticed by the first men in Paris, and was frequently at the court of the Duke of Orleans, then regent of France. Lord Stair, the English ambassador at Paris, treated him with great respect. Father De la Tour, the general of the order of the Oratorians, introduced him to the archbishop of Paris: the prelate and the count endeavoured to convert each other, but neither succeeded. From Paris Zinzendorf went to Switzerland, and thence returned to Saxony in 1721. Being now of age he was entrusted with the management of his extensive estates, and the elector of Saxony appointed him a member of his aulic council. The count however was seldom seen at its meetings, and he resigned his place in 1723. As early as 1722 he married the sister of his friend the count of Reuss-Ebersdorf, and retired with her to his seat of Berthelsdorf in Upper Lusatia. One day a man called upon him, named Christian David, a carpenter from Moravia, who had travelled much: he belonged to the obscure sect of the Moravian Brothers, who professed the doctrines of John Huss in some remote corners of Moravia. David, who was a pious man, having informed the count of the oppression under which they lived under the Austrian government, Zinzendorf invited him to settle on his estate, and to bring thither such of his friends as would prefer liberty of conscience in a foreign country to religious oppression at home. David accepted the proposal, and returned in the course of the summer of 1722, with three men, two women, and five children, to whom the count gave some land and a wooden house situated at the foot of the Hutberg, or 'pasture-hill.' Such was the beginning of the celebrated colony of Herrnhut; for this name, which signifies 'the lord's guard,' was given by Zinzendorf to the settlement in allusion to the double meaning of the word 'Hut,' which signifies 'guard,' as well as 'a place were flocks are guarded,' that is, 'a pasture-ground.' The first settlers were so poor, that the countess presented them with some clothes and a milch cow, to prevent the children from starving; but they were industrious and good people, and soon got into better circumstances.

It was on this occasion that Zinzendorf first conceived the idea of forming a sect, and he published the principles of the new creed in several pamphlets, which sometimes contradict one another, but from which we may nevertheless see that he did not intend to separate from the Augsburg Confession. Herrnhut was destined to become the centre of that sect, and he invited other Moravian brothers, whose religious principles seemed to him to correspond best with his own, to settle in the new colony, to which he gave his solemn benediction. He supported the settlers with great liberality, and he and his flock soon attracted the attention of Germany and other Protestant countries. The number of his adversaries increased with that of his followers: he was attacked publicly and privately; but he also received proofs of respect and esteem from the highest quarters: the emperor Charles VI. invited him to his court at Vienna, but Zinzendorf declined this honour as well as many others. Faithful to his plan of converting the heathen, Zinzendorf went to Copenhagen in 1731, for the purpose of inquiring into the state of the Danish missions in Greenland, and the East and West Indies; and he despatched several of his disciples as missionaries to those countries. This is the origin of the system of the Moravian missions which are now scattered over the world. The king of Denmark, Christian VI., rewarded his zeal with the Knight Cross of the Order of Dannebrog, which Zinzendorf accepted; but he sent it back five years afterwards. In 1734 Zinzendorf went to Stralsund for the purpose of being ordained a minister of the Lutheran Church. As his enemies were numerous, he adopted the name of Ludwig von Freideck, and engaged himself as tutor in the house of a merchant named Richter. After having been examined by the members of the consistory at Stralsund, he received ordination and preached in the chief church of that town. It is said that he became a tutor because he had devoted all his property to the establishment of his colony of Herrnhut, and wanted a livelihood; but this is scarcely credible. If he had lost his property, his devoted adherents would have supported him; or his brother-in-law, the count of Reuss-Ebersdorf, who was his sincere friend, would have supplied him with the necessary means. Besides, Zinzendorf continued to travel about the world; and although he was often in temporary want of money, because he spent large sums on the colony, he was never obliged to give up his plans for want of funds. In 1735 he intended to go to Sweden, but on his arrival at Malmoe, he was ordered to leave the kingdom immediately. Upon this he attacked the king of Sweden, Frederick of Hesse-Cassel, in a pamphlet, of which he sent copies to the principal courts of Europe. This made him new enemies, and in 1736 he was banished from Saxony on the charge of having introduced novelties and preached dangerous principles in meetings of a suspicious character, which tended to weaken the authority of the government and to bring into contempt the services of religion as practised by the Lutheran Church. Zinzendorf took refuge with his brother-in-law, the Count of Reuss-Ebersdorf, who was a sovereign member of the empire; and it was only in 1747 that he was allowed to return into Saxony. In the same year, 1736, he went to Holland, at the request of the princess-dowager of Orange, and founded the colony of Z Heerendyk (the lord's dyke), which was afterwards transferred to Zuyst. Thence he went to Livonia and Esthland, caused the Bible to be translated into the Livonian and Esthonian languages, and established several Moravian colonies there. On his return he was received in Prussia by the king of Prussia, Frederick William I., who had a very unfavourable opinion of Zinzendorf, whom he believed to be a vulgar fanatic; but no sooner was the count introduced to the king, and spoke to him with that gentle and noble persuasion which had always distinguished him, than the king changed his opinion. Their conversation lasted three days, and the king was so pleased with him that he promised to acknowledge him as bishop of the Moravians, if the count would be ordained. Zinzendorf having agreed to the proposal, the Reverend Jablonski, who held the office of the king's first court preacher, ordained him bishop (May 1737). The ordination of a bishop, by one who was not a bishop, was hardly in concordance with the canon law; but as Luther had ordained a bishop (Amsdorf), although he himself was no bishop, the practice seemed to be justified; and the ordination finally contributed to raise Zinzendorf in the opinion of the world, although, strange enough, the king of Prussia would not allow him to preach in public.

About this time Zinzendorf was informed that he might return to Saxony if he would sign a paper declaring himself guilty of several charges which had been brought against him by slanderers, but he flatly refused to do so, and continued to live in exile. In the same year (1737) he went to London, and held private meetings in his house, which were attended by a great number of both pious and curious persons, and led to the establishment of a Moravian congregation. Wesley received him with great kindness and esteem: and it is said that each of them tried to convert the other, but of course without effect. They were often engaged in discussions on religious subjects, and they argued particularly the question, whether men could attain perfection in this world, which Wesley affirmed, but Zinzendorf denied.

From London Zinzendorf proceeded to the Danish colony of St. Thomas in the West Indies, and on his arrival there found that the Moravian missionaries who had been sent thither a few years before had been thrown into prison, and their chapels shut up by order of the local government. He succeeded in obtaining their liberty, and defended his and their cause with so much eloquence that the governor promised not to obstruct the religious services of the brotherhood. He now returned to Germany, and made a tour through Switzerland, where Vernet and other French writers and philosophers received him with a kind of respectful curiosity, but avoided any intimacy with him; and in 1742 he set out on his great tour to the British colonies in North America. He was accompanied by his daughter, who was then only sixteen. No sooner had he arrived in Pennsylvania than he was assailed by accusations of a disgusting and revolting description, which he supported with his usual calmness and forbearance. At Germantown he performed divine service every Sunday, and made himself so popular that the inhabitants, who were mostly Germans, chose him their minister. He accepted the office with visible satisfaction, and

Digitized by Google

being afterwards obliged to continue his travels, wrote to Herrnhut, and caused one of the preachers there to proceed to America at his own expense, and to take his place as minister at Germantown. He also ordered a church to be built there at his own expense, for the use of the Moravian congregation, who had hitherto assembled in a barn. At Philadelphia Zinzendorf delivered a Latin speech in presence of a numerous auditory, to whom he declared that he considered his title of count to be inconsistent with his holy functions, and that he would henceforth be called Von Thumstein, which was the name of one of his estates. The Quakers in Philadelphia acted very kindly towards him, and defended him warmly against his detractors; they used to call him 'friend Louis.' After having visited the Indians in the interior of the country, and founded the celebrated colony of Bethlehem, he returned to Europe (1742).

During his absence the Moravian brothers in Livonia had endeavoured to establish their faith in an arbitrary manner in all the Lutheran churches of that country, and Zinzendorf was accused of having encouraged them to such proceedings. However, so far was he from having had the slightest idea of propagating his creed by other means than those of reasonable persuasion, that he immediately proceeded to Russia in order to justify himself. On arriving at Riga he received an order from the Empress Elizabeth to leave the empire immediately, and he was put under a military escort, which accompanied him on his return as far as the Prussian frontier, and prevented him from holding any communications with the inhabitants. A few years after this he was allowed to return to Saxony (1747). During his exile the brethren had increased in number and in wealth, and their good conduct and industry had made them many friends among people of rank, so that the government gradually treated them with less severity. Zinzendorf's numerous and powerful friends also pleaded in his favour, and the government was finally fully persuaded of the reformer's honesty by an offer of the brethren to buy the castle of Barby and its territory, which belong to the crown, but were of no use, as the castle was half in ruins and the soil barren, and for which the brethren offered to give one hundred and fifty thousand thalers (25,000*l.*), if they might be allowed to establish there a school of divinity. The Saxon government assented, full liberty of religion was granted to the brethren, and Zinzendorf returned to Herrnhut.

In 1749 he went to England, and through the protection of Archbishop Potter, General Oglethorpe, and several other men of influence whose attachment to the Church could not be doubted, he obtained an act of parliament for the establishment of Moravian colonies and missions throughout the British possessions in North America. He now set out for America to carry his plan into execution, and after an absence of some years returned to Herrnhut. His last great tour was in 1757, when he visited his friend Von Watterville at Lindau (1758), the canton of Bern in Switzerland, where he proceeded to Holland. He finally returned to his flock, and the Countess of Reuss, his wife, being then dead, he married Anne Nitschmann, the daughter of one of the first Moravians who had settled at Herrnhut, and who had for many years been superintendent of the spinsters at Herrnhut. Zinzendorf passed the last years of his active life in perfect quiet and retirement at Herrnhut, and when he died, after a short illness, on the 9th of May 1760, he was buried in the cemetery of that place; thirty-two Moravian preachers from all the countries in the world, some even from Greenland, bore his coffin, which was followed by two thousand brethren and a crowd of people of all ranks and confessions.

Zinzendorf's activity was unbounded, but he had excellent health. He wrote more than one hundred pamphlets, all directed to the propagation of his creed, or to the defence of himself and his brethren. The following are some of them:—'Atici Walfahrt durch die Welt' (Atticus' Travels through the World), a description of his first tour to Holland and France; 'Das gute Wort des Herrn' (The Good Word of the Lord), a kind of catechism; 'Die wahre Milch der Lehre Jesus' (The true Milk of the Doctrine of Jesus); 'Der Deutsche Socrates' (The German Socrates), a periodical, &c. Many of them are anonymous. He also wrote a great number of hymns, which are in the song-books of the Moravians; they are of a remarkable mystical tendency; the versification is often harsh and the style broken, but they are well adapted to the organ and to singing in chorus. His writings may generally be characterised as a compound of beauty and tastelessness, of clearness and mystical dimness, of deep thoughts and common places wrapt up in grand words. There is another defect, but only in the earlier writings of Zinzendorf, which deserves censure, although the author made apology for it, and regretted his aberrations in his later and cooler years. This is the pious obscenity which poisons many of his hymns and sermons, and is particularly conspicuous in such as treat of the mystical doctrine of Christ and his bride the Church, and the unctious of the Holy Ghost as a spiritual mother. Most of his sermons were not published, nor even written by him, but by others who took short-hand notes of them which they afterwards caused to be printed. Zinzendorf as a poet is the founder of a particular school of hymn-writers.

(Varnhagen von Ense, *Leben des Grafen N. von Zinzendorf*, in the fifth volume of his 'Denkmale;' this is the best biography of Zinzendorf; the author is considered to hold the first rank among German biographers; Spangenberg, *Leben des Grafen N. v. Zinzendorf*, from which extracts have been published by Reichel and Duvernoi; Spangenberg was one of the earliest friends and disciples of Zinzendorf, and his work is not impartial; an English abridgment of it was published under the title of 'Memoirs of the Life of Count Zinzendorf, Bishop of the Moravian Brethren,' by Spangenberg, translated by Samuel Jackson, with an Introductory Essay by Latrobe, 8vo, London, 1838; Müller, *Das Leben des Grafen N. von Zinzendorf*, in the third volume of his 'Bekenntnisse berühmter Männer.')

ZISKA, or more correctly ZIZKA, OF TROCZNOW, JOHN, the celebrated leader of the Hussites, was born under an oak-tree in the open fields, near the castle of Trocznow, in the circle of Budweis, in Bohemia, about 1360, or, as some say, about 1380. His father, the lord of Trocznow, was a Bohemian noble of more credit than wealth. John Zizka lost one eye at an early age, and hence it was said that he was called Zizka, which would signify 'one-eyed' in the Bohemian language. But this is a fiction; Zizka was the name of his family, and it does not signify one-eyed either in Bohemian or in Polish. At the age of twelve John Zizka was received among the pages of Wenceslaus, king of Bohemia and emperor of Germany, and he became distinguished among his fellow-pages by his gloomy temper and his love of solitude. Disgusted with the trifling and capricious character of Wenceslaus, Zizka left the court, and sought his fortune abroad. For some time he served as a volunteer in the English army, and distinguished himself against the French. He afterwards went to Poland, and commanded a body of the Bohemian and Moravian auxiliaries of King Wladislaw II., Jagiello, in his war against the Knights of the Teutonic Order. The dreadful battle of Tannenberg (15th of July 1410), in which the grand-master Ulrich von Jungingen was slain, with 40,000 knights and soldiers, was fought in the midst of which those auxiliaries, and John Zizka distinguished himself so much that King Wladislaw rewarded him with a chain of honour and other rich presents. The war being terminated by that battle, Zizka fought against the Turks in Hungary, and having again entered the English army, won fresh laurels at the battle of Azincourt (1415). After this he returned to Bohemia, and accepted a place as chamberlain at the court of King Wenceslaus, against his own inclination, and for reasons unknown.

Zizka was an adherent of the doctrines of John Huss, and the fate of this reformer and his friend Jerome of Prague, who were burnt at Constance in 1415, was considered by him as an insult to his faith and his country. His hatred of the Roman Catholic clergy was increased when his favourite sister was seduced by a monk. He became conspicuous among those Bohemian nobles who urged King Wenceslaus to revenge the insult, and to protect the followers of Huss against the decisions of the synod of Constance. The king, seeing him one day from the window of his palace walking in a thoughtful mood, asked him what he was meditating upon. 'Upon the Word of Your Majesty,' answered Zizka, 'which the Bohemians have suffered at Constance.' "It is true," replied the king, "that we have been insulted, but I fear it is neither in my nor in your power to revenge it. If you can do so, I give you my royal permission." It is said that this circumstance first inspired Zizka with the resolution of defending with his sword the religious liberties of his country. But Wenceslaus was a man of so little steadiness and energy, that he was alarmed at his own resolves, and his perplexity was augmented when he was informed that the Bohemian nobles had resolved to take up arms in defence of the dignity of his own person. Their leader was Nicholas of Hussynecz, and Zizka was among them. They did not venture to appear before the king though they acted with his permission. Zizka however persuaded them to follow him, and having been received by the king, spoke to him to this effect:—"Sire, behold a body of your majesty's faithful subjects. We have brought our arms, as you commanded. Show us your enemies, and you shall acknowledge that our weapons can be in no hands more useful to you than in those which hold them." "Take your arms," replied the king, after a moment's hesitation, "and use them properly." Zizka's conduct on this occasion recommended him to the confidence of his party. But the king's energy was not real; he did not protect the followers of Huss; and the Roman Catholic party became still more insolent. On the 30th of July 1419, there was a public procession at Prague, and some quarrel having broken out between the Roman Catholics and the Hussites, a Hussite priest was wounded by a stone thrown by a Roman Catholic. The discontent of the Hussites now burst out, and, as the government of the town was in the hands of the Roman Catholics, they proceeded to the town-hall, where the magistrates were assembled, and, led by Zizka, stormed it, and threw thirteen aldermen from the windows into the court-yard, where they were torn in pieces by the mob. When Wenceslaus was informed of it, he fell into a fit of passion and died. (Wenceslaus.) This was the beginning of the Hussite war, the first great religious contest that desolated Germany. Zizka was proclaimed commander-in-chief by the Hussites, and he found no opposition to his authority.

Siegmund, king of Hungary and emperor of Germany, considered himself as the lawful successor of his brother Wenceslaus in Bohemia; but the Hussites, who knew the emperor's character, and had not forgiven him his faithless conduct towards Huss, did not acknowledge his title. They resolved to exclude him from the throne, they prepared for resistance, and protected the doctrines of Huss throughout the kingdom. In 1420 Siegmund entered Bohemia at the head of 40,000

Digitized by Google

men, and Pope Martin V. endeavoured to increase his adherents by preaching a crusade against the Hussites. Encouraged by some advantages over Zizka, the emperor behaved with cruelty to the Hussite priests, who were burnt alive by his order wherever they fell into the hands of the Imperialists. But the party of the Hussites grew daily more dangerous, and Zizka not only disciplined their troops, but secured them against sudden attacks by building fortresses in proper situations. His principal fortification was near Bechin. A short distance from this town the Moldau winds round a craggy hill, and forms a spacious peninsula, the neck of which is scarcely forty feet wide, and on that side only is the peninsula accessible. The hill was fortified with great skill, and a strong body of Hussites encamped there in tents; but the tents soon became houses, in the midst of which stood the palace of Zizka. Some of the hill was dug into, and hid and hence the Hussites called themselves Taborites, by which name they afterwards distinguished themselves from some sects which sprung up among them, as the Calixtines, the Orebites, and the Orphanites. Zizka began his victories with the conquest of Prague, except the castle; and he took up a fortified position on Mount Witkow in order to protect the town against Siegmund, who approached with 30,000 men: Zizka had only 4000. When he was attacked, on the 14th of July 1420, he not only drove the Imperialists back, but entirely routed them. That mountain is still called the Zizka-mountain. The emperor having been obliged to retreat from Bohemia, Zizka laid siege to the castle of Prague, which he took in 1421, and there found five cannons, the first which he had in his army. But he soon increased his artillery, and he procured a great quantity of small fire-arms, which had hitherto been very little used in warfare. He gave fire-arms to a considerable part of his army, and from this time they gradually became the common arms of the infantry of all nations. Zizka was also very deficient in cavalry, and, in order to protect his infantry against the attacks of cavalry, he invented, or rather introduced again, an ancient kind of barricade, consisting of large carts, which he called by the German name of 'Wagenburg' (cart-fort). These were not the sole inventions of Zizka, whose name will ever be conspicuous, not only as a general, but also as an engineer. In the same year (1421) Zizka lost his other eye by an arrow during the siege of the castle of Raby; but he nevertheless continued to lead his troops, in front of whom he was carried in a cart, and he arranged the order of battle according to the description of the ground made by his officers. In this difficult business he was greatly supported by his excellent memory and his complete geographical knowledge of Bohemia. Meanwhile Siegmund had levied a new army in Germany, the flower of which was a body of 15,000 Hungarian horse, who were considered the best in Europe, and were commanded by an Italian officer of great experience. A pitched battle was fought on the 18th of January 1422. His Hussite speak of the number of Zizka's troops as a number beyond all credibility, and it appears that they have not exaggerated it. The imperial infantry made no stand at all, and the horse took to flight after a feeble resistance: they were beaten by terror rather than by the sword. They retreated towards Moldau, and were so hard pressed by Zizka that they crossed the frozen Igla in large bodies, and, as the ice broke, about 2000 of them were drowned. In the same year Zizka obtained a decisive victory at Aussig, over a Saxon army commanded by the Electors of Saxony and Brandenburg. The Saxons however were excellent soldiers, and on their first onset the Hussites were so well received that they retired in confusion, and then stood still facing their enemy with silent amazement. They had never met with such resistance, and they believed that nobody could resist them. Upon this Zizka approached on his cart and said:— "Well, my brethren, I thank you for all your past services: if you have now done your utmost, let us retire." This noble rebuke roused their fanatical courage, and in a second attack the Saxons were routed and left 9000 dead on the field. Siegmund now saw that he could never conquer Bohemia, and he proposed an arrangement, to which he was the more inclined as some of the Bohemian states had offered the crown to Witold, grand-duke of Lithuania, who accepted it, and sent Prince Korybut to Prague as his viceroy. But Korybut, being only supported by part of the Hussites, could not maintain himself, and was compelled to return to Lithuania. On the other hand there were good reasons for Zizka making peace, for although his own authority was never shaken, the animosity between the minor sects of the Hussites was too great to allow the prospect of a lasting political union among them. Siegmund promised to grant full religious liberty to the Hussites, and to appoint Zizka governor of Bohemia and her dependencies, with great power and privileges. But Zizka did not live to complete the treaty, which was ready to be concluded after an interview had taken place between him and the emperor, with whom the blind general treated on terms of equality and with the confidence of a sovereign king. Hostilities were continued during the negociations: Zizka laid siege to the castle of Przibislaw, in the district of Czaslau; and a kind of plague having broken out, he was seized, and died on the 12th of October 1424. Zizka was victorious in thirteen pitched battles and more than one hundred engagements and sieges: he was only once beaten in the open field, at Kremeir in Moravia; but he retreated in such good order that his defeat was not followed by any bad consequences for him.

The only stain on his character was his cruelty. He believed himself the instrument of divine vengeance, and he called the cries and lamentations of the monks and priests who were burnt by his order the hridal song of his sister. He was buried in a church at Czaslau, and his iron war-club, with which he is represented in many engravings, was hung up over his tomb. When the Emperor Ferdinand I. went to Czaslau, in 1554, and saw the tomb, he asked who was buried there, and being informed that it was Zizka, he cried out in Latin, "Pbui, pbui, mala bestia, quæ mortua etiam post centum annos terret vivos!" (Lo, the wicked beast, one hundred years dead, and still frightens the living!) The emperor it is said was so frightened that he left the church immediately, and would not stay the night at Czaslau, but proceeded on his journey: but it may be believed that he had some better reasons for continuing his journey than dread of the long buried Zizka. There is another idle tale that Zizka on his death bed ordered his skin to be tanned, and put over a drum in order to frighten his enemies after death; and it is also said that the Hussites used that drum in many a battle: all this is fabulous.

After Zizka's death the negociations with the emperor were broken off: the Taborites chose Procop the Holy for their leader; the Orebites, Krussina; and the Orphanites, Procop the Little, who continued that awful war for eleven years more, till it was finished by the treaty of Prague, in 1435, in consequence of which Siegmund was acknowledged king of Bohemia.

(Millauer, *Diplomatisch-historische Aufsätze über Johann Zizka von Trocznow*, Prague, 1824; Koelerus, *Eulogium Joh. de Trocznow cognomento Zizkæ*, Göttingen, 1742; *The Life of Zizka*, in Gilpin, *The Lives of John Wiclef and of the most eminent of his Disciples, Lord Cobham, John Huss, Jerome of Prague, and Zizka.*)

ZOBEL, BENJAMIN, was born in 1702, at Memmingen in Bavaria. He received his education at the government school of that city, and acquired the rudiments of drawing from one of the monks belonging to the convent of Ottobeuren. In 1731 he went to Amsterdam, where he resided for two years, occupying himself chiefly in portrait-painting. In 1733 he came to London, where he formed acquaintance with Morland and Schweickhardt, the latter of whom was employed at Windsor Castle by George III.'s 'table-decker.' It was then the custom to ornament the royal dining-table by having a silver plateau extending along the centre, on which were strewed various coloured sands or marble dust, in fanciful designs of fruit, flowers, arabesque-work, &c. For this an artist of some talent and great freedom of hand was required. On the retirement of Schweickhardt, Zobel was appointed to succeed him, and he continued to fill the office for a considerable period. Ornamenting the royal table in the manner just described was a daily occupation, the sands not being cemented by any substance. From this occupation arose the idea in the mind of Zobel of producing a finished and permanent picture, by the use of some substance by which the sands might be fixed. After various experiments, a composition (in which gum-arabic and spirits of wine formed the chief ingredients) was found to answer the best. The subject of the picture having been designed either on pannel or milled board, a coating of the glutinous substance was applied over it; the different coloured sands were then used in a similar manner as that employed in decking the royal table, viz., by strewing them from a piece of card held at various elevations, according to the strength or softness of the tint required. Thus was formed a picture, not subject to decay, and permanent in all its parts, and this was called by the inventor, Marmotinto. Some of the best specimens of this peculiar art were formerly in the possession of the late Duke of York, but were sold, at his death, at Oatlands. Several are still among the collections of paintings belonging to the Duke of Northumberland and Sir Willoughby Gordon. Painting on gold and silver grounds in transparent colours for the representation of cabinets of humming-birds, &c., was also practised with eminent success by Zobel. He died in 1831.

ZOËGA, GEORG, was the eldest of the three sons of a Lutheran clergyman of Jutland, said to have been of Italian descent, and was born the 25th of December 1755, at the village of Dahlen in the county of Schackenburg and the diocese of Ripen, where his father was then minister, although he soon after removed to the parish of Mogelton-dern, near the town of Tondern in the same county. After having been carefully educated at home, under the eye of his father, Zoëga was sent, in 1772, to the gymnasium of Altona, whence the next year he proceeded to the university of Göttingen.

On finishing his academic course, in 1776, Zoëga set out on a tour through Germany and Switzerland, which he was eventually led to extend to Italy, and he did not return to his native country till he had visited both Venice and Rome. He then passed a winter at the university of Leipzig; after returning home from which he spent some time in the office of a brother of his father, who held a post under the government at Copenhagen; but at last, in October 1778, he accepted the situation of a family tutor in the little town of Kierteminde, on the eastern coast of the isle of Fünen. After a few months however he was offered the appointment of travelling tutor to a young gentleman who proposed to make the tour of Germany, Italy, France and England; this scheme exactly suited the taste of Zoëga, who was already devoted to the study of the fine arts. After a year's residence with his pupil at Göttingen, where he renewed his intimacy with his old professor Heyne, with whom he had been always a favourite, they set out together in March 1780, and after

having visited Cassel and Frankfort, and traversed Hesse, the Palatinate, Suabia, and Bavaria, went down the Danube to Vienna, and thence crossed the Tyrol and Carinthia to Venice, whence they proceeded through Lombardy and Tuscany to Rome, and from Rome to Naples. Returning to Rome, they spent two months more in that city; and then, in May 1781, were about to take their departure, by the way of Milan and Turin, for France, when an unexpected death suddenly recalled them to Denmark.

Soon after his return home Zoëga was introduced to the Danish minister Guldberg, who, struck with his merit, appointed him to make a museum tour at the charge of the king in Germany and Italy. Upon this enterprise he set out in April 1782; and after spending six months in the Imperial Museum at Vienna, he arrived once more at Rome, in January 1783. From this date Italy, and chiefly Rome, continued, with the exception of a short visit which he made to Paris in 1784, to be the residence of Zoëga to the end of his life. The sudden death of his patron Guldberg, the news of which reached him while he was at Paris, in May 1784, reduced him for a time to great straits; and his difficulties were made the more serious by his having some time before married a young Italian lady, Maria Pietrucioli, the beautiful but penniless daughter of a painter, and become a convert to popery. He had however on the introduction of the Austrian papal nuncio Garompi, whose acquaintance he had made at Vienna, been received with distinguished favour by the celebrated Stefano Borgia, then secretary to the Propaganda College, afterwards cardinal; and he soon, through Borgia's interest, received from the pope the appointment of interpreter of modern languages to the Propaganda College. He was engaged in the preparation of a critical catalogue of the series of Egyptian coins struck by the Roman emperors, mostly as contained in the rich museum of Borgia at Velletri, which was at last published in 4to at Rome, in 1787, with the title of 'Numi Ægyptii Imperatorii prostrantes in Museo Borgiano Velitris, adjectis præterea quotquot reliqua hujus classis numismata ex variis museis atque libris adhiberi obligit.' This work attracted great attention, and soon made the name of Zoëga known throughout Europe. It was followed by his greatest work, his treatise on Obeliska, prepared at the desire of Pope Pius VI., and the printing of which, after it had been going on for five years, was at last completed in 1797. But after the labours and anxieties of so many years, which pressed the more heavily upon Zoëga inasmuch as he had to contend at the same time with many other distractions and vexations, straitened circumstances, frequent attacks of illness, the still worse health of his wife, and the death of his children, eight of whom, out of only six and eleven, he is stated to have lost in eighteen years, the publication of the work was for a time prevented by the hurricane of the French revolution which had already swept the north of Italy, and in the beginning of 1798 enveloped Rome, throwing down or scattering pope and cardinals, wresting from the librarians and museum many of their most precious treasures, threatening in short to break up the whole system of things in which the great archæologist lived and moved and had his being. At first Zoëga thought of taking flight, as his patron Cardinal Borgia had done; but, much ill as he probably foresaw destruction, he remained till the French liberating army, as it called itself, made its entry; and then, caught for the moment by the prevailing contagion, he joined in hailing what seemed to his excited imagination, and that of many others, the resurrection of old Roman freedom. But this enthusiasm did not last long; after a few months he is found in his letters expressing his repentant regret for having ever for an instant approached what he calls the popular volcano. Meanwhile he had been appointed a member of the newly established Roman National Institute, with the other most eminent of the Italian men of letters; and he afterwards read several learned discourses before this body. At last, in 1800, after the return of his friend Cardinal Borgia with the new pope, Pius VII., the treatise on Obeliska appeared in a magnificent folio volume, bearing the date of 1797, and the title of 'De Origine et Usu Obeliscorum; ad Pium Sextum Pontificem Maximum, auctore Georgio Zoëga.' A thousand copies were printed. This may probably be considered as the earliest modern work upon the subject of Egyptian antiquities which still retains any value, and as the foundation and commencement of all the sound investigation which that department of archæology has yet received.

Zoëga now, broken down by infirmities, though as yet only in his forty-fifth year, and having secured no provision for his family, began to turn his eyes to his native country; and with his great reputation he found little difficulty in obtaining from the king of Denmark an appointment to a professorship in the University of Kiel. This arrangement was made in the beginning of 1802; but in fact, he could not bring himself to leave Rome, and at last, in 1804, after he had repeatedly obtained leave to postpone his departure on various grounds, he was permitted to remain where he was, with the title of professor and the same advantages which he would have had at Kiel, retaining at the same time the appointment of agent to his Danish majesty, which he had held for some years past. His salary altogether is stated to have amounted to 900 crowns; but then it was paid in paper, and the Danish paper money at this time, and still more at a later date, was much depreciated. Zoëga's next work was a catalogue of the Coptic Manuscripts in the library of Cardinal Borgia: 'Catalogus Codicum Copticorum Manu Scriptorum qui in Museo Borgiano Velitris asservantur: auctore Georgio Zoëga, Dano, Equite Aurato ordinis Danebrogici, fol., Rome, Typis Sacræ Congregationis de Propaganda Fide.' The whole of this work, with the exception only of three pages of corrigenda, was printed in 1805, but the sudden death of Cardinal Borgia, which took place at Lyon in the end of 1804, and the embarrassment into which Zoëga was thrown by that event, which involved him in a law-suit with the heirs of the cardinal and the Propaganda College about the expenses of carrying the book through the press, prevented it from being published till 1810, after his decease, when the case was decided in favour of his children. Meanwhile he had commenced, in conjunction with Tirnesi and the engraver Piroli, an account of the antique bas-reliefs existing at Rome—'Bassirilievi Antichi di Roma,' the first 4to volume of which, published in numbers, was completed in May 1808; a second volume was carried on for some number of years by Zoëga without the assistance of Piranesi, but was left unfinished at his death, which took place on the 10th of February 1809. Eight days after his death the announcement was received by his family of his having been appointed by the king of Denmark a knight of the order of Dannebrog. A German translation of his last work, in 2 vols. small folio, (one of letter-press, one of plates), was published at Giessen in 1811-12, by F. G. Welcker, then professor of Greek in the university there, with the title of 'Die Antiken Bas-reliefe von Rom. In den originalkupferstichen von Tomaso Piroli in Rom, mit den Erklärungen von Georg Zoëga. Uebersetzt, und mit Anmerkungen begleitet, von F. Gr. Welcker,' &c. In 1817 Welcker published an 8vo volume of detached dissertations by Zoëga; and in 1819 a collection of his Letters, in 2 vols., in German, with a memoir of his Life.

(Füssli, *Künstler-Lexicon*; Nagler, *Allgemeines Künstler-Lexicon*.)

ZOFFANY, JOHANN, R.A., distinguished painter of the latter part of the 18th century, was by descent a Bohemian, but his father, who was an architect, had settled in Germany. Johann Zoffany was born, according to Fiorillo, at Regensburg in Bavaria, or, according to another account, at Frankfort on the Main in 1735: the latter probably is the correct account. Young Zoffany showed early by his father to Italy, where he studied some years. After his return to Germany he practised some time as an historical and portrait painter at Coblenz on the Rhine, from which place he came to England a few years before the foundation of the Royal Academy, for he was elected one of its first members in 1768. In England Sir Joshua Reynolds and Garrick became valuable patrons to him, and his first pictures which attracted notice in London were a portrait of the Earl of Barrymore and some theatrical portraits. He painted Garrick in Sir John Hote, and as 'Abel Drugger' in Ben Jonson's 'Alchymist;' Foote, as Sir Luke, in the 'Mayor of Garret;' Weston and Foote in Dr. Last; and Garrick in the 'Farmer's Return,' in which the character and drawing are very good: the colouring is less successful.

In 1771 Zoffany painted the royal family on a large canvas, to the number of seventeen portraits, of which there is a mezzotinto by Earlom. He painted likewise two separate portraits of George III. and his queen, which were engraved in mezzotinto by Houston. Shortly after this time he revisited Italy, and took a recommendation from Horace Walpole to the Grand Duke of Tuscany at Florence, where he painted an interior view of the Florentine picture-gallery, which was purchased by George III. In 1774 he painted a clever picture of the 'Life-school' of the Royal Academy, in which he introduced two naked models and thirty-six portraits; it has been engraved in mezzotinto by Earlom. In 1781 or 1782 Zoffany went to the East Indies, and lived some years at Lucknow, where he met with the greatest success, and he painted three of his best works there, all of which have been well engraved in mezzotinto by Earlom. One is the Embassy of Hyderbeck to Calcutta, who was sent by the Nabob of Oude to Lord Cornwallis; he went with a numerous retinue by Patna to Calcutta: the picture is a rich display of Indian costume, and contains, besides about 100 figures, several elephants and horses; the scene is placed in Patna. The others are an Indian Tiger-Hunt, and a party companion to the Embassy, a Cock-Fight, at which there are many spectators.

Zoffany returned to London about 1796 with a large fortune, and died at Kew in 1810.

(Fiorillo, *Geschichte der Mahlerey, &c.*; Pilkington, *Dictionary of Painters.*)

ZOʻILUS (Ζώϊλος), a Greek rhetorician and grammarian, is called by some a native of Ephesus (Scholiast ad 'Hom. Iliad,' v. 7), though the majority of ancients describe him as a native of Amphipolis on the Strymon, whence Heraclides Ponticus calls him a Thracian. (Ælian, 'Var. Hist.,' xi. 10; Suidas; Heraclid. Pont., 'Allegoriæ Homericæ,' p. 424.) Ælian describes Zoilus as a pupil of Polycrates, who wrote an accusation of Socrates, and seems to have lived about B.C. 390. Vitruvius ('Præfat.,' lib. vii.), on the other hand, makes him a contemporary of Ptolemy Philadelphus, B.C. 283–247. Suidas (s. v. Ἀναξιμένης) states that Anaximenes of Lampsacus was a pupil of Zoilus, and we know that this Anaximenes must have lived shortly after the time of Alexander the Great. These different statements of the age at which Zoilus lived do not allow us to draw any more definite conclusion than that he must have lived during the period that followed the death of Philip of Macedonia, that is, after B.C. 336, for we know that he wrote a history which came down to the death of that king. Some modern scholars have had recourse to the usual expedient in such cases,

Digitized by Google

namely, to suppose that there were two persons of the name of Zoilus —the one a grammarian who attacked Homer, and the other a rhetorician, though a careful examination of the passages in which Zoilus is mentioned leaves no doubt that they all refer to the same person. We have thus no alternative except to suppose that some of the ancients fixed the date of Zoilus incorrectly. From Herschles Pontieus it appears that Zoilus was originally a slave, but he afterwards acquired great reputation as a rhetorician. He was notorious for the bitterness and severity of his attacks, whence he was nicknamed 'the rhetorical dog' (κύων ῥητορικός). He attacked Homer for introducing fabulous and incredible stories in his poems, and also Plato and Isocrates. (Scholiast ad 'Hom. Iliad.,' v. 7, 20, &c ; Longinus, 'De Sublim.,' ix. 14; Scholiast ad 'Plat. Hipparch.,' p. 240; Dionys. Hal., 'Demosth.,' 8; 'Isaeus,' 20.) For this reason his name appears to have become proverbial for a detractor in general. (Ovid, 'Remed. Amor.,' 366.) But Dionysius of Halicarnassus ('Epist. ad Pomp.,' c. 1) gives him the honourable testimony of having attacked no one except in defence of what he considered the truth, and he places him by the side of Aristotle and other great men. The story of his having been ill-used by Ptolemy Philadelphus for having censured Homer, and of his miserable death, of which three traditions are enumerated by Vitruvius, is probably a mere fable; and the account of Suidas, that he was killed at Olympia by the assembled Greeks for his hostility towards Homer, deserves just as little credit. The following works of Zoilus are mentioned by Suidas and others :—1, a work in nine books against the poetry of Homer (Suidas; Dionys. Hal., 'Isaeus,' 20); 2, an oration against Homer, Ὑπὲρ Ὁμήρου (Suidas); 3, an historical work in three books, beginning with the theogony and ending with the death of Philip of Macedonia (Suidas); 4, a work on Thrace (Stephanus (Suidas); 5, an encomium on the inhabitants of Tenedos (Strabo, vi. p. 271); and 6, a work on the figures of speech, of which a fragment is still extant (Phoebammon, 'De Figuris,' p. 538, ed. Aldus; comp. Quintilian, ix. 1, § 14).

(Fabricius, *Biblioth. Graec.*, i., p. 560, &c.; Wolf, *Prolegom. ad Homer.*, p. 192; Vossius, *De Hist. Graecis*, p. 130, &c., ed. Westermann.)

ZOLLIKOFER, GEORG JOACHIM, one of the greatest German pulpit orators of the 18th century, was born on the 5th of August 1730, at St. Gallen in Switzerland. His early education was conducted by his father, a distinguished and respected lawyer; and after having for some time attended the public school of his native place, young Zollikofer was sent to the gymnasia of Frankfurt-on-the-Main and of Bremen. When he had completed his preparatory courses, he went to the University of Utrecht, where he studied chiefly theology, but devoted also much time to the study of the ancients, of philosophy, and belles-lettres. Soon after his return to Switzerland he was appointed, in 1754, pastor at Murten in the Pays de Vaud, but he did not remain there long. After having successively been removed to Monsheim and Isenburg, he settled, in 1758, to the office of pastor of the Reformed (Calvinistic) congregation at Leipzig. In this place he continued until his death, on the 25th of January 1788, although several very honourable offers were made to him. His position at Leipzig was particularly favourable, for a congregation was soon formed enlightened in Germany, and his intercourse with the distinguished professors of the university had a great influence on the development of his talent as a pulpit orator. He also exerted a very beneficial influence not only upon his congregation, but upon the young theologians of Leipzig, to whom his upright and pious conduct was a model of what a pastor should be. His knowledge, though very extensive, was not always profound, and he attached a higher value to the practical part of religion than to learning and theological speculation. He taught his flock by word and example the practical influence which Christianity should have upon their conduct. His method of preaching was calm and dignified, impressive and convincing, without being rhetorical. Although his sermons were not exactly what we call popular, they were always clear and lucid, and won their way to the heart through the understanding. He counteracted the prevailing prejudices and evils of the time, and endeavoured to correct the vulgar notions of morality, and to enlighten his audience in the true sense of the word. What rendered his influence as a teacher the more efficacious was, the fact that his own life was a perfect exemplar of what he taught. As regards his doctrinal views, he did not hesitate to attack the common opinions where he thought them incompatible with reason and good sense; and, although he was not a neologian, yet he differed in several points from the common Calvinistic views. The best of his sermons, amounting to about 250, were published and received with great favour, and they are still much read in Germany. Zollikofer himself published several collections of them: one at Leipzig, in 1769-71, in 3 vols. 8vo; a second in 1784, 2 vols. 8vo, reprinted in 1790 and 1795; and a third in 1787, 4 vols. of which a third edition appeared in 1793. After his death a collection of unpublished sermons was edited by F. Ven Blankenburg, in 7 vols. 8vo, Leipzig, 1788–89, to which two more volumes were added by J. G. Marezoll, 8vo, Leipzig, 1804. About the same time there appeared a complete collection of all Zollikofer's sermons, in 15 vols. 8vo, Leipzig, 1789-1804. Besides these sermons, he published—1, a new Hymn-book for the use of the Reformed Churches, 8vo, Leipzig, 1766; some of the hymns are of his own composition, and the great popularity of them is manifest from an eighth edition being published in 1789, 8vo. 2, 'Abhandlung über die Erziehung,' 8vo, Leipzig, 1783. 3, 'Anreden und Gebete zum Gebrauch bei dem gemeinschaftlichen und auch dem häuslichen Gottesdienste,' 8vo, Leipzig, 1777, reprinted in 1785. 4, 'Andachtsübungen und Gebete zum Privatgebrauch für nachdenkende und gutgesinnte Christen,' 2 vols. 8vo, Leipzig, 1785. A third and fourth volumes appeared after his death, in 1792 and 1793, and a new edition of the two last volumes in 1802, &c. Zollikofer also translated several works from the French and English, with which languages he was thoroughly conversant. From the English he translated P. Brydone's 'Travels in Sicily and Malta,' of which a third edition appeared at Leipzig in 1781. Zollikofer's sermons were translated into English by William Tooke, 10 vols. 8vo.

(C. Garve, *Ueber den Charakter Zollikofer's*, 8vo, Leipzig, 1788; Jördens, *Lexikon Deutscher Dichter und Prosaisten*, v. pp. 659-693.)

ZONA'RAS, JOANNES, a Greek historian and theologian of the 12th century of the Christian era. He was a native of Constantinople, and lived in the reign of the Emperor Alexius Comnenus. He was at first invested with the high office of præfect of the emperor's bodyguards, and that of protosecretis (πρωτοασηκρῆτις), but he afterwards entered a monastery. During this last period of his life, which falls in the reign of Joannes Comnenus, he devoted himself entirely to literary pursuits, and produced several great works, partly historical and partly theological. He is said to have died on Mount Athos, at the age of eighty-eight. He is spoken of by his contemporaries, as well as by subsequent writers, in terms of the highest praise, both as a man and a philosopher. We subjoin a list of those of his works which have been printed, and begin with the most important :—1, Χρονικὸν, or annals from the creation of the world down to the death of Alexius Comnenus, 1118, at which point Acominatus Nicetas takes up the history. This work is divided into two great parts, and subdivided into eighteen books. It is a compilation from the earlier Greek historians, whose statements are sometimes only transcribed and sometimes abridged, so that the work is a substitute for many others which have perished. The 'Annals' of Zonaras were first edited by H. Wolf, with a Latin translation by A. Fogger (3 vols. folio, Basel, 1557). This edition was followed by a much better one by Du Fresne du Cange (2 vols. folio, Paris, 1686, &c.), with an improved Latin translation and notes. A reprint of this edition is contained in the Venice collection of the Byzantine writers of 1729, &c., in 23 vols. folio. In the Bonn collection of the Byzantine writers Zonaras is edited by Pinder. 2, Ἐξήγησις τῶν ἱερῶν καὶ θείων κανόνων, &c., that is, an exposition of the sacred canons and those of the ecumenical councils, synods, and ecclesiastical fathers. The commentary on the canons of the apostles was edited in a Latin translation by J. Quintinus (Paris, 1558), and that on the councils and fathers, likewise in a Latin translation, by A. Salmatia, (Milan, 1613). The Greek original of the latter, with the Latin version, was published at Paris in 1618, folio. The whole of Zonaras' commentaries, both in Greek and Latin, was edited by G. Benergius (folio, Oxford, 1672). 3, Λόγος περὶ τοῦ τὴν φυσικὴν τῆς γονῆς ἐκροὴν μίαμια ἐγγυᾶσθαι. It is published in E. Bonefidius's 'Jus Orientale,' iii. 261, &c, both in Latin and Greek, and also in Leunclavius and Freher's 'Jus Graeco-Romanum,' i. 351, &c. 4, Περὶ τοῦ κρατεῖσθαι τὸν ἄρχοντα περὶ τοῦ μὴ δεῖν διεζεῦχθαι τὴν αὐτὴν ἀγαγέσθαι πρὸς γάμον: that is, a treatise to show that two nephews should not be allowed to marry the same woman. It is printed in Latin and Greek in Cotelerius's 'Monumenta Ecclesiae Graecae,' ii. 485, &c. There are several other works of Zonaras, and among them several homilies and letters which have not yet been printed, or only in a fragmentary way: a complete list of them is given by Fabricius.

(*Biblioth. Graec.*, xi., p. 222, &c.; vii., p. 465, &c.: compare Cave, *Historia Literaria*, i., p. 646, &c.)

ZOROASTER, or ZERDUSHT, the founder of the religion of the Parsees, was born about n.c. 589, at Urmia, a town of Aszerbijan, in the reign of Lohrasp, the father of Gushtasp (the Darius Hystaspes of the Greeks). His parents were in an humble condition, although of a noble family, and some of the Eastern authorities trace the lineage of his father, Purushasp, to Feridoon. Daghda (Anquetil writes Dogdo), the mother of Zoroaster, is also said to have been of princely birth, and it is needless to observe that her life is reported to have been so spotless as to attract the favour of the Deity, who foretold to her the greatness of Zoroaster while yet in the womb, through the medium of magic dreams. Nor is it necessary to state that the birth of the Persian prophet was attended with many miraculous circumstances calculated to make the persons who saw it adopt and spread the belief in the divine mission of the new-born infant. Many of these miracles have found their way into classical writings, and Pliny mentions that Zoroaster laughed on the day on which he was born, and that his brain palpitated so violently as to repel the hand when placed on it. ('Hist. Nat.' vii., c. 16; H. Lord's 'Religion of the Modern Parsees in India,' c. 3.) Miracles of this kind are by Eastern authors always made to precede the life of a remarkable man, and they serve to show the high influence which Zoroaster obtained throughout life, and the respect which posterity paid to his memory. The years of Zoroaster's childhood quietly passed in his native town—although his historians delight in adorning them with the most extravagant accounts of his exploits when a child. However, he must have soon turned his attention to the study of nature, as it is stated that

Digitized by Google

he passed twenty years in the deep caves of the mountain Elbrooz (Pliny mentions this with a slight alteration, 'Hist. Nat.,' xi. c. 42) before he went to the court of Gushtasp, at which period he is said to have been only thirty years of age (Hyde, p. 330, on the authority of Shahristani). His having secluded himself from the society of men for a great number of years, is a fact corroborated by many independent authorities. It was in this retirement that the will of the Supreme Being was made known to him, and as this portion of Zoroaster's life is the one upon which the Parsees rest most of the evidence of the truth of his divine mission, we shall relate it according to the Zerdusht-nameh. It must be observed that Zoroaster's journey to the mountain Elbrooz is by the Parsee authors invariably called the prophet's journey to heaven, where he received his instructions from Ormuzd (*i. e.* the Zend-Avesta and the sacred fire). Then (says the Zerdusht-nameh, c. 22) Bahman, radiant like the sun, and with his head covered by a veil, appeared before Zoroaster, by the command of Ormuzd, and said, "Who art thou? What dost thou want?" Zoroaster answered, "I seek only what is agreeable to Ormuzd, who has created the two worlds, but I know not what he wants with me. O Thou, who art pure, show me the way of the law." These words pleased Bahman. "Rise," said he, "to go before God; there thou shalt receive the answer to thy request." Zoroaster rose and followed Bahman, who said, "Shut thine eyes, and walk swiftly." When Zoroaster opened his eyes, he saw the glory of heaven; the angels came to meet him, and with them he approached Ormuzd, to whom he addressed his prayer. From him and the other six Amshaspands (or heavenly ministers) he received the following instructions; Ormuzd himself said to Zoroaster, "Teach the nations that my light is hidden under all that shines. Whenever you turn your face towards the light, and you follow my command, Ashman (the spirit of light) will be seen to fly. In this world there is nothing superior to light." He then handed to him the Zend-Avesta with the injunction to declare it before Gushtasp. Bahman, the Amshaspand presiding over the animals, surrendered his office to Zoroaster, and gave him the necessary directions. Ardibehesht, Shahrevar, Isfendarmaz, Khordad, and Amerdad followed the example of Bahman, and Zoroaster returned to the world to overthrow the false doctrines which were upheld by magicians and had brought misery upon mankind. This fanciful story, which is gravely related by most of the authors on the life of Zoroaster, was evidently invented for the purpose of filling up the chasm which the twenty years of seclusion would have left.

Zoroaster first saw Gushtasp at Balkh, and he soon led this prince to become a zealous and powerful propagator of his faith. The Zinat-al-Tawarikh states that Asfandiyar, the son of Gushtasp, was the first convert of Zoroaster; and that his father was persuaded by the eloquence of his son to follow his example. However, the new doctrine, which Zoroaster said had been revealed to him from above, spread rapidly in the province of Azerbijan (*i. e.* 'the house of fire'). Gushtasp introduced it into every part of his dominions, and ordered 12,000 cow-hides to be tanned fine that the precepts of his new faith might be written on them. These parchments were deposited in a vault hewn out of a rock in Persepolis. He appointed holy men to guard them; and it was commanded that the profane should be kept at a distance from the sacred book (Malcolm, i. p. 45). The powerful protection of the king enabled Zoroaster to introduce his doctrine farther than the kingdom of Iran; we bear of his journeys into Chaldæa, and that Pashuran, the second son of Gushtasp, was sent by him into Varjemgherd in order to propagate his new religion. He also tried to gain proselytes in India, and succeeded in converting a learned Brahmin (Tchengrighatchah, according to Anquetil, vol. i.. c. 2, p. 70), who went back into his native country with a great number of priests. Temples of Fire, or Ateshi-gahs, were erected in all parts of the empire at the expense of Gushtasp, whose zeal in imposing the Zend-Avesta not only on his own subjects, but also on those of the neighbouring monarchs, at last engaged him in a war with Arjasp, king of Turan. Zoroaster was undoubtedly the chief instigator of this war, which was protracted beyond his life-time, and finally ended in a victory gained by Asfandiyar over the Turanians, who, in the exultation of a first success, had determined on putting to death all the followers of Zoroaster. The prophet died in the year B.C. 513, about seventy-six years of age, a few months before the general massacre of the fire-worshippers had been resolved upon by Arjasp. Some authorities quoted by Hyde, pp. 323 and 329, say that he was murdered during the persecution.

The whole history of Zoroaster, when divested of all extraneous matter, can be reduced to the following statement:—The ancient religion which Djamshid had established in Iran had become merely traditional and lost its influence over the nation; new sects had sprung up in every direction; Hindoos and Chaldæans were endeavouring to introduce their own religion, when Zoroaster appeared. It is evident that the worship of elements had been established in his native province, before he produced his great reform in the adjacent empire; he therefore seems to have restored the religion of his ancestors to a state of greater purity and adapted it to the exigencies of the nation where he was the first to promulgate it.

What we have said hitherto rests entirely on the authority of Eastern authors—it has no claim to historical accuracy; but it contains more than can be gathered from classical writers. The Life of Zoroaster, prefixed to Anquetil du Perron's Zend-Avesta, is a compendium of all the extravagant stories which have been invented about Zoroaster.

From the different dates assigned to Zoroaster by Greek and Latin authors, many modern authors were led to believe that there were no less than six men of that name; but this opinion has been satisfactorily refuted by Hyde, in his 'Veterum Persarum et Majorum Religionis Historia;' and lately by Pastoret, in his 'Zoroastre, Confucius, et Mahomet comparés.' For an ingenious endeavour to prove that there were more than one Zoroaster we refer to Stanley's 'Historia Philosophiæ' (Pars xiii., Sect. 1, c. 3); and to Bryant's 'Analysis of Ancient Mythology,' vol. ii., p. 388, where almost all the passages that can be found in ancient authors relating to Zoroaster are very carefully put together.

Again, there were writers who identified Zoroaster with Moses. Among whom Huet is the most prominent ('Demonstratio Evangelica,' Prop. iv., c. 5); others again have supposed that Zoroaster was born in Palestine, or that he passed his early youth in that country and earned his subsistance by becoming a servant to a Jewish prophet (Hyde, p. 316). Abul-faraj states his prophet to have been Elijah, Hyde thought he was Ezekiel, while Prideaux conjectures that Zoroaster had been servant to Ezekiel. It is scarcely necessary to observe that these conjectures are utterly vain and quite useless. There was only one Zoroaster or Zerdusht, who lived in the time of Gushtasp and founded the great reform.

The leading doctrines propagated by Zoroaster were the following:—He taught that God existed from all eternity, and was like infinity of time and space. There were, he averred, two principles in the universe—good and evil; the one was termed Ormuzd, or the good principle, the ruling presiding agent of all good; the other, Ahriman, lord of evil. Each of these had the power of creation, but that power was exercised with opposite designs; and it was from their united action that an admixture of good and evil was found in every created thing. The angels of Ormuzd sought to preserve the elements, the seasons, and the human race, which the efforts of Ahriman worked hard to destroy. But the power of good alone, the great Ormuzd, was eternal, and must therefore ultimately prevail. Light was the type of the good spirit, darkness of the evil spirit; and, as stated above, God said to Zoroaster at his death that nothing was hidden but what shines." Hence the disciple of that prophet, when he performs his devotions in a temple, turns towards the sacred fire that burns upon its altar; and when in the open air, towards the sun, as the noblest of all lights, and that by which God sho's his divine influence over the whole and perfect of the works of his creation. [ARMAZEL.]

Zoroaster, we are told, was a great astrologer and magician; and it is even stated by Porphyrius that Darius was so proud of having been initiated into the mysteries of the art by Zoroaster himself, that he ordered it to be inscribed on his tomb.

Soon after his death the religion he introduced was disturbed by a thousand schisms; many reforms were introduced; but it gradually sank to a mere idolatrous worship of the fire and the sun; the worshippers were persecuted when Mohammedan rulers had possessed themselves of the throne of Iran; they first fled into the mountains, and at last left the country and settled in Guzerat, where they are to this day but greatly diminished in number.

(Hyde, *Veterum Persarum et Magorum Religionis Historia*, Oxford, 1760; Anquetil du Perron, *Zend-Avesta*, Paris, 1771; Pastoret, *Zoroastre, Confucius, et Mahomet comparés*: Malcolm's *History of Persia*; Bayle, *Diction. Historique*, has a long and curious article on Zoroaster.)

*ZORRILLA, Y MORAL DON JOSÉ, the most popular living poet of Spain, is a native of Valladolid, where he was born on the 21st of February 1817. His father, who held important posts in the magistracy, was transferred from Valladolid to Burgos, to Seville, and in 1827 to Madrid, where his son, who of course accompanied him in his migrations, was sent to the Seminary of Nobles in that city. In early life he showed a strong partiality for the theatre and poetry, and he was fond of reading two very different books, Chateaubriand's 'Spirit of Christianity' and the Bible. His father, who intended him for the legal profession, sent him to study law at Toledo; but Zorrilla spent much of his time in rambling about the city and writing verses. In the sequel, when going to Valladolid to pursue the same study, he entirely neglected it for poetry, making his first appearance as an author in the pages of 'El Artista,' a periodical of that city, he was sent to his father at Lerma, under the charge of a muleteer who was bound for that town, and was so apprehensive of the reception he was likely to meet with, that on their stopping at the house of one of his relations on the road, he gave the muleteer the slip, borrowed a horse of his relative without the owner's leave, and rode back to Valladolid, and thence to Madrid. For ten months he eluded all the efforts to trace him made by his family, and then suddenly burst into the public notice at the funeral of the poet Larra [LARRA]. Roca de Togores had just concluded a funeral oration on the deceased, "when," says Nicomedes Pastor Diaz, who was one of the mourners, "from the midst of us and as if he had sprung from the sepulchre, we saw appear a youth, almost a boy, who was unknown to us all. His countenance was pallid; he cast a sublime glance first at the tomb, and then at the sky, and raising a voice that sounded in our ears for

Digitized by Google

the first time, he began to read in broken and tremulous accents some verses in honour of Larra, which Señor Roca de Togores had to take from his hand, for overcome by the force of his emotions, he could not proceed. Our astonishment and our enthusiasm were equal. As soon as we learned the name of the gifted mortal who had pronounced such new and celestial harmony in our ears, we returned thanks to Providence for having raised up one poet at the death of another, and the same funeral procession which had just accompanied the illustrious Larra to the mansion of the dead left the precincts of the cemetery carrying in triumph a new poet to the world of the living, and proclaiming with enthusiasm the name of Zorrilla."

Such is the narrative prefixed by Pastor Diaz to a volume edited by himself and Roca de Togores of the poems of Zorrilla, which appeared a few months after in 1837. The contents in the volume seem to have been, in memory of Larra, the remainder are chiefly pieces in which may be traced the influence of the poetry of Byron and still more of the French romantic school of the period. With much that was crude there was much of promise—the poet was still so young that the most brilliant hopes were formed of his career, and they have not been disappointed. In his next volume of poems, which followed soon after, he had changed his line of thought, and announced his ambition to become a national poet, and, as a Spaniard and a Christian, to sing the glories of Christianity and Spain. To this determination he has adhered for the twenty years that have since elapsed, and has thus perhaps assisted in confining his fame to his native country, where he appears to be recognised as decidedly the first poet of his time. His productions are numerous. His dramas alone amount to more than twenty in number, all of them on national subjects, and written in the old national metre of Lope and Calderon. One of them, 'The Apotheosis of Calderon' is quite in the old Spanish taste, the characters being Fame, Repose, Criticism, Homer, Virgil, Shakspere, and Cervantes. In 'Don Juan Tenorio,' a play in two parts, founded on the story of the world-renowned libertine, the translation leaves the hero not in hell but in purgatory, amid a burst of religious doctrine and feeling which in England would be thought unusual for the stage. The most popular of his dramas is another in two parts, 'El Zapatero y el Rey' (the Shoemaker and the King), which has been one of the most successful on the Spanish boards. Many of the others are accused of being melodramatic, but none of being dull. His ballads and shorter pieces exhibit the same national air. One of the finest is undoubtedly 'A buen Juez, mejor Testigo' (The Judge good and the Witness better), a story of a seduced lady who, unable to obtain any evidence of her seducer's promise of marriage, appeals to a crucifix before which it was made, and is miraculously answered,—a tale so vividly and admirably told, that but for the Roman Catholic, and to English notions irreverent, character of some of its contents, it would probably have been long ere now naturalised and popular in English. While Zorrilla's subjects are thus national and antique, his style of narrative is by no means of the grave and serious real Spanish character, but rapid, concise, and energetic, with some of the best characteristics of modern French literature, which he appears to have studied closely. Perhaps his leading work, on the whole, is his 'Cantos del Trovador' (Songs of the Troubadour), a collection of legends and historical traditions (3 vols., Madrid, 1840-41). His 'Granada,' an epic poem (2 vols., Paris, 1852), appears to be less successful. In the preface he speaks in somewhat hyperbolic terms of Granada, which he informs us has "become for him the object of a superstitious idolatry which has absorbed all his thoughts." The whole history of the city was to be included in this poem and in another called the 'Cuento del Cuentos' (or Tale of Tales). Though no ardent a devotee of Spanish glory, Zorrilla has now lived for many years away from it, spending much of his time in France and Belgium, and by a passage in one of his notes to 'Granada,' he appears to have visited England. He speaks in the preface to the same poem of "the misfortunes which have nearly overwhelmed him," and "the loss of his parents and property." By a poem published as early as 1840 and addressed to his wife Donna Matilda O'Reilly y Zorrilla, it may be gathered that he was early married to a lady of Irish descent. An edition of his works was published at Paris in 1847, and again in 1853, as part of the collection of Spanish classics issued by Baudry.

ZOSIMUS, a native of Greece, succeeded Innocent I. as bishop of Rome, A.D. 417, under the reign of Honorius, emperor of the West. At that time Pelagius and his friend Celestius were disseminating in the west their peculiar doctrines about the merit of good works and the freedom of man from sin. Zosimus appears at first to have been captivated by the eloquence of Celestius, who was a ready and subtle speaker, and to have countenanced his tenets. But Pelagius and Celestius were soon after condemned by the council of Carthage, A.D. 418, and Zosimus confirmed the sentence of heresy against the Pelagians. A dispute about jurisdiction having arisen in Gaul between the bishop of Arles and the bishop of Vienne, Zosimus supported the bishop of Arles, but the other bishops of Gaul did not submit to his decision. Zosimus encouraged appeals from the bishops to the see of Rome. His letters on the Gaulish and Pelagian controversies are worthy of notice, and they are inserted in Constant's 'Epistolæ Romanorum Pontificum.' Zosimus died in December 418. (Muratori, *Annali d'Italia*, and the Church Historians.)

ZOSIMUS (*Ζώσιμος*), a Greek historian of the time of Theodosius the younger (A.D. 408-450). He is described by Photius ('Bibl. Cod.,' 98) as *κόμης καὶ ἀπὸ φισκοσυνήγορος*, (comes et advocatus fisci), and was perhaps a son of Zosimus, the prefect of Epirus, who is mentioned in the Theodosian Code in connection with some laws promulgated by Valentinian and Valens in A.D. 373. Zosimus is the author of an historical work still extant (*ἱστορία* or *ἱστορικὸν*), in six books, which appears to have been written after the year A.D. 425, as it (v. 27) mentions an occurrence which happened in that year. It begins with the history of Augustus, and after having given in the first book a sketch of the history of the emperors down to the end of Diocletian's reign, A.D. 305, the author devotes the remaining five books to a more detailed history of the Roman empire down to the year A.D. 409, when Rome was besieged by Alaric a second time, and Attalus was declared emperor by the Goths. Zosimus seems to have closely followed, as to this period, with the earlier writers on Roman history. Photius says that this work was a mere compilation from the chronicle of Eunapius, who however is not mentioned by Zosimus. He also used the works of Dexippus and Olympiodorus, from the latter of whom he copied whole chapters. As Zosimus did not examine the credibility of his sources, his own weight as an historical authority depends on that of his sources. The style of his history is well characterised by Photius, who calls it concise, pure, and pleasing. Zosimus himself was a pagan, and is severely censured by Christian writers for the frankness with which he records the crimes and vices of Christian emperors. (Phot., 'Bibl. Cod.,' 98; Evagrius, iii, 40, 41; Nicephorus, xvi. 41, &c.) But it cannot be proved that he carried his accusation any further than his duty as a historian required. The first edition of the history of Zosimus appeared in 1576, in a Latin translation by Lunclavius, fol. Basil. It contains the vindication of the character of Zosimus against the imputations of Christian writers, and also a Latin translation of Procopius, Agathias, and Jornandes. The first edition of the Greek text, with the translation of Leunclavius (though the translator's name is not mentioned) is that of H. Stephens, 4to, Geneva, 1581. In this edition Zosimus is printed with Herodian. Zosimus is also contained in Fr. Sylburg's 'Romanæ Historiæ Scriptores Græci,' fol., Frankfurt, 1590: this was followed by two separate editions of Zosimus, the one by Cellarius (Zeitz, 8vo, 1679, and Lipsiæ, 8vo, 1713), and the other by Thomas Smith (Oxford, 8vo, 1679). The best modern editions are that of J. F. Reitemeier (Leipzig, 8vo, 1784, with a valuable introduction, notes, and commentary), and of Emmanuel Bekker (Bonn, 8vo, 1837). There is an English translation, under the title of 'The New History of Count Zosimus,' 8vo, London, 1684. (Fabricius, *Biblioth. Græc.*, viii., p. 62, &c.; Vossius, *De Historicis*, p. 312, ed. Westermaan; Reitemeier, *Commentatio de Zosimi fide, stilo et Historicis quos ille sequutus est Scriptoribus*, in the *Bibliotheca Philologica*, ii., p. 1025, &c., Leipzig, 8vo, 1780.)

ZOUCH, RICHARD, an eminent English civilian, was born about 1590. He was educated on the free foundation of Winchester school; elected to New College, Oxford, in 1607, and chosen fellow in 1609. He took the degree of Bachelor of Civil Law in June 1614, and was admitted Doctors' Commons in January 1618. In April 1619 he commenced L.L.D., and was appointed Regius Professor of Law at Oxford in 1620. He represented Hythe in the last parliament of James I. In 1625 he was appointed principal of St. Alban's Hall, and chancellor of the diocese of Oxford, and soon after judge of the High Court of Admiralty. He contributed the legal arguments to the reasons against the Solemn League and Covenant, published by the University of Oxford in 1647. In 1648 he submitted to the parliamentary visitors, and was allowed to retain his university appointments till the Restoration. Cromwell appointed him one of the delegates in the cause of Don Pantaleon di Sa, brother of the Portuguese ambassador, who was tried and executed in 1653, for the murder of an English gentleman. At the Restoration he was reinstated as judge of the Admiralty, and nominated a commissioner for regulating the university. He died, we hear at his apartments in Doctors' Commons, on the 1st of March 1661.

Zouch published, in 1613, 'The Dove,' an indifferent poem. His professional works are:—1, 'Elementa Jurisprudentiæ, definitionibus, regulis, et sententiis selectioribus juris civilis illustrata,' 8vo, Oxford, 1629. 2, 'Descriptio juris et judicii feodalis, secundum consuetudines Mediolani et Normanniæ, pro introductione ad jurisprudentiam Anglicanam,' 8vo, Oxford, 1634. 3, 'Descriptio juris et judicii temporalis, secundum consuetudines feudales et Normannicas, 4to, Oxford, 1636. 4, 'Descriptio juris et judicii ecclesiastici, secundum canones et constitutiones Anglicanas,' 4to, Oxford, 1636. 5, 'Descriptio juris et judicii æcri; juris et judicii militaris; et juris et judicii maritimi,' 4to, Oxford, 1640. 6, 'Juris et judicii fecialis, sive juris inter gentes, &c. explicatio,' 4to, Oxford, 1650. 7, 'Cases and Questions resolved at Civil Law,' 8vo, Oxford, 1652. 8, 'Solutio quæstionis de legali delinquentis judice competente,' 8vo, 1657. 9, 'Eruditionis ingenuæ specimen, scilicet artium, logices dialectices, &c.,' 8vo, Oxford, 1657. 10, 'Quæstionum juris civilis centuria in decem classes distributa,' 8vo, Oxford, 1660. 11, 'The Jurisdiction of the Admiralty Court asserted against Sir Edward Coke's Articuli Admiralitatis, in the 22nd chapter of his Jurisdiction of Courts,' 8vo, London, 1663; a posthumous publication. An anonymous pamphlet, entitled 'Specimen quæstionum juris civilis,' 4to, Oxford 1653, has been attributed to Zouch.

ZOUCH, THOMAS, an English divine, was born near Wakefield in

Digitized by Google

Yorkshire, in 1737. He entered Trinity College, Cambridge, in 1757. In 1760 he was elected into one of Lord Craven's scholarships. He was chosen fellow of his college, and appointed assistant tutor in 1763. The state of his health obliging him to leave the University in 1770, his college presented him to the living of Wycliffe, in the North Riding of Yorkshire. In 1791 he was appointed deputy-commissary of the archdeaconry of Richmond; and in 1793 chaplain to the Master of the Rolls, and rector of Scrayingham. At the death of his elder brother, the Rev. Henry Zouch, he inherited an estate at Sandal, where he continued to reside till his death. Mr. Pitt conferred upon him the second prebend in the church of Durham. The see of Carlisle was offered to him in 1808, but he declined it on account of his advanced age. He died on the 17th of December, 1815. Dr. Zouch was an elegant classical scholar, and possessed considerable acquirements in botany. Besides several occasional discourses, he published 'An Inquiry into the Prophetic Character of the Romans, as described in Daniel viii. 23-25,' 1792; and 'An attempt to illustrate some of the Prophecies of the Old and New Testament,' 1800. He also published some biographical works :—1, 'Memoir of the Life and Writings of Sir Philip Sidney,' 4to, 1808; 2, 'Memoir of the Life of John Sudbury, D.D., Dean of Durham,' 4to, 1808; and an edition of Izaak Walton's 'Lives,' with additions.

ZOUST, GERARD, called sometimes Sowst and Scost, was a German portrait-painter of great ability, who established himself in England, and was one of Lely's rivals, in the reign of Charles II. He was born in Westphalia, in 1637, but the year in which he came to England is not known. Buckeridge, in his 'English school,' says he came to this country about the year 1656, and found encouragement suitable to his merit. "His portraits of men," he continues "are admirable, having in them a just, bold draft, and good colouring; but he did not always execute with a due regard to grace in women's faces; which is an habit that can only be acquired by drawing after the most perfect beauties, in which his country did not greatly abound. What we are most indebted to him for is his drawing Sir Peter Riley." Walpole says of Zoust—"By what I have seen of his hand, particularly his own head at Houghton, he was an admirable master. It is animated with truth and nature; round, bold, yet highly finished." Jervase, the painter, admired Zoust's style and endeavoured to imitate it: he copied a portrait which he had in his possession, by Zoust, more than once. Zoust was a man of singular temper, and was much displeased at Lely's female portraits being preferred to his. He was slovenly in his dress, and he often opened his house-door in Cursitor's-alley or Holborn-row himself, and if he did not like the look of his visitor, he used to say that his master was not at home. Walpole mentions several portraits by him, among them a fine head of Loggan, the engraver, one of Sir F. Throckmorton, and an excellent one of a gentleman in a dark purple gown, in the book of which was written the price of the picture and frame: the picture 3*l.* and the frame 16*s.* His draperies were frequently of satin, in which he imitated the manner of Terburgh. He died in 1681, aged forty-four.

ZSCHOKKE, JOHANN HEINRICH DANIEL, was born at Magdeburg in Prussia on March 22, 1771, and received the earlier part of his education in the Klosterschule and in the gymnasium of that town. When only seventeen he quitted his school and family, and became play-writer to a troop of strolling-players. In a short time however he returned to his family, and was sent to the university of Frankfurt-on-the-Oder, where, without any settled plan, he studied philosophy, theology, the fine arts, history, and finance. In 1792 he commenced private teaching in Frankfurt, but with little success; and he employed most of his time in writing for the stage, where his 'Abällino, the Bandit' (of which the story was borrowed by Monk Lewis for his 'Bravo of Venice'), and 'Julius von Sassen,' produced at this period, were favourably received. But he also wrote against a government edict respecting religion, and therefore when, in 1796, he applied for a professorship, it was refused him. He then left Frankfurt, travelled about Germany and France, and at length settled at Reichenau in the Graubundten where, in conjunction with Tscharner, he established a boarding-school for boys, which was so well conducted that the canton presented him with its freedom as a burgher, and he evinced his gratitude by writing his 'Geschichte der Freistaate der drei Bünde in Rhäeten' (History of the Free State of the Three Leagues in Rhetia), which was published in 1790. This is an account of the early associations of the canton for the establishment of its liberties, and was the precursor of several other works on the history of Switzerland. In that year however the Canton of Graubundten declined to join the Helvetic republic established under French influence; Zschokke was in favour of the union; he became unpopular, and his school was the sacrifice. Austrian troops entered the canton, and Zschokke withdrew to Aarau, where the central government of the Helvetic republic was then fixed. His reputation, his talents, and his political opinions, procured him employment under the government. He was made chief of the department of education, and was sent in the capacity of a fully-empowered government commissioner to settle the affairs of Unterwalden, then suffering from the devastations of a foreign enemy and the effects of party violence, where he acted as a true benefactor and a restorer of peace. A memorial of this remarkable period is given in his 'Historischen Denkwürdigkeiten der Schweitzerische Staatsumwälzung' (Historical Memoirs of the Swiss Revolution). His commission was subsequently extended over the cantons of Uri, Schwytz, and Zug, and his appeals for the help of the miserable sufferers remain in proof of his powers of eloquence. During this time he wrote his 'Geschichte vom Kämpfe und Untergange der Schweitzerische Berg- und Waldcantone' (History of the Conflicts and Fall of the Swiss Mountain and Forest Cantons), an excellent sketch, published in 1801. In 1801 the central government of Bern nominated him to the bailiwicks of Lugano and Bellinzona, where he executed his duties with the best results. On his return to Bern he was loud in his complaints against the French ambassador Bernhard, and the General Dunoux, on account of their oppressive conduct and arbitrary proceedings; for Zschokke had opposed the desires of the Graubundten for independence rather from a conviction of their hopelessness than from any unpatriotic love of French domination, and he stated "that the Helvetic executive directory enjoyed no influence or consideration; it was in a manner foreign to the people it was appointed to govern;" but it was not cruel, and it avoided anarchy, so that he was contented to act under it. His remonstrances had produced no immediate effects, when he was created governor of Basel, where a commotion had arisen against the land tax and tithes; he there threw himself into the midst of an armed assemblage of the people, and induced them to follow his advice and submit. When the central government at Bern, with the Landmann Aloys Reding at its head, prepared in 1801 to restore the ruptured federalism of the union, Zschokke resigned his offices, as he doubted whether the attempt could be successful then, and he retired to Biberstein in Aargau, to devote himself to his favourite studies. Much civil contention arose, and a civil war seemed inevitable, when in October 1802, Bonaparte offered his mediation, and by it the federal union of Switzerland was established in 1803. The modification brought Zschokke again into political activity. He was presented with the citizenship of Aargau, and nominated by the government in 1804 a member of the council of mines and forests. In the same year he commenced his popular 'Schweizerbote' (Swiss Messenger), and in 1807 his 'Miscellen für die neueste Weltkunde' (Miscellany of the most recent Events), which was continued without interruption till 1813; it displayed a happy choice of subjects, a richness of contents, a conscientious liberalism, and in general a strong and correct judgment. In 1814, when the Swiss, after the downfall of Bonaparte, again wished to reconstruct their constitution, Zschokke exerted himself to maintain peace in Aargau, while he strenuously defended its independence against the claims of Bern. In 1829, in consequence of some imputations against him as editor of the 'Schweizerbote,' he resigned his offices of church and forest inspector, but retained those of member of the council, of the school directory, and president of the directory of the school of education for artisans. In 1830 he was re-chosen a member of the educational council, and he immediately busied himself actively and effectively in the promotion of education and all social reforms, though his time was now chiefly given to literary composition. With these duties and his literary works, which became extremely numerous, he continued to occupy himself until his death, which took place at Biberstein, on June 27, 1848. His publications were of every character. We have noticed some of his historical and political productions, but in this class the most valuable are his 'Geschichte des Baierischen Volks und seiner Fürsten' (History of the Bavarian People and their Princes), 1813-18; and 'Des Schweizerlandes Geschichte für das Schweizervolk' (History of Switzerland for the Swiss People), 1822; which are highly esteemed, have been frequently reprinted, and are distinguished by a lucidity of arrangement, clearness of perception, a keen insight into character, and warmth and strength of expression. His novels and tales exceed all other classes in number. Among the best are his 'Adventures of a New Year's Night,' which was translated in 'Blackwood's Magazine,' 'Jonathan Frock,' a serio-comic novel, 'The Dead Guest,' and 'The Goldmaker's Village.' His merits are a correct delineation of the nicer shades of character, a naturally simple pathos, a happy exposition of some of the errors of our social institutions, a considerable amount of humour, and a constant maintenance of good principles and feelings. Some of these novels, like the 'Cottgers of Glenburnie,' aim at effecting the removal of social evils, as national prejudices, or injurious customs, such as 'Die Branntweinpest' (The Brandy Pest); he is frequently tedious, and his plots are improbable, and the least happy of his attempts are of the historical class. His poetry seldom rises beyond mediocrity, nor are his dramatic attempts of a high character. He had much knowledge of a kind acting him for his office of inspector of forests, and was acquainted with geology, particularly in reference to the country in which he resided, as is shown in his 'Gebirgsförster' and 'Die Alpenwälder.' By far the most popular of his works was his 'Stunden der Andacht' (Hours of Devotion), which was first published as a Sunday periodical, and which has gone through forty editions. It is one of the most complete expositions of modern rationalism, but its want of orthodoxy was held to be compensated by its fervid eloquence, and its zealous inculcation of every practical duty in all ranks. This work was not known to be his till the appearance of his 'Selbstschau,' a sort of autobiography of a somewhat singular character, which has been translated into English. He published a collected edition of his historical writings, in 1830, in 16 volumes, and a selection of his novels and poems in 10 volumes, in 1847; but an edition of his collected works, in 1825, occupied 40 vols.

Digitized by Google

Many of his works have been translated into French; and in English we have his 'Goldenthal,' a tale; 'Der Goldmacherdorf;' 'Love's Stratagem,' and other tales; 'The History of Switzerland;' a volume of select essays; and the 'Stunden der Andacht,' under the title of 'Hours of Meditation and Reflection.'

ZUCCARELLI, or ZUCCHERELLI, FRANCESCO, a distinguished Italian landscape-painter, born at Pitigliano, near Florence, in 1702. He first studied figure-painting, but he eventually decided upon following landscape-painting, in which his first instructor was Paolo Anesi, at Florence. He afterwards went to Rome and continued his studies with Moramdi, and lastly with Pietro Nelli. Zuccarelli established himself at Venice, but he acquired in time, through Smith's prints, after his works, so great a reputation in England, that he was induced to visit this country in 1752, and his success was such as to satisfy the most sanguine expectations. At the institution of the Royal Academy in 1768 he was elected one of the members, and is accordingly one of those who are considered its founders. Several of his pictures have been engraved by Vivares. The figures in them were painted by himself; and "it has been remarked," says Edwards, "that among the figures which he introduced in his landscapes, he frequently represented one with a *gourd-bottle* at his waist, as is often seen in Italy. This is said to have been done intentionally, as a sort of pun on his own name, *Zucco* being the Italian word for gourd."

In 1759 Zuccarelli painted a set of designs for tapestries, which were executed by the king's tapestry-weaver, Paul Saunders, for the Earl of Egremont's house in Piccadilly. He painted many creditable pictures in England, but they are generally very inferior to those he painted in Venice, and to which he was indebted for his reputation and the fortune he made in this country. His later works are cold in colouring, want harmony, and are artificial in their composition; there are some specimens at Hampton Court. Zuccarelli however in his time reigned over the public taste in England; and the chief cause of Wilson's want of success was because he did not imitate him.

In 1773 he returned to Florence, and he gave up painting, having resolved to pass the remainder of his life in quiet retirement; the suppression however by the Emperor of Austria of a monastery, on the security of which he had advanced money, deprived him of his property. This misfortune induced him to resume the pencil, and he found sufficient employment from the English gentlemen who visited Florence, where he continued to paint until his death in 1788. He etched some plates after Andrea del Sarto.

(Lanzi, *Storia Pittorica, &c.*; *Aneddotes of Painting, &c.*)

ZUCCARO, TADDEO and FEDERIGO, two celebrated Italian historical painters, were the sons of Ottaviano Zuccaro, an obscure painter, and were born at S. Angelo in Vado.

TADDEO ZUCCARO, was born in 1529. He studied first with Pompeo da Fano, and afterwards with Francesco da Forlì. He went early to Rome, and became a very popular painter, for the reason, says Lanzi, that there is nothing in his works that the populace cannot understand or imagine it understands. His pictures are compositions of portraits, simply disposed, dressed in the costume of his time, have little variety of character, and he rarely introduced the naked figure, but when he did it was natural and simple.

His early life—according to Vasari, who writes his name Zucchero—was one of extreme hardship. He left his father's house at the age of fourteen, and set out alone for Rome. Here he arrived there he found himself friendless and houseless, and he was forced to seek employment as a colour-grindor, but in this way he added little to his means, and he was for some time comparatively destitute. He passed many of his nights in the streets of Rome, sleeping among the ancient ruins, or under the porches of the modern palaces or churches; and after much perseverance, he was at last compelled by excessive privation to return to his father's house, there to recruit his shattered constitution, for, says Vasari, he had been living upon his youth; but during all this period he let pass no opportunity that occurred of improving himself in drawing. As soon as he had recovered his strength he returned with renewed courage to Rome, and this time his exertions met with a different reward. He attracted the notice of Daniello da Parma, who had painted some years with Correggio and Parmigiano, and who took Taddeo with him to Alvito near Sora, where he was about to paint a chapel in fresco. The experience he acquired in this work was of great value to him, and although only in his eighteenth year, he returned to Rome in 1543 a good fresco-painter, and he gave a proof of his ability by the frescoes in chiaroscuro which he executed on the façade of the house of Jacobo Mattei, illustrating the life of Furius Camillus. From this time he found steady employment, and executed many vast works, good, bad, and indifferent, at Rome and elsewhere. He painted several frescoes for the Duke of Urbino, for Pope Julius III., and for Pope Paul IV.; but his greatest works were those which he painted for Cardinal Alessandro Farnese at Caprarola; his best works at Rome are some frescoes in the church of the Consolazione.

The paintings of Caprarola illustrating the glories of the Farnese family were engraved in 45 plates by J. J. Prenner, and were published in Rome in 1748-50, in folio; and there is a description of the paintings and the palace by L. Sebastiani, 'Descrizione e Relazione istoriea del real Palazzo di Caprarola,' published also at Rome in 1741.

Taddeo died at Rome on the 2nd of September 1566, aged thirty-seven years and a day, and he was buried by the side of Raffaelle in the church of Santa Maria della Rotondo, or the Pantheon, at Rome.

FEDERIGO ZUCCARO, Taddeo's brother and pupil, was born at Sant' Angelo in Vado, in 1543. He was given to the charge of his brother at Rome when very young. Taddeo's numerous occupations gave Federigo great advantages, and he was early employed by his brother as an assistant. Federigo completed the works which Taddeo had left incomplete. He painted much in a similar style to that of Taddeo, but he was in every respect inferior to him, except in success and in the quantity and extentness of his works: his drawing was inferior, his compositions were more crowded, and there was generally more affectation in his style. He was invited by the Grand-Duke Francesco I. to Florence to paint the cupola of the cathedral, which had been commenced by Vasari. He there painted, says Lanzi, more than 300 figures 60 feet high, with a Lucifer so large, to use his own words, that the other figures appeared like babies. He boasted that they were the largest figures known, but, continues Lanzi, beyond their vastness they had nothing to recommend them. When Pietro da Cortona was in Florence there was a project to replace them by some works of that painter, but on account of the greatness of the undertaking, it was feared that he might not live long enough to complete it, and Federigo's works were not disturbed.

After this great work Federigo enjoyed a reputation which surpassed the fame of all his contemporaries, and he was recalled to Rome by Gregory XIII. to paint the ceiling of the Cappella Paolina in the Vatican. During the progress of this work he had a quarrel with some of the papal courtiers who brought various accusations against him, and to avenge himself he imitated the example of Apelles of Ephesus (Lucian, 'De Calumnia'), and painted a picture in ridicule in which he introduced the portraits of his accusers with asses' ears, and placed the picture on St. Luke's day over the door of the church of that saint. This proceeding was represented and gave offence to the pope, and Federigo was compelled to leave Rome immediately, to avoid the consequences. The picture in question is not the one he painted after Lucian's description of that of Apelles of Ephesus; this was painted in distemper on canvas, for the Orsini family; and it is, or was lately, in the Palazzo Lante; there is an engraving of it by Cornelius Cort. This is one of Federigo's best works.

After this event he went to Flanders, where he made some cartoons for tapestries; then to Holland, and thence came to England in 1574. Here he painted the portrait of Queen Elizabeth, and that of Mary Queen of Scots, which is at Chiswick, and which Vertue engraved. He painted a second portrait of Elizabeth in a sort of Persian dress, which is at Hampton Court, on which there is a scroll with the following verses attributed to Spenser, but which Walpole conjectures are by Elizabeth herself:—

> "The restless swallow fits my restless mind,
> In still revivings, still renewing wrongs;
> Her just complaints of cruelty I find
> Are all the musique that my life prolongs.
> With pensive thoughts my weeping stag I crown,
> Whose melancholy tearers my cares expresses;
> His tears in silence and my sighes unknown
> Are all the physicke that my harmes redresse.
> My only hope was in this goodly tree,
> Which I did plant in love, bring up in care,
> But all in vaine, for now to late I see
> The shales [shells] be mine, the kernels others are.
> My musique may be pleasing, but my teares,
> If this be all the fruit my love-tree beares."

Federigo painted likewise the portrait of Sir Nicholas Bacon at Woburn, and those of Charles Howard, earl of Nottingham, lord high admiral; and Elizabeth's giant porter, now at Hampton Court. Walpole had a portrait of Sir Francis Walsingham by him.

He did not remain long in England; he was soon forgiven and recalled by the pope, and he returned to Rome and finished the ceiling of the Paolina. At the end of 1585, after the accession of Sixtus V. to the papal chair, Zuccaro was invited by Philip II. to Spain to paint the Escurial, with a salary of 2000 scudi per annum. He arrived at Madrid in January 1586, and he was occupied in the Escurial nearly three years, during which time he painted several works in oil and in fresco, some of which however were immediately afterwards removed or destroyed; yet Zuccaro left Spain richly rewarded. He returned to Rome at the end of 1588. In 1595 he founded the Academy of St. Luke there, for which a charter had been granted by Gregory XIII., and it was confirmed by Sixtus V.: he was the first president. He wrote a book on the principles of painting, sculpture, and architecture, entitled 'L'idea di Pittori, Scultori, e Architetti,' and printed it in 1603 at Turin, with a dedication to the Duke of Savoy. He published two other works at Bologna in 1608—one giving an account of his visit to Parma, 'La dimora, di Parma, del Sig. Cav. Federigo Zuccaro;' the other giving an account of a journey in Italy and his stay at Parma, 'Il passaggio per Italia colla dimora di Parma, del Sig. Cav. Federigo Zuccaro.' He died in 1609, the year following, at Ancona. Federigo Zuccaro, though a mannerist, had great ability as a painter. He was also sculptor, poet, and architect, and he is said to have owed his success chiefly to his general

Digitized by Google

accomplishments and personal attractions: he was the most fortunate painter, or perhaps artist, of his time. Lanzi criticises his writings; he terms them bombastic and pedantic, and says that instead of instruction they present a mere tissue of sterile and undigested speculations, and that one page of Vasari is worth more than all that Zuccaro wrote.

ZUCCHI, ANTONIO, an Italian painter, born at Venice in 1726. His father, Francesco Zucchi, was an engraver, and was his son's first instructor in drawing; he afterwards learned painting under F. Fontebasso and J. Amigoni. Robert Adam, the architect, when in Italy, engaged Zucchi to make drawings for him; and Zucchi travelled with him in Italy and accompanied him to this country, and was much employed by him as an interior decorator and fresco painter. He painted mythological subjects, ruins, and ornaments: his colouring was pleasing, but his style was superficial and merely ornamental. He executed some works in the old Buckingham House, St. James's Park, and he painted much at Osterley Park, the seat of the Countess of Jersey, originally built by Sir Thomas Gresham. Zucchi lived several years in England, and was an Associate of the Royal Academy. He left this country in company with Angelica Kauffmann, and went to Rome, where he died in 1795.

(Longhi, *Vite de' Pittori Veneziani, &c.*; Edwards, *Anecdotes of Painting, &c.*)

ZUMALACARREGUI, TOMAS, was born, December 29, 1788, in the village of Ormaistegui, near Villareal, in the Spanish province of Guipuzcoa. His parents belonged to the class of nobles, but were not rich. When the French invaded the Spanish peninsula in 1808 he was studying law in the University of Pamplona. He then relinquished his legal studies, and entered the army as a cadet. He served under Mina, and in 1813 had risen to the rank of captain. In 1822 he was still a captain, and soon afterwards commanded two battalions of Quesada's division in the royalist army in opposition to that of the constitutionalists. In 1825 he became lieutenant-colonel, and had the command of the first regiment of King's Volunteers, and subsequently the Prince's Regiment, the third of the line. Soon afterwards he became colonel, and commanded the third regiment of light infantry, and afterwards the regiment of Estremadura, the 14th of the line. These successive removals were made on account of his talents and zeal in the discipline and organisation of large bodies of men; but his attachment to the party of Don Carlos was also known, and when the death of Ferdinand VII. was expected to take place, Zumalacarregui was not only displaced by the Minister of the Infantry, but was arrested as an enemy of the existing government. Having been set at liberty, he sent in his resignation, and retired to Pamplona, where his wife and family were residing. On the death of Ferdinand in September, 1833, he was offered the rank of brigadier-general on condition that he would attach himself to the queen's army, but this offer he declined. He was strictly watched, but escaped by night, and on the 30th of October joined the insurgents in the Basque Provinces. He collected a considerable force, though his means were limited to about 200*l.* of his own money, and in a series of mountain conflicts he overcame the best of the queen's generals. Don Carlos then joined secretly, and joined the army in July, 1834. Zumalacarregui defeated General Rodil in the valley of Amescoas on the 1st of August, routed the Christina force at Viana on the 7th of September, gained a victory in the plains of Vitoria on the 27th of October, and in the spring of 1835, after a conflict of four days with the queen's forces under Valdez, gained another important victory in the valley of Amescoas. On the 15th of June, while preparing to storm Bilbao, and while he was reconnoitring the place with a telescope, he was struck on the inner part of the calf of the leg by a musket-ball, which fractured the smaller bone, and lodged in the flesh. The ball was not extracted so soon as it ought to have been, inflammation supervened, and Zumalacarregui died, June 25, 1835. He had the sobriquet of "El Tio Tomas" (Uncle Thomas), by which he was more commonly designated than by his own name. In 1836 was published 'The most Striking Events of a Twelvemonth's Campaign with Zumalacarregui in Navarre and the Basque Provinces, by C. F. Henningsen, Captain of Lancers in the Service of Don Carlos,' 2 vols. 12mo.

ZUMMO, GAETANO GIULIO, a celebrated modeller in coloured wax, was born of a noble family at Syracuse in 1656: his name is commonly, but incorrectly, written Zumbo. He devoted himself early to the study of sculpture, and combining with it a careful investigation of the anatomy of the human body, he produced some very clever works and anatomical preparations coloured wax, preparations on a method of his own. He acquired a reputation in several cities of Italy—in Bologna, Genoa, but especially at Florence, where the Grand-Duke Cosmo III. took him into his service. Among other works which Zummo executed for this prince is one which is called 'La Carrusione' (Corruption): it consists of a group of five figures in high relief, showing various stages of decomposition of the human body after death. At one corner of this work he has put his own portrait, and inscribed under it his name as follows:—"Caet^us Julius Zummo Se^s," which is, "Cortesius Julius Zummo Syracusanus." He made another group showing the effects of the plague; and both works are as extremely repulsive to look at as they are remarkable for their ingenuity of execution. He made likewise at Florence several anatomical preparations. At Genoa he executed two very beautiful works, representing the Nativity and the Descent from the Cross; the latter has been well engraved by E. S. Cheran. They are both described by De Piles in his 'Cours de Peinture,'—'Description de deux ouvrages de Sculpture, qui appartiennent à Mr. Le Hag, faite par Mr. Zumbo, Gentilhomme Sicilien.' From Genoa Zummo went to Paris, where he died in 1701.

Upwards of a century before Zummo, Jacopo Vivio, an Italian artist, distinguished himself for his models in coloured wax; he is said to have made a copy of the Last Judgment by Michel Angelo in wax.

* ZUMPT, CARL GOTTLOB, was born on the 20th of March 1792, in Berlin. After receiving a good preparatory education in two of the gymnasiums of his native city, he proceeded in 1809 to the University of Heidelberg, where he devoted himself mostly to philological studies under Creuzer. In the following year he returned to Berlin, where, in the newly-founded university, he was stimulated and assisted in his favourite study of the classical languages by the lectures of Wolf, Heindorf, and Bekh. In 1812 he was appointed to the situation of an ordinary teacher in the Werder'schen Gymnasium, and continued in the performance of his duties there till 1821, when he was appointed a professor in the Joachimsthal Gymnasium. Meantime he had published his 'Rules of Latin Syntax' (Berlin, 1814), out of which, by additions, he constructed the first edition of his Latin Grammar, 'Lateinische Grammatik,' Berlin, 1818. In consequence of a dispute with the directors of the gymnasium, Zumpt resigned his professorship in 1826, and was for a time professor of history in the Military School, but in 1828 he was advanced to the situation of Professor of Roman Literature in the University of Berlin. In 1831 he made a tour in Italy, and in 1835 another in Greece. In the latter year he was elected a member of the Royal Academy of Sciences of Berlin.

Zumpt's great work is the 'Latin Grammar,' which has had a very large circulation in Germany, and has passed through several editions, each of which has been assiduously corrected and improved by the author, till it is become in its details quite a different work from what it was in its early state. Its chief merit consists in its copious and well-arranged syntax, and in this department it surpasses any Latin Grammar which has been produced in England. The etymology of the Latin language has been studied in this country more extensively than on the Continent, and in this branch its superiority is less decided. Two translations of Zumpt's 'Lateinische Grammatik' have been made into English. The first, by the Rev. John Kenrick, M.A., is from the third edition: the second, by Dr. Schmitz, is understood to be reprinted without receiving the corrections and improvements which had in the meantime been made in the German original. The other translation is by Dr. Schmitz, rector of the High School of Edinburgh. It is from the ninth edition of 1844, and was published in two in 1846, in communication with the author, and with all the latest improvements.

After Zumpt's Latin Grammar had been awhile in circulation, it was found necessary to provide a more rudimentary grammar for younger students, and this 'Aufzug' he has also translated by Dr. Schmitz, under the title of 'A School Grammar of the Latin Language, translated and adapted to the High School of Edinburgh,' 12mo, 1846.

Professor Zumpt's other works are mostly treatises and essays on subjects connected with the antiquities and usages of the Romans, such as, 'On the Court of the Centumviri' (Über Ursprung, Form, und Bedeutung des Centumviralgerichts), 4to, 1838; 'On the Personal Freedom of the Roman Citizen' (Über die Persönliche Freiheit des Römischen Bürgers), 8vo, 1846, and others. Some of these are lectures which have been delivered before the Royal Academy of Sciences, such as 'Die Religion des Römer,' 12mo, 1845. He has also published editions of some of the Roman authors, with valuable notes. Among these are Quinctilian's 'Institutiones Oratoriæ,' Cicero's 'Orationes in Verrem,' Quintus Curtius, and others.

ZURBARAN, FRANCISCO, a very celebrated Spanish painter, was born at Fuente de Cantos, in Estremadura, in November 1598; he is called the Spanish Caravaggio. His parents, who were of the labouring class, soon discovered in young Francisco an ability to excel in painting, and they accordingly sent him to Seville to the school of Juan de Roelas. He made very rapid progress, and from the great resemblance of even his earliest works to those of Caravaggio, he is supposed to have copied some pictures of that master which he may have seen at Seville. He drew correctly, always painted from nature, and was remarkable for his perservering studies of white draperies from the lay figure. In painting which he greatly excelled. In 1625 the Marquis de Malaçou commissioned Zurbaran to paint some pictures for the altar of St. Peter in the Cathedral of Seville; and about the same time he painted his celebrated picture of St. Thomas Aquinas, for the great altar of the church of the college of that saint at Seville; it contains many figures larger than life, and for nature, characcero, and general execution, is considered Zurbaran's master-piece, and rauke him, says Cean Bermudez, with the first masters of Christendom. Other celebrated works by Zurbaran at Seville are three, at the Carthusians of Santa Maria de las Cuevas; the two altar-pieces

Digitized by Google

of San Lorenzo and Sant' Antonio Abad at the Mercenarios Descalcos; some pictures at the Merced Calzada; those by him in the church of San Buenaventura; and the crucifix in the oratory of the convent of St. Paul. He painted likewise several works at Madrid in the Palacio Nuevo, and in the Buenretiro, and some of them probably before 1633, for on some works painted for the Carthusians at Xerez in that year he signs himself painter to the king (Philip III.), a title which he most probably acquired after he had executed some of his paintings at Madrid. He also spent some time at Madrid after this date working for Philip IV., but he returned to Seville, and died there in 1662. He formed no scholars at Madrid, but Fernabé de Ayala, the brothers Polanco, and others, were his scholars and imitators at Seville.

Zurbaran's works are very numerous at Seville: there are also several at Cordova and Guadalupe, and some at Castello and Penaranda. Out of Spain they are very uncommon, but Marshal Soult brought away some, and others have been sold and removed more recently. In the Spanish Museum in the Louvre there is a room devoted chiefly to the works of Zurbaran; there are in it, according to the catalogue, 81 pictures by him, but many of them are very indifferent, and are probably not by him. In this country the Duke of Sutherland has a good specimen of his style, and there is a 'Virgin in Glory' from his pencil in the possession of Lord Elcho; Mr. Stirling, the learned historian of Spanish painting, has also two pictures by him. In the National Gallery is a 'Franciscan Monk,' which, though not a very important work, affords a good illustration of his style. His works have a certain kind of power as those of Caravaggio, and less vulgarity. The pictures from the life of San Pedro Nolasco at the Merced Calzada at Seville, though some of Zurbaran's earliest works, are among his best; they are remarkable for the skill with which he has managed the white draperies of the monastics.

ZURITA, GERONYMO, a distinguished Spanish historian, was born at Saragossa, on the 4th of December, 1512. He studied at Alcala, under Hernan Nuñez. In 1530 he was appointed chief of the municipalities of Balbastro and Huesca. At a later period he succeeded his father-in-law, Juan Garzias de Olivan, as fiscal of Madrid. In 1543 he was admitted into the municipality of Seville, and sent on a mission to Germany. On his return to his native country in 1549, he was appointed by the states of Aragon *coronista* (chronicler) of the kingdom, the first who filled the office, then newly instituted.

The duties of this appointment appear to have engaged his whole time from 1549 to 1567. An ordinance was issued in his favour by Philip II. to all the municipalities and abbeys of his dominions, enjoining them to open their archives and communicate their most secret papers to Zurita. Thus authorised, the Coronista travelled through Aragon, Italy, and Sicily, and collected a great number of important documents.

In 1567 Zurita was appointed private secretary to the king. In 1568 the grand inquisitor intrusted to his charge all the correspondence of the holy office. Towards the close of his life he resigned his appointments, and retired to the Hieronymite convent of Saragossa. The continuation of his Annals of Aragon was the occupation of his declining years. He died in his convent, on the 3rd of November, 1581. His books he bequeathed to the Chartreux of Saragossa, but most of them were taken possession of for the Escurial library.

The works of Zurita are:—1, 'Anales de la Corona de Aragon,' Saragossa, 1562-79; 2, 'Indices rerum ab Aragoniae Regibus gestarum ab initiis regni ad annum 1410, tribus libris expositi,' Saragossa, 1578; 3, 'Progressos de la historia en el Reyno de Aragon, que contiene en quatros libros varios successos desde el an 1512, hasta el an 1550,' Saragossa, 1580; 4, 'Enmiendas y Advertencias en las coronicas de los reles de Castilla que escrivio don Lopez de Ayala,' Saragossa, 1683. Bouterwerk speaks in high terms of the writings of Zurita. By a lucid exposition of the connection of events he has succeeded in developing the growth of the Aragonese constitution.

It was Zurita who first discovered the 'Chronicon Alexandrinum,' published by Ducange among the Byzantine historians. Some grammatical notes of Zurita on the 'Commentaries of Cæsar,' Claudian, and the 'Antonine Itinerary' are preserved in manuscript in the libraries of the Chartreux of Saragossa and of the Escurial.

(*Elogios de Geronimo Zurita primer Coronista del Regno de Aragon*, par Diego Josef Dormer; N. Antonio, *Bibliotheca Hispana Nova.*)

ZWINGLI, or ULRICH ZUINGLIUS, the reformer of Switzerland, was born at Wildhaus in the Toggenburg, in January 1484. His father was a substantial farmer. Zwingli studied at Basel, and then at Bern, from whence he went to study philosophy at Vienna; on his return to Basel he went through his theological studies under Thomas Wyttenbach. He was ordained priest and said his first mass in 1506. He was then appointed to the parish of Glarus, the head town of the canton of that name. He applied himself strenuously to the study of the Scriptures in the Hebrew and Greek text, and that of the early fathers of the church. He appears to have been early impressed with a notion that all was not right in the government and discipline of the church as then established, and he communicated his doubts by letters to several learned men, with whom he was acquainted. His life was pure and exemplary, and he was much beloved by his flock for his sermons; he inculcated the practice of Gospel morality, avoiding as much as possible to speak of the intercession of saints, of images and relics, and of fasts and pilgrimages. Twice he accompanied, as chaplain, the military contingent of Glarus to the wars in Italy, in which the Swiss were then taking an active part, as auxiliaries to one or the other of the belligerents. Zwingli was at Milan when a part of the Swiss, won over by the intrigues and bribes of Cardinal Schinner, refused to ratify the treaty of peace with France agreed upon by most of the cantons, and marched out to attack the French army under Trivulzio, more than double their strength. They fought desperately for two days at Marignano, on the 14th and 15th of September 1515, lost one-half of their number, but at the same time so crippled the French that they were allowed to retire unmolested with their artillery and their wounded.

On his return to Switzerland, Zwingli wrote some strong remonstrances to the governments of the various cantons, intreating them to put a stop to the practice of foreign enlistment, and not to allow the blood of their countrymen to be wasted for quarrels not their own. After having filled his post at Glarus for ten years, he was appointed, in 1516, preacher to the monastery of Einsiedlen. There, in the very sanctuary of devotional practices, pilgrimages, indulgences, and votive offerings, Zwingli preached more freely than he had done at Glarus against the abuse of those things, entreating his audience to seek forgiveness through the merits of the Saviour alone, and not through the intercession of the Virgin and other saints, and to consult the Scriptures as the only safe rule in matters of faith. He had several conferences with Cardinal Schinner, whom he had known in Italy, and he warmly represented to him as to the Bishop of Constance the urgent necessity of a reform in the discipline of the church, intreating them and their brother prelates to take the work into their own hands, for fear that the people whose eyes began to be opened to the astounding corruption around them, should lose all respect for the church, and the whole social and religious world be thrown into anarchy. At this time Zwingli had not even heard of Luther, whose theses against the sale of indulgences were affixed at the gates of the Castle church of Wittenberg, on the last day of October 1517, when Zwingli had been already preaching at Einsiedlen against similar practices for nearly two years. This shows that the movement of the Reformation did not originate with Luther alone, but commenced simultaneously in different countries, where minds similarly tempered, though unacquainted with one another, felt a common impulse from general circumstances and from what they saw of the condition of the church around them.

In 1518 the traffic in indulgences spread to Switzerland. Bernardin Samson, a Franciscan friar of the convent of Milan, was commissioned by his superiors to sell indulgences in Switzerland. Samson, a vulgar Ignorant man, in his eagerness for commissions went beyond the lax notions of the times, according to which most people believed that indulgences remitted the guilt as well as the penalty of past offences, a notion unwarranted by the councils or by the divines of the Roman Church. Samson told the Swiss mountaineers that by purchasing indulgences to a certain amount they might obtain a new privilege or immunity for future sins which they might happen to commit. Samson however was opposed by Zwingli, who made a stand at the church gate of the abbey of Einsiedlen, and refused the friar admittance, being supported in this by the abbot, and especially by Theobald, baron of Geroldseck, who was the vogt or secular administrator of the abbey. Zwingli then preached to the assembled pilgrims, not exactly against the doctrine of indulgences, but against the glaring abuse of them which was being made, exposing the mercenary object of the friar, and laying the blame on the heads of the church, but on their subordinate agents. Even Faber, vicar of the bishop of Constance, was ashamed of Samson, and forbade him, under some allegation of informality, to sell his indulgences within his diocese. Bullinger, the rector of Bremgarten, and a friend of Zwingli, refused Samson admittance to his church. The friar however reaped a good harvest at Lucern, Bern, and other places.

In the mean time Zwingli had been invited by the chapter of the Gros Munster, or collegiate church of Zürich, to be their preacher, which offer he accepted, on condition that he should not be expected to preach anything but the word of God as it is in the Scriptures. On Samson making his appearance at Zürich, he found there his old antagonist, and was of course refused admittance. Soon after Samson left Switzerland to return to Milan, carrying with him, according to the accounts of Stettler, in his Chronicle, about 800,000 crowns. This was in 1519.

Zwingli, from his opposition to the sale of indulgences, was led to investigate other questionable practices of the Roman Church, as Luther was doing in Germany. He corresponded on these matters with several men of learning in other parts of Switzerland; Henry Lavit, of Glarus, styled Glareanus; Kodilin, who Latinised his name into Capito, according to the fashion of the times; Hauschein, of Basel, called Œcolampadius; Henry Bullinger, of Bremgarten; Thomas Wyttenbach, of Bienne; and Birchthold Haller, of Bern; all of whom preached against indulgences, and against the multiplicity of external forms in worship. They all insisted upon the propriety of reading prayers in the vernacular language of each country, and they recommended that religious instruction should be made clear, intelligible, and accessible to all. By degrees they were led on to gainsay the right assumed by the see of Rome to decide upon all religious and

Digitized by Google

ecclesiastical questions. Erasmus of Rotterdam, who was living at Basel, and who had gone along with them in exposing and ridiculing various superstitious practices and other clerical abuses, stopped short when his friends directed their attacks against the papal authority. [ERASMUS.] The court of Rome, whose attention was engrossed by Luther's German schism, had hitherto taken little notice of the Swiss controversy, but now it began to threaten the innovators with excommunication. The bishop of Constance forbade the preaching of the new doctrines, and the Mendicant orders laid charges of impiety and sedition against Zwingli before the magistrates of Zürich. Zwingli published his defence under the title of 'Apologeticus Archeteles,' in 1522, copies of which were rapidly spread all over Switzerland. Things bore a threatening aspect against Zwingli: Luther had just been condemned at Worms as a heretic, and was obliged to conceal himself. But Zwingli lived in a republican country, where he had less to fear from pope or emperor.

In January 1523, the Great or Legislative Council of Zürich appointed a conference to be held at the town-hall, to which all the ecclesiastics of the canton were invited, for the purpose of hearing the exposition of the new doctrines, and the arguments of their advocates as well as of their opponents. Zwingli published a list of articles to be discussed in the colloquy. As these form the main subject of the separation of the Swiss reformers, or Evangelicals, as they began to style themselves, from the Church of Rome, we shall quote the principal among them:—"It is an error," said Zwingli, "to assert that the Gospel is nothing without the approbation of the church, and to value other instructions and traditions equally with those contained in the Gospel. The Gospel teaches us that the observances enjoined by men do not avail to salvation. The mass is not a sacrifice, but a commemoration of the sacrifice of Jesus Christ. The power assumed by the pope and the bishops has no foundation in Scripture. God has not forbidden marriage to any class of Christians: therefore it is wrong to interdict it to priests, whose forced celibacy has become the cause of great licentiousness of manners. Confession made to a priest ought to be considered as an examination of the conscience, and not as an act which can decree absolution. To give absolution for money is simony. Holy Writ says nothing of Purgatory: God alone knows the judgment which he reserves for the dead; and as He has not been pleased to reveal it to us, we ought to refrain from indiscreet conjectures on the subject. The jurisdiction exercised by the clergy belongs to the secular magistracy, to whom all Christians ought to submit themselves. No person ought to be molested for his opinions; it is for the magistrates to stop the progress of those which tend to disturb the public tranquillity."

On the day fixed for the conference, the Council of Two Hundred, presided over by the burgomaster, assembled in the town-hall, whither the ecclesiastics of the canton, Zwingli included, repaired, together with a great number of spectators. The Bishop of Constance had sent Faber, his vicar-general, accompanied by several theologians. The burgomaster opened the sitting by explaining the motive which had induced the government to convoke the assembly, for the sake of becoming enlightened by a public discussion on the questions which distracted the church and unsettled the consciences of the people. He then invited those who considered the doctrines of Zwingli and his friends as heretical, to state their arguments against them. Faber however declined entering upon particular points of controversy, but descanted on the necessity of union in the church, and of obedience to the decrees of the Councils, who were inspired by the Holy Spirit; on the evils of heresy, and on the audacity of turbulent man who excited contentions and schisms. "As to those who appeal to the Scriptures in the three languages," said he, "I reply that it is not sufficient to quote the sacred writings, but that it is also necessary to understand them. Now the gift of interpretation is not one which is given to all. I do not boast of possessing it: I am ignorant of Hebrew; I know little of Greek; and, though I am sufficiently versed in Latin, yet I do not pretend to be an able orator. I disclaim the presumption of assuming the office of a judge on questions concerning salvation; these can only be decided by a general council, to whose decisions I shall submit without a murmur; and it would become all present to show a like submission."

To this Zwingli replied, that if by the church Faber understood the popes and cardinals, the historical records of many of them showed that they could not have been enlightened by the Holy Spirit; that if he meant the councils, as embodying the authority of the church, he was forgetting how many of those assemblies had accused each other of bad faith and heresy. "Even the fathers of the church," observed Zwingli, "cannot be regarded as unerring guides, since they often do not agree among themselves; witness St. Jerome and St. Augustin, who held very different opinions on important points. . . . There certainly is a church that cannot err, and directed by the Holy Spirit. This church is composed of all the true believers united in the bonds of faith and charity; but it is visible only to the eye of its divine founder, who knoweth his own. It does not assemble with pomp; it does not issue its decrees after the manner of the kings of the earth; it has no temporal reign; it seeks neither honours nor domination; to fulfil the will of God is the only care by which it is occupied." The conference after this turned upon the invocation of saints and other points in debate, but it was no more than a desultory conversation, as the two parties did not meet on common ground; Zwingli refusing to admit any arguments but those drawn from Scripture, while Faber chose his from the decisions of the councils and the traditions of the church. At last the burgomaster dissolved the meeting; but the council remained assembled, and after some deliberation, it came to a resolution that "Zwingli, having neither been convicted of heresy nor refuted, should continue to preach the Gospel as before; that the pastors of the town and territory of Zürich should ground their discourses on the words of Scripture alone, and that both parties should avoid all personal reflections and recriminations." The forms of worship remained unchanged for the present; mass continued to be said, the images remained, but more frequent and more scriptural sermons were preached for the instruction of the people. Some of the more impatient and rash partisans of the new doctrines, having pulled down a large crucifix which stood at one of the gates of Zürich, the culprits were arrested and charged with sacrilege. Zwingli blamed them for committing an act of violent innovation without the authority of the magistrate, but he at the same time maintained that the offence could not be called sacrilege, as images ought not to be objects of religious worship. This gave rise to much debate in the council, which at last convoked a second conference, for the purpose of deciding "whether the worship of images was authorised by the Gospel, and whether the mass ought to be retained." This conference was held in October 1523. About 900 persons were present, including most of the clergy of the canton of Zürich. The council had invited the other cantons and allies of the Confederation, as well as the University of Basel, to send their deputies, but Schaffhausen, St. Gall alone answered the call. Zwingli and his friend Leo Judä explained and supported their theses, namely, that the worship of images was unscriptural, and that the mass was not a sacrifice. The prior of the Augustines, after much desultory conversation, said that he could not refute Zwingli unless he were allowed to quote the canon law. The conference lasted three days, but was not productive of any new argument against the Reformers, who had full time to explain their doctrines and to produce a deep impression on the greater part of the assembly, after which the council closed the meeting, and adjourned its own decision to the following year.

During the interval the council applied to the bishops of Constance, Basel, and Coire, begging of them explicitly to state their sentiments concerning Zwingli's doctrines. The bishop of Constance alone sent to the council an apology for not doing so, which however contained nothing more than the usual reasonings of the Canonists in favour of whatever had been decreed by the church. Zwingli wrote an answer to it by order of the council, condemning the use of images, the invocation of the saints, the exhibition of relics in churches, and the value of such offerings. At the beginning of 1524, the Great Council ordered all the pictures, statues, relics, offerings, and other ornaments to be removed from the churches, allowing those which were the gift of private individuals to be restored to them or their descendants. Zwingli's Zürich was the first canton in Switzerland which openly embraced the Reformation: Bern, Basel, and Shaffhausen, and a part of Glarus and Appenzell, followed some years later. In January, 1525, the mass was finally abolished at Zürich; and on Easter Sunday of that year the Lord's Supper was celebrated according to the simple rites suggested by Zwingli, at which is the same as that observed in the Reformed churches of Switzerland and France to this day.

The next thing was to provide for the instruction of the people, and to find funds for that purpose. The chapter of the Great Münster, or Collegiate Church of Zürich, of which Zwingli was a member, was a very wealthy body: it had its own fiefs and jurisdictions, and was independent of the council. Zwingli reasoned with his brother canons on the propriety of allotting a part of their ample revenues for the purpose of education, and on the expediency of doing this of their own accord, without waiting for the power to interfere. A majority of the chapter having recognized either the justice or the prudence of concession, a convention was agreed upon between the chapter and the council, by which the former resigned its regalia of feudal jurisdiction and immunities of the state, swearing allegiance to the council as its sovereign, retaining at the same time the administration of its own revenues, of which a part was to be appropriated to defray the salary of spiritual pastors for the town. Those canons who were capable of performing pastoral functions should be employed as such, and those who were old and infirm should retain their benefices; but at their death their places were not to be filled up, and the revenues of their benefices were to be employed in founding professorships for the gratuitous instruction of the people. A small minority of five canons protested against the convention, alleging the authority of the pope; and, unwilling to submit themselves to the lay authority, they quitted Zürich and retired into the Roman Catholic cantons. The abbess of the Frauenmünster and her nuns followed the example of the chapter; and reserving pensions for themselves during life, they gave up to the state all their property and privileges. The surplus revenue was employed to found a seminary for candidates for the clerical profession. The convents of the mendicant orders were afterwards suppressed by order of the council, the aged and infirm members were granted annuities for life and a common habitation in one of the convents, and the others were placed in various trades and professions. The convent of the Dominicans was transformed into an

Digitized by Google

hospital for the sick; that of the Augustines into an asylum for the destitute. In every instance the property of the church was neither swallowed up by the treasury nor embezzled by grasping individuals. It was guaranteed by the state, and made into a distinct fund for the purposes of education, religious instruction, and charity. Vested rights were respected, and a decent regard was observed towards the feelings and prejudices of the old occupants. This mode of secularisation of church property, so very different from the system of spoliation and plunder pursued in other countries, then and in our own days, even by states calling themselves Roman Catholic, is one of the bright features of the Swiss reformation, for the other reformed cantons generally acted upon the same principle of honesty which Zwingli proclaimed and enforced at Zürich.

Zwingli was commissioned by the government to organise a system of public instruction adapted to the awakened intelligence of the age. He reformed the public schools, appointed new professors for the classical languages, and founded an academy for theological studies. He appointed Conrad Pellican, a native of Alsace, to one of the chairs of divinity, and Rudolf Collinus, of Lucern, to that of Greek: this was in 1526.

The Anabaptists, a fanatical sect, the wild offshot of the Reformation, who among other vagaries wished to establish a community of goods and a commonwealth independent of magistrates or government, made their appearance in the canton of Zürich. Zwingli had several conferences with some of their leaders: he tried to convince them of the impropriety and impracticability of their scheme, but all to no purpose: disturbances were excited, the Anabaptists, being warned by the Council, refused to submit; they stirred up the ignorant people to acts of violence, until the government was obliged to resort to measures of severity in order to restore tranquillity.

Zwingli did not attend the conference held at Baden in Aargau, in 1526, in presence of the deputies of all the cantons, in which Eckius, chancellor of the University of Ingolstadt, challenged the theologians of the Reformation. The council of Zurich would not allow Zwingli to go, as there was a manifest intention of seizing his person and condemning him as a heretic. Œcolampadius, who was less known and less obnoxious to the Romanists, undertook to answer the arguments of Eckius, but the majority of the cantons being Roman Catholic, the diet supported the resolutions of Eckius and Faber, grand-vicar of the Bishop of Constance, to the effect that Zwingli and his adherents should be considered as heretics, and as such excommunicated, and it condemned all changes in doctrine or worship, and forbade the sale of heretical books. The cantons of Bern, Zürich, Basel, Schaffhausen, Glarus, and Appenzell protested against this decision; but the Roman Catholic cantons began to act upon it, and arrested and put to death several of the Reformed preachers within their territories.

At the beginning of 1528 Zwingli repaired to a conference held at Bern, by order of the senate of that canton. He was attended by Œcolampadius, Bullinger, Collinus, and Pellican, and by Bucer and Capito, preachers at Strasbourg. The conference lasted nineteen days, and as it was laid down as a preliminary principle that no argument would be admitted which was not grounded on a text of Scripture, the Reformed divines obtained a full advantage over their opponents. The consequence was that the important canton of Bern publicly embraced the Reformation.

In September 1529, Zwingli repaired with Œcolampadius and others to Marburg to hold a conference with Luther and Melanchthon. They agreed upon the principal points of faith, and signed together fourteen articles, containing the essential doctrines of their common belief; they only differed upon the subject of the Eucharist. Luther maintained the doctrine of the real presence, while Zwingli, in his 'Commentary on True and False Religion,' had asserted that "the outward symbols of the blood and body of Christ undergo no supernatural change in the Eucharist." Zwingli and Luther, after much discussion, parted, still in controversy, but not in anger. Zwingli was averse from dogmatism, and he did not pretend to erect his own ideas into articles of faith. In his 'Exposition of the Christian Faith,' which he addressed shortly before his death to King Francis I., while he admits the necessity of justification by faith for all those to whom the Gospel has been made known, he discards the sentence of sweeping condemnation against those who have not been acquainted with the Scripture, and he expresses his belief that "all good men who have fulfilled the laws engraven on their consciences, whatever age or country they may have lived in, will partake of eternal felicity."

In the year 1531, after several angry and hostile remonstrations between the Roman Catholic and the Reformed cantons, war actually broke out. The Reformed cantons of Zürich in particular, complained of the persecutions to which their fellow-believers were subject, not only when found within the territory of the Roman Catholic cantons, but also on the neutral ground of Thurgau, Baden, and the other common subject bailiwicks, where the bailli or governor for the time happened to belong to a Roman Catholic state. The Roman Catholics complained of the interference of Zürich with the territories of the Abbot of St. Gall, where the commissioners from Zürich had proclaimed liberty of conscience. The grounds of the dispute were of a mixed nature, resulting from religious and political jealousy. The Roman Catholic cantons broadly refused liberty of conscience to their citizens or subjects, on the plea that it was contrary to the doctrine of their church. Bern and Zürich came to the determination of stopping the supplies of provisions which Lucern and the forest cantons were in the habit of procuring from or through the territories of the other two, forbidding the citizens of the Waldstatten to frequent the markets of Bern and Zürich, and enforcing a kind of blockade which was severely felt by the mountain cantons, which, being chiefly pastoral, depended for their supply of corn, salt, and other necessaries on the markets of their more favoured neighbours. The five cantons of Lucern, Zug, Schwyz, Uri, and Unterwalden declared war against Zürich and Bern, and their troops advanced to Cappel, a village on the road from Zug to Zürich, and within the territory of the latter canton. The council of Zürich, which was far from unanimous, was taken by surprise, for it did not expect so sudden an attack. A few hundred militia were posted at Cappel, and a body of about 2000 more were ordered to reinforce them in haste, and Zwingli received orders from the council to accompany and encourage them. On taking leave of his friends, he told them that their cause was good, but was ill-defended; that his life, as well as the lives of many excellent men who wished to restore religion to its primitive simplicity, would be sacrificed: but no matter, said he, "God will not abandon his servants; he will come to their assistance when you think all is lost."

On arriving at the field of battle the disproportion of the two hosts became visible. The men of the five cantons, nearly 8000 strong, attacked the Zürichers, by whom they were repulsed at first; but a body of the former passing through a wood, which had been left unguarded, turned the position of the Zürichers, and fell upon their rear. Confusion became general among the Zürichers, most of whom were killed and the rest dispersed. Zwingli received a mortal wound and fell, but not senseless. Some Catholic soldiers passing by, without knowing who he was, offered to fetch a confessor for the dying. They then exhorted him to recommend his soul to the Virgin Mary, to which Zwingli replied by a negative motion of the head. One of the soldiers then ran him through with his sword, saying that he ought to die, being an obstinate heretic. The next day, the body, being recognised, was burnt, and his ashes scattered to the wind, amidst the acclamations of the men of the five cantons. Zwingli was forty-seven years of age when he died. The battle of Cappel was fought on the 11th of October 1531.

Zwingli was a very remarkable man. Inferior perhaps to Luther in force of eloquence, and to Calvin in logical acuteness, he was possessed of deeper learning and more consistency and sobriety of thought than the German reformer, and had more candour and charity than he of Geneva. For piety of life, sincerity of purpose, and knowledge of the Scriptures, he is inferior to none of the reformers of the 16th century.

His works, written some in Latin and some in German, consist of controversial treatises, expositions of his doctrines, epistles, notes, and commentaries on the book of Genesis, on Isaiah, and Jeremiah, on the Gospels, and on the Epistles of Paul, James, and John; treatises on original sin, on Providence, on true and false religion, on the certainty and clearness of the word of God, and others. They were collected and published at Zürich in 3 vols. 4to, in 1581, with an 'Elenchus contra Catabaptistas,' consisting of sixty-seven articles or conclusions gathered from the works of Zwingli, with explanations. Myconius, J. G. Hess, Usteri, and Vögelin have written biographies of Zwingli; and Hottinger, in his history of the Swiss Reformation, has spoken of him at length. The Life of Zwingli, by Hess, has been translated into English, by Lucy Aikin; and the Life and Times of Zwingli by J. J. Hottinger, by Professor T. C. Porter.

The disciples of Zwingli received the name of ZWINGLIANS, and consequently that name was given to the reformed churches of German Switzerland in general. Owing to their controversy with the Lutherans concerning the real presence in the Eucharist, they were also called 'Sacramentarians.' But the name which they themselves assumed was that of Evangelicals, which after a time displaced the other two. They are also called by the name of the Reformed Churches of Switzerland, as distinct from that of Protestant, which applies more particularly to the German Reformed Churches, in consequence of the 'protest' delivered to the Diet of Spires, in April 1529. It ought to be observed however that the Lutherans were not alone in signing the protest, as many towns of Germany and the Landgrave of Hesse, whose tenets were like those of the Zwinglians or Sacramentarians, also joined in it; so that the appellation of Protestant is not confined to the Lutheran Church, but applies in an historical sense to the German reformed churches in general. The Swiss had no participation in the protest, which was a political act of the German states.

The Swiss cantons and towns which embraced the reformed doctrines as preached by Zwingli, did not constitute one compact and uniform church; having no bishops or hierarchy, and being politically divided into independent republics, or municipalities, each canton had its synod or assembly of pastors, which regulated all ecclesiastical affairs, in concert with the lay authority. Zwingli had from the beginning inculcated the principle of subjection to the magistrates in matters concerning temporal discipline and jurisdiction. Spiritual matters alone were left entirely to the pastors. We read of the church of Zürich, the church of Basel, the church of Bern, and others; they all called each other sisters—they all lived in communion with one another—they all agreed in the fundamental points of faith, but each

Digitized by Google

drew up its formulary or profession of faith. At last the want of a common bond among them, like the confession of Augsburg for the Lutherans, was felt. The impulse however came from Germany. In 1566 the Emperor Maximilian II. convoked a diet at Augsburg to settle the political disputes among the various states of Germany which arose from the difference of religion. The Lutherans endeavoured to keep out the Sacramentarians, as they styled them, from the general pacification of Germany; and above all, they strove to exclude Frederic III., elector-palatine, who was at the head of that party. Frederic asked the advice of Bullinger, the friend of Zwingli, whom he had succeeded as head pastor at Zürich, and requested him to forward him a confession of faith, which he might lay before the diet. Shortly before this Bullinger had privately written an abstract of his belief, as a legacy to his friends, during a pestilence which desolated Switzerland, and by which he had been attacked himself, but recovered, after losing his wife and children. He now sent it to the elector, who wrote an answer to testify his joy at the perusal of Bullinger's confession. All the reformed cantons and towns of Switzerland then said, "Why not adopt it as our own?" And it was so adopted.

"Every confession of faith," observes a modern Swiss historian, "partakes of the character of the age in which it is written, but that of Bullinger may be said to have been better than its age. It was neither the offspring of polemical disputation, nor the cold, calculating work of an assembly of theologians; it was the effusion of a pious mind, animated by a wish for peace. It was the work of a man who, when he wrote it, thought himself on the brink of the grave, and it partook of the solemnity of that last period of existence. There was no mention of anathema in it. On the subject of the Eucharist, it expressed Zwingli's doctrine clearly, but in a less harsh and abrupt manner than that of the preceding formularies. Beza, who had succeeded Calvin as the head of the church of Geneva, hastened to sign Bullinger's Confession. Zürich, Bern, Schaffhausen, Mulhausen, Bienne, and St. Gall gave in their assent. The Evangelical portion of Appenzell and Glarus were already agreed in their tenets with the church of Zürich. Neuchâtel added its signature to that of its allies. Basel had an old formulary of its own, which did not materially differ from Bullinger's confession, and it was only in the following century that it formally acknowledged the Helvetic confession of faith, as it was now styled. Knox and about forty ministers of the kirk of Scotland sent in their signatures. The churches of the Palatinate, those of Poland and Hungary, signed also the Helvetic Confession. The reformed churches of France, through political and other reasons, drew out a confession of their own, acknowledging however their concord with the Swiss churches." (Vuillemin, 'Histoire de la Confédération Suisse, Continuation de Müller, Glouta, et Hottinger.') An abstract of the Helvetic confession of faith is given in the appendix to the 'History of Switzerland' published by the Society for the Diffusion of Useful Knowledge. On the abstruse topic of predestination, it affirms that "God, out of his wisdom, has predestined or chosen, from all eternity, freely, of his own mere grace, and without regard for persons, the righteous whom he intends to save through Jesus Christ," but at the same time it condemns any rash judgment concerning the salvation of any one individual or class; and it says that we must hope favourably of every one. "If we hold communion with Christ, and that by means of a true faith, he be ours and we his, we then have a tolerably certain proof that our names are written in the book of life."

The appellation of Calvinists has occasioned some confusion with regard to the Reformed churches. Calvin, who began his career as a Reformer several years after Zwingli's death, and when the Reformation in Switzerland had been already effected, was, properly speaking, the head and the great teacher of the church of Geneva. His doctrines, which may hardly be said to differ in any point from those of the Helvetic Church, except perhaps in a stronger expression of the dogma of predestination, exercised an influence over the Reformed churches of France. But Calvin has had no influence over Switzerland, where the Reformation was established long before his time; and it is only by a sort of anachronism that the Reformed churches of Switzerland have been called Calvinistical.

SUPPLEMENTARY NAMES.

In the Alphabetical arrangement of the "English Cyclopædia," some names that it was intended therein to have had a place have been omitted. The *Supplementary Names* now given will not meet the wishes of several correspondents, who have pressed upon us the extension of our list, especially of living persons. Some of the names which now appear may even suggest the inquiry, why they should be inserted whilst others are omitted? The omission in their proper places of those which now appear has chiefly arisen from the want of the necessary materials in time for periodical publication, and from other circumstances. The omission of some others, both in the alphabetical order and in this Supplementary List, has in some cases arisen from individual reluctance to furnish the necessary materials for a Biography. But with reference to the general question of omissions, we have only to call attention to the fact that the extent of our work was confined within the limit of these six volumes. Many names of persons worthy to have a place in a *complete* catalogue of those who have obtained celebrity in Science, Literature, or Art, and of Public Men eminent in Civil or Military stations, both of the past time and the present, are no doubt wanting in this Cyclopædia; but had we attempted an almost impossible completeness, we should have required many more volumes than six, and have engaged in an undertaking far beyond that with which we proposed to meet the public demand. As the Cyclopædia of Biography now stands, it will be found to embrace a wider range than any existing English work of the same character; and it may be not disadvantageously compared, for practical usefulness, with the most voluminous of the German or French Biographical Dictionaries.

A BECKET, GILBERT ABBOTT.

A BECKET, GILBERT ABBOTT, was born in Golden-square, London, in the year 1810, the son of a respectable solicitor, and was educated at Westminster School. He very early displayed great talent as a humourist. As early as 1825 eight of his dramatic productions, in prose and verse, but all of a burlesque character, were published in Duncombe's 'British Theatre;' in 1828-29 nine more appeared in Cumberland's 'British Theatre;' and in 1837 four others were printed in Webster's 'Acting Drama;' most of which had attained some success on the stage. In 1843 he produced 'The Mirror, or Hall of Statues,' a musical burlesque. In connection with the drama, also, he published in 1844 'Scenes from the Rejected Comedies by some of the Competitors for the Prize offered by Mr. Webster:' these 'Scenes' were a series of parodies upon living dramatists (including one of himself), which had appeared in 'Punch' previous to their publication in a separate form. In 1846 he published 'The Quizziology of the British Drama.' In conjunction with his schoolfellow, Mr. Henry Mayhew, he started several comic periodical works, of which 'Figaro in London,' began about 1830, was undoubtedly the precursor of 'Punch.' When that work had swallowed up its rivals, Mr. A Becket became a constant contributor to it, and the adventures, the epistles, and anecdotes of Mr. Dunup were among the most laughable morceaux of that publication. He took a pride in the work, and it was his boast that, till the period of his death, no number appeared without something, however small, from his pen. His humour was without malice, and displayed a varied reading, with considerable knowledge of the law; in the midst of his ebullitions of fancy, he had not neglected the more serious studies of his profession. He was trained as a lawyer; and in March 1846 his reputation induced Mr. Charles Buller to entrust to him the investigation of the iniquities practised in the Andover Union. This he conducted in a most satisfactory manner, and in his report he displayed a clear and solid judgment in sober and well-chosen language. Some leaders in 'The Times' on the same subject have been also attributed to him: he had previously been an occasional contributor to that journal. His conduct of the Andover inquiry led to his appointment in 1849 as magistrate of the police-court of Greenwich and Woolwich, whence he was removed in 1850 to that of Southwark—positions which he held in an irreproachable manner. Besides an edition of 'The Small Debts Act, with Annotations and Explanations,' published in 1845, he produced the 'Comic Blackstone,' which was published in 1844-46; a 'Comic History of England,' published in monthly parts, forming a volume completed in 1848; and a 'Comic History of Rome,' also in monthly parts, completed in 1852. He likewise, in 1845, edited George Cruikshank's 'Table Book.' After a very short illness he died at Boulogne, on the 28th of April 1856.

AMHERST, WILLIAM PITT, 2ND LORD AND 1ST EARL, nephew and successor of the first Lord Amherst [AMHERST, JEFFERY, BARON], was born in 1773. He was sent as ambassador to China early in the present century, but was wrecked on his return in the Eastern seas, and with difficulty reached Java in an open boat. He succeeded the Marquis of Hastings as governor-general of India in 1823. He signalised his administration by the first Birmese war, which was brought to a successful issue by the arms of Lord Combermere, and resulted in the annexation of Assam, Aracan, Tenasserim, and other provinces of the Birman empire to the British dominions. He was created an earl in 1826, and resigned his post in India in 1827, when he was succeeded by Lord William Bentinck. He spent the latter years of his life in retirement, and died in March 1857, in his eighty-fifth year.

ANSTED, DAVID THOMAS.

*ANSTED, DAVID THOMAS, a distinguished living geologist, was born in London about the year 1814. He was educated at Cambridge, where he was one of the most zealous and distinguished scholars of the celebrated professor of geology in that university, Adam Sedgwick. On the retirement of Mr. John Phillips from the chair of geology in King's College, London, Mr. Ansted was appointed his successor. He subsequently became assistant secretary to the Geological Society, and editor of the 'Journal' and 'Proceedings' of that society. In 1844 he published his first work on geology, in 2 vols. 8vo, with the title 'Geology, Introductory, Descriptive, and Practical, with numerous Illustrations, comprising Diagrams, Fossils, and Geological Localities.' This work, which was written in a clear and elegant style, at once obtained for its author a high position as a geologist. The subject of geology was treated in it in a more systematic manner than in any previous treatise; the practical departments of the science were also more fully developed. In 1845 he published a smaller work, which was an epitome of the first work, and was called 'The Geologist's Text-Book.' At this time Mr. Ansted delivered courses of lectures in many of the literary and scientific institutions of the metropolis and the larger towns of England. In this way he was largely instrumental in diffusing a knowledge of those sound principles of geology which are recognised as extensively in this country, and have made it the most popular of the various branches of natural knowledge. In 1847 he published a popular manual on geology, entitled 'The Ancient World, or Picturesque Sketches of Great Britain.' At the time of the discovery of gold in Australia, Mr. Ansted produced a little volume, intended as a geological guide to those who were engaged in seeking for the precious metal, with the title of 'The Gold-Seeker's Manual.' He also produced a smaller work on the subject of geology, including mineralogy and physical geography, intended as a text-book for those attending geological lectures, with the title 'An Elementary Course of Geology, Mineralogy, and Physical Geography.' One of his most recent contributions to geological literature is on 'The Applications of Geology to the Arts and Manufactures.' All these works are written in a popular style, and have supplied a large proportion of the general reading on the subject of geology at the present day. Independent of these distinct works, Mr. Ansted has written several papers on geology, which have been published in the Journals and Transactions of societies devoted to geological science. Of these the following may be mentioned:—'On the Carboniferous and Transition Rocks of Bohemia' (Proc. Geol. Soc., vol. iii.); 'On the Zoological Condition of Chalk Flints, and the probable causes of the Deposit of Flinty Strata alternating with the upper beds of the Cretaceous Formation' (Annals and Mag. of Nat. Hist., vol. xiii.); 'On a Portion of the Tertiary Formations of Switzerland' (Trans. Cambridge Phil. Soc., vol. v.).

Digitized by Google

During the last few years Professor Ansted has devoted himself to the practical applications of geological science in the investigation of the strata of the earth containing mineral riches. In the course of these researches he has travelled extensively both in the New and Old Worlds, and has produced many elaborate and valuable reports.

*ARGELANDER, FRIEDRICH WILHELM AUGUST, Professor of Astronomy in the University of Bonn, and one of the most eminent astronomers of our time, was born at Memel, in East Prussia, on the 22nd of March 1799. He was educated in the University of Königsberg, where he at first studied financial economy (Kameralswissenschaften); but the discourses of Bessel led him to exchange that study for astronomy. Under Bessel's instruction he was soon occupied with practical calculations and observations, and in 1820 was appointed his assistant in the Königsberg Observatory. In 1822 he employed himself as a private tutor in the university, whence, in 1823, he removed to the handsome newly-erected observatory at Abo in Finland, where he succeeded the astronomer Waldeck. Here he diligently occupied himself in examining principally those stars which have a peculiar motion. A fire, which destroyed Abo in 1827, interrupted his labours. The university was removed to Helsingfors in 1832, whither he had to follow; and he had to superintend the building of a new observatory, which was completed in 1834. The result of his observations was a catalogue of 560 stars having a peculiar motion, which was published by the Academy of St. Petersburg, and received the Demidoff prize. In 1837 he was nominated to the post at Bonn which he at present holds. Here he was again called upon to superintend the construction of an observatory, which was not completed till 1845. In the interim, as the produce of his observations, he published at Berlin, in 1843, 'Uranometria nova,' an astronomical chart, with specifications of the different relative magnitudes of the stars visible by the naked eye. In 1846 he published at Bonn, 'Astronomische Beobachtungen auf der Sternwarte zu Bonn,' which is a continuation of Bessel's observations on the zone, and contains a review of the Northern Hemisphere from 45° to 80° of declination, fixing the position of about 22,000 stars. His labours during the last twenty years have been directed to the subject of the change of luminosity in some of the variable stars. In 1856 he published some additional observations on the Northern Hemisphere.

AUCKLAND, GEORGE EDEN, 2ND LORD AND 1ST EARL OF, eldest surviving son of the 1st lord, was born in 1784. After receiving his education at Eton and Oxford, he entered the House of Commons as M.P. for Woodstock, but was soon removed to the House of Lords by his father's death. He formed a part of the Whig administration as President of the Board of Trade, and was appointed First Lord of the Admiralty by Lord Melbourne in 1834. In the following year he went out to India as governor-general. His administration is marked by the ill-advised Afghan war (1838-39), almost the only blight upon which was the capture of Ghuznee by Sir John Keane in 1839 (KEANE, LORD). The Earl of Auckland was recalled to England in 1842, having been previously advanced to an earldom; the final settlement of the Afghan affairs was left for his successor, the Earl of Ellenborough. Lord Auckland died suddenly, January 1st, 1849.

AYTOUN, WILLIAM EDMONDSTOUNE, Professor of Rhetoric in the University of Edinburgh, was born in Fifeshire in 1813, and educated in Edinburgh University, where in 1831 he gained the prize for his poem of 'Judith.' For some time Mr. Aytoun practised as a writer to the signet at Edinburgh, but in 1840 was called to the bar. By his writings and his social qualities having obtained a high local reputation, Mr. Aytoun was in 1845 appointed to the chair of rhetoric in the University of Edinburgh, and his lectures have amply sustained his previous celebrity. His literary standing has also been supported by his position as editor of 'Blackwood's Magazine,' in which office he succeeded his father-in-law, John Wilson, and he has contributed to the magazine many sparkling essays and sharp criticisms, as well as much poetry. His services to the Conservative cause were acknowledged by his appointment by the Derby-Disraeli ministry, in 1852, as sheriff and vice-admiral of the Orkneys. His claim to public notice as a poet is founded mainly on his 'Lays of the Scottish Cavaliers,' 8vo, Edin., 1849 (10th edit., 1857), which are marked by a good deal of the old Scottish ballad spirit and energy, with an ample share of modern nationality; but he has also published 'Poland, and other Poems,' and 'Bothwell, a poem, in six parts,' 8vo, Edinb., 1856; and the caustic parody on certain poets of the so-called spasmodic school, 'Fermilian, or the Student of Badajos; a Spasmodic Tragedy, by T. Percy Jones' (Edinb. 1854), is understood to be a production of his fluent pen. In prose his only separate work is 'The Life and Times of Richard the First, King of England,' 8vo, Lond., 1840. In 1853 Professor Aytoun delivered a series of lectures on 'Poetry and Dramatic Literature' to a distinguished audience at Willis's Rooms, London. 'The Ballads of Scotland, edited by Professor Aytoun,' were published in 1858. [*See* SUPPLEMENT.]

*BAILEY, PHILIP JAMES, author of 'Festus,' was born in Nottingham, April 22, 1816, and was educated at Nottingham and at Glasgow University. Having selected the legal profession, he in 1833 entered the office of a solicitor in the Temple, where he remained for two years. Turning his thoughts to the bar, he then entered a conveyancer's office; was admitted a member of Lincoln's Inn in 1835; and in 1840 was called to the bar. In the previous year however he had published his poem 'Festus' (commenced in 1836), and the general attention which that remarkable work excited had probably deepened his long growing dislike to the law; at any rate, he after a short time abandoned the bar, returned to Nottingham, and devoted himself to literary, and especially to poetic studies. 'Festus' created a new phase of English poetic literature. A work written with a moral and metaphysical purpose (a kind of devouter Faust) treating often of the highest and most abstruse subjects—

> (" It aims to mark
> The various beliefs as well as doubts
> Which hold or search by turns the mind of youth,
> Unresting anywhere")—

lofty and swelling in diction, yet occasionally stooping to the homeliest colloquialisms; earnest, and even passionate in tone and manner, abounding in strange, often extravagant metaphors, and turns of expression, and in vivid descriptions, yet everywhere running into mysticism and obscurity,—however it might be open to captious or to sober criticism, was a work well calculated to captivate young and ardent minds; and it found many and passionate admirers and imitators, as well in America as in the author's native country. Its influence on younger poets, especially those of a metaphysical turn, has been very great. Though 'Festus' passed through several editions (a fifth was published in 1852), it was not till 1850 that Mr. Bailey put forth a new poem, when there appeared 'The Angel World, and other Poems,' in which the reader was carried into the realms of Christian doctrine. Again he was silent till 1855, when he published his 'Mystic,' another psychological poem, and even more voluminous in its soaring, and more mystical in treatment than was 'Festus,' but, like it, abounding in passages of power, beauty, and suggestiveness.

BAINES, EDWARD, an eminent example of the success of industry, good conduct, integrity, and of unceasing endeavours to make his talents beneficial to his fellow-men as well as useful to himself, was born on February 5, 1774, at Walton-le-Dale, a village about a mile from Preston, in Lancashire, of a respectable but not wealthy family long settled at Marton-le-Moor, near Ripon, in Yorkshire. He was first sent to the free grammar-school at Hawkshead, the master of which was Edward Christian, afterwards Downing Professor of Law in the University of Cambridge, whence he was removed when eight years old to the free grammar-school of Preston. His father had commenced business as a cotton-weaver, and wished to bring his son up to the same business, but he preferred a more intellectual employment, and at the age of sixteen was apprenticed to a printer in Preston. After serving about four years and a half, during which time he had seen something of the management of a country paper, his master's business failing off, he transferred his services to Leeds, where he finished his time in the office of the 'Leeds Mercury.' During his apprenticeship he sedulously cultivated his mind. He invited several of his companions to join him in forming reading and debating societies, in the latter of which he is said to have distinguished himself by his liberal opinions, his temperance, and his plain good sense. In September 1797, the day after the expiration of his apprenticeship, he began business for himself in connection with a partner, from whom he separated in the course of the following year. From the political circumstances of the time the dissenters from the Church of England were the most liberal in their political opinions. Mr. Baines, from their consonance with his own, was thus brought into association with many of the most influential among them; and at length joined the body as an Independent. In July 1798 he married the daughter of Mr. Matthew Talbot, an excellent and pious woman, and continued by his industry and attention to business to win the confidence of the dissenting body and to increase his means. In 1801, assisted by some of the wealthier members of that body, he purchased the copyright and the printing materials of the 'Leeds Mercury,' of which he immediately became editor as well as printer. By judicious but not sudden improvements he gradually increased its circulation, and extended its influence, while his good taste and temper led him to abjure all grossness and bitterness of altercation; and he promoted as far as by in his power all local schemes for the amelioration of the position of his poor fellow-townsmen, by advocating the establishment of hospitals, friendly societies (savings-banks had not yet been established), and the extension of education. A large part of the influence he acquired arose from his being among the first who introduced leaders or original editorial dissertations on political subjects into a provincial paper; these leaders being distinguished by the moderation of their tone, their independence, their fearless advocacy of the opinions he entertained, the force of their style, and their general good sense. In the severely contested election for Yorkshire in 1807, he took an energetic part in support of Lord Milton in opposition to Mr. Lascelles, although he differed in opinion from Lord Milton respecting the desirableness of peace on proper terms, and a reform in parliament, both of which he advocated, while there were few more earnest in supporting the dignity of England when threatened by France, and his appeals to the inhabitants of Leeds to join the volunteers when an invasion was feared, had a most remarkable effect. But we are not about to narrate all the incidents connected with Mr. Baines's conduct of his paper, which

Digitized by Google

was carried on with a strict adherence to the same principles until the close of his life; we shall only say that he was the principal means, in his paper, of developing, in 1817, the conspiracy of Oliver and Castles, the paid emissaries of the government to foment insurrections in the northern counties, and that after his exposure there were no more plots. In 1815 he made his first prominent appearance as a public speaker at a meeting at Leeds to oppose the enactment of the Corn Laws, and in 1817, at another in favour of parliamentary reform. In 1814 he commenced the publication of 'The History of the Wars of the French Revolution,' which met with such success that he continued it under the title of a 'History of the Reign of George III.,' the whole being a compilation of considerable impartiality and talent. In 1822 and 1823 he wrote and published 'The History, Directory, and Gazetteer of the County of York,' in two thick volumes; and in 1824-5 a similar work for the county of Lancaster, subsequently expanded into a 'History of the County Palatine and Duchy of Lancaster,' which was not completed till 1836. In 1834, on a vacancy being made in the representation of Leeds by the appointment of Mr. T. B. Macaulay (now Lord Macaulay) to be one of the commissioners in India, Mr. Baines was chosen member in opposition to Sir John Beckett, after a severe contest. In the House of Commons he maintained the character he had acquired as a journalist, and though not a brilliant speaker, his integrity, independence, industry, and conciliatory manners, with his clear connection with the dissenting interest, made him an influential member. In January 1835 he was re-elected, and again in 1837. Though generally supporting the Whig party, he was opposed to them in their schemes for public education, which he always contended would be best effected by voluntary subscriptions, and viewed the assistance lent by the State as tending to give an undue domination to the Established Church. In 1841, his health having suffered from the sedulous performance of his parliamentary duties, he retired from the representation, and proposed Mr. Hume as his successor, who however was defeated. In September of that year his friends in Leeds presented him with an elegant silver service as a testimony of their recognition of his services. From that time he retired to some extent from public life, but continued to take an active part in local affairs, both as a magistrate and a poor-law guardian, in both capacities promoting social improvements as far as lay in his power; and he was always ready to interpose as mediator between the men and their employers in the many strikes that took place in the north, representing to the men the folly of their having recourse to violence in endeavouring to effect their objects, and pointing out the great chance of placing the men in as comfortable a position as the circumstances would allow. In 1845 the 'Leeds Mercury' warned the speculators of the danger attending the railway mania, though fully acknowledging the advantages of the railway system. He saw that though the facility of communication was a great good, yet that if it became a mere trifle for premiums, it was likely to produce much distress. In 1846, though he had declined to accept the office, his fellow-townsmen chose him for alderman as a mark of their respect, but he immediately resigned the office. In 1847 he again opposed Sir John Russell's scheme for state education of the poor, and the opposition of the dissenters was so strong that the plan was withdrawn. On August 3, 1848, after a long life of usefulness, and after a short illness, he died, and was honoured by a public funeral.

BAINES, MATTHEW TALBOT, the eldest son of the preceding, was born at Leeds in 1799. He was educated at various provincial schools, and then proceeded to Cambridge, where he graduated with honours in 1820. He adopted the profession of the law, entered himself at the Inner Temple, and was called to the bar in 1825. He went the Northern Circuit as a barrister, and attended the West Riding Sessions with considerable success. In 1837, on the death of the recorder of Leeds, he was recommended by the town-council to succeed him; but Lord John Russell, then secretary of state, thought his intimate connection with the town an objection, and he therefore removed the recorder of Hull to Leeds, and gave the recordership of Hull to Mr. M. T. Baines. In 1847 he was elected member of parliament for Hull, and towards the end of 1848 he was appointed to succeed Mr. Charles Buller as President of the Poor-Law Board. In February 1852 he resigned office with the rest of the Russell ministry, and on the election of a new parliament he was elected member for Leeds, for which place he still sits. On the defeat of the Derby ministry in the House of Commons on December 16, 1852, and the accession of the Earl of Aberdeen, he was re-appointed to his previous office, which he held till the ministry was re-organised under Viscount Palmerston in 1855. He remained out of office till 1856, when he was made Chancellor of the Duchy of Lancaster, with a seat in the cabinet.

*BAINES, EDWARD, the second son of Edward Baines, was born in Leeds, in 1800. He early became assistant of his father in the management of the newspaper, was taken into partnership in 1827, and has conducted it since his death on the same principles that governed it during his father's life. It has always been an active organ in opposing all schemes for state interference with the education of the poor. Mr. Baines is the author of a valuable work, 'The History of the Cotton Manufacture,' published as a volume in 1835, but which was originally written as a part of his father's History of Lancashire; and also a Life of his father, published in 1851, to which we have been indebted for many of the facts in the preceding notices. [*See* SUPPLEMENT.]

*BALFE, MICHAEL WILLIAM, a popular dramatic composer, was born at Dublin in 1808. He showed precocious musical talent, and at nine years old composed a ballad, called 'The Lover's Mistake,' which was sung with great applause by Madame Vestris in 'Paul Pry.' He became known to the London public as a juvenile violin-player, and obtained an engagement in the orchestra at Drury-Lane Theatre, then conducted by Mr. Thomas Cooke. Having a fine baritone voice, he appeared on the boards of that theatre with success. He then went to Italy, where he resided a good many years, during which he sang at the principal theatres of that country. In 1835 he returned to England, and produced at Drury-Lane his first opera, 'The Siege of Rochelle,' which became highly popular, and established his reputation as a composer. His next opera was 'The Maid of Artois,' in which Madam Malibran achieved one of her greatest triumphs in this country. Since that time he has resided chiefly in London, with lengthened visits to Paris, Germany, and Italy; and has produced a long succession of Operas, of which the most remarkable are, 'The Bohemian Girl' (which has gained an European celebrity), 'Catherine Grey,' 'Falstaff' (an Italian opera produced at the King's Theatre), 'Keolanthe,' 'The Daughter of St. Mark,' 'The Enchantress,' 'The Bondman,' and 'The Rose of Castille.' This last (written in three weeks for the English Opera House at the Lyceum, under the management of Miss Pyne and Mr. Harrison), was produced in October of the present year, and is now (December 1857) "running" with brilliant success. Mr. Balfe has also composed several operas for the Parisian stage; particularly 'Le Puits d'Amour,' 'Les Quatre Fils d'Aymon,' and 'L'Etoile de Seville.' He has had great success at the Opera Comique. Balfe's style as a composer is light, melodious, and animated. He strongly resembles Auber, with whose works several of Balfe's may without disadvantage be compared.

*BALFOUR, JOHN HUTTON, Professor of Botany in the University of Edinburgh, was born in Edinburgh, and educated for the medical profession in the university of that city. Although intending to practise his profession, he took a great interest in the study of botany, and was one of the most distinguished pupils of the late Professor Graham. After taking his degree of Doctor of Medicine he commenced the practice of his profession in his native city. He still however pursued the science of botany and in conjunction with the late Professor Edward Forbes and other ardent young naturalists, founded the present Botanical Society of Edinburgh. This society has done very much towards promoting the private study of British plants by distributing amongst its members specimens as well as publishing properly classified lists of British plants. On the appointment of Sir William Jackson Hooker to be superintendent of the Botanical Gardens at Kew, the chair of botany in Glasgow became vacant. Dr. Balfour offered himself as candidate, but was eventually appointed to the professorship. On the death of Professor Graham he became a candidate for the chair of Botany in Edinburgh, and after a sharp contest in which he was opposed by Dr. Joseph Hooker, he was elected to this position. Since his appointment Professor Balfour has shown great energy in the direction of the Botanic Gardens of Edinburgh, which are placed under his superintendence, and also in the instruction of the medical class in the science of botany.

Dr. Balfour has written several works on botany. He contributed the articles on botany to the last edition of the Encyclopædia Britannica. In 1849 he published a 'Manual of Botany,' intended to be employed as a text-book to his course of lectures on botany in the university. Several editions of this book have since been published, but not edited by the author, as from some misunderstanding with his publisher, Dr. Balfour withdrew his interest from the work. He subsequently, in 1852, published a 'Class-Book of Botany,' having the same object in view as the first work. An epitome of this work, under the title of 'Outlines of Botany,' has also been published. In addition to these works Dr. Balfour has published many papers in connection with the Botanical Society of Edinburgh and the British Association for the Advancement of Science. He is a Fellow of the Royal Societies of London and Edinburgh, also of the Linnean Society of London.

BEAUFORT, REAR-ADMIRAL SIR FRANCIS, K.C.B., F.R.S. &c., late Hydrographer to the Admiralty, is the son of the Rev. Daniel Augustus Beaufort, rector of Navan, county of Meath, Ireland, and author of a Map of Ireland, published with a Memoir, in 1792, as well as of some theological publications. Francis Beaufort entered the navy, in June 1787, as a volunteer on board the Colossus 74, stationed in the Channel. He was made midshipman in June 1790, and while holding that rank saw much active service, assisting among other duties in the capture of several vessels. In May 1796 Beaufort was created lieutenant, and whilst acting as first lieutenant of the Phaeton, 38 guns, he, having under his orders a barge and two cutters, boarded and took the San Josef, a Spanish polacre rigged ship of 14 guns and 56 men, which lay moored under the protection of five guns of the fortress of Fuenzirola, near Malaga, supported by a French privateer. Lieutenant Beaufort in this brilliant affair received a wound in his head, and several slugs in his body and left arm; but was recompensed by obtaining, as a recognition of his skill and courage, a commander's commission. During a

Digitized by Google

cessation from service afloat, he was engaged from November 1803 to June 1804 in superintending the construction of a line of telegraphs between Dublin and Galway. In June 1805 he proceeded as commander of the Woolwich 44 guns, to the East Indies, and thence to the Rio de la Plata, of which river he made during the campaign of 1807 a very valuable survey. He was afterwards stationed at the Cape of Good Hope, and in the Mediterranean. In May 1809 he was appointed to the command of the Blossom, and the following year with the rank of Post Captain to the command of the Frederickstein frigate. During 1811-12, he was engaged in making a minute survey of the coast of Karamania in Asia Minor, but was compelled in the latter year to return home in consequence of wounds inflicted on him by a fanatic Musselman.

In the course of these services Captain Beaufort had obtained a very high rank, as a scientific as well as a brave seaman, and equally so as a hydrographer and geographer. He was now consequently called upon by the Board of Admiralty, to devote himself to working out and embodying in a series of charts, the results of his various surveys. Among other charts constructed by him were one of the Archipelago, three of the Black Sea, including the coast of Asia, and seven of Karamania, these last being accompanied with a 'Memoir of a Survey of the Coast of Karamania in 1811 and 1812.' In 1817 he published in 8vo, a fuller and more elaborate work on the same district: 'Karamania; or a brief Description of the South Coast of Asia Minor, and of the Remains of Antiquity, &c., with plans, views, &c.' His labours and scientific merits found their appropriate reward in his elevation, in July 1832, to the post of Hydrographer to the Admiralty, which important office he imparted new honour by the manner in which he fulfilled its duties; and which he continued to hold till he retired full of years and honours on the 30th of January 1855, having very nearly completed his 68th year of service. He was succeeded by Captain Washington [WASHINGTON, CAPTAIN JOHN]. In April 1835, Captain Beaufort was appointed Commissioner for inquiry into the Laws, &c. affecting Pilots; and in January 1845 a Commissioner for inquiry into the Harbours, Shores, and Rivers of the United Kingdom. He was created rear-admiral, October 1st, 1846.

Admiral Beaufort, besides his memoirs on the coast of Karamania, &c., has contributed papers to the Geographical and other learned Societies; and the important collection of Maps of the Society for the Diffusion of Useful Knowledge was executed under his supervision. He was elected a Fellow of the Royal Society in June 1815; he is also a Member of the Council of the Geographical Society, a Fellow of the Royal Astronomical Society, a Corresponding Member of the Institute of France, &c. [See SUPPLEMENT.]

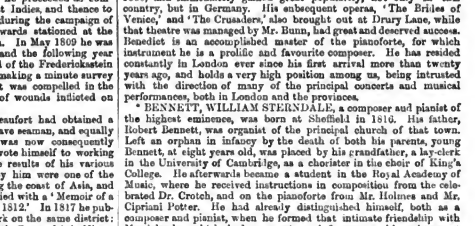
BEHNES, WILLIAM, the eminent English portrait sculptor, was born about the beginning of the present century. He was a student in the Royal Academy, where in 1819 he gained the silver medal for the best model of an academy figure from the life. He early distinguished himself by his busts, and though he has occasionally executed poetical and classical statues, he is to his portrait busts that his celebrity is mainly owing. His sitters have included a large number of the most eminent men of the day. Among statesmen and lawyers he has produced busts (some of them of colossal size,) of Wellington and Peel; Lords Eldon, Stowell, and Lyndhurst; Joseph Hume and Benjamin Disraeli; Sir William Follett, Frederick Pollock, Sir John Jervis, Sir Fitzroy Kelly; Sir William Molesworth, Thomas Clarkson, Chevalier Bunsen; among prelates, of the Archbishops of Canterbury and Armagh, the Bishops of London, Norwich, Llandaff, Carlisle, and Calcutta; among artists and literary men, of Benjamin West, Northcote, Sir Charles Barry, George Cruikshank, Samuel Rogers, Dr. Croly, George Grote, Macready, Colonel Leake, Sir John Barrow; among surgeons, Earl, Carpue, Travers, Dr. Babington, &c.; among members of the fashionable world, the Countess of Chesterfield, the Countess of Malmesbury, Count D'Orsay, &c.; civic dignitaries, as Aldermen Venables, Lucas, Pirie, Moon, &c. Mr. Behnes has likewise executed several important memorial and monumental statues, among others, of Gresham, at the Royal Exchange, of Sir William Follett, of Lord William Bentinck, and of the colossal statues of Sir Robert Peel, in Cheapside, London, and at Leeds. Of his imaginative statues it will be enough to mention his 'Lady Godiva,' 1844; 'Europa,' 1848; and 'The Startled Nymph,' 1849. Mr. Behnes may be safely placed at the head of living portrait-sculptors—at least as far as regards busts. His style is bold and masculine, but at the same time is generally admirable. Whilst giving the characteristic likeness, he is happy in preserving the more intellectual expression of the sitters, and to his chisel posterity will owe the permanent record of the happiest likeness of several of the most distinguished men of the last and present generations. [See SUPPLEMENT.]

* BENEDICT, JULES, one of the most distinguished foreign musical composers who have devoted their genius chiefly to the English stage, was born at Stuttgart in 1805. After having begun his studies under Hummel, he received instructions from Weber, and became a favourite pupil of the author of the 'Freischütz.' At nineteen, he was, on Weber's recommendation, engaged as conductor of the German opera at Vienna; and afterwards employed in a similar capacity at the two principal theatres (the San Carlo and the Fondo) of Naples. He came to London in 1835; and his first occupation was to conduct the performances of an Opera Buffa carried on for two seasons at the Lyceum by Mr. Mitchell of Bond-street. His first English opera, 'The Gipsey's Warning,' was produced at Drury Lane in 1838, and immediately gained great popularity, not only in this country, but in Germany. His subsequent operas, 'The Brides of Venice,' and 'The Crusaders,' also brought out at Drury Lane, while that theatre was managed by Mr. Bunn, had great and deserved success. Benedict is an accomplished master of the pianoforte, for which instrument he is a prolific and favourite composer. He has resided constantly in London ever since his first arrival more than twenty years ago, and holds a very high position among us, being intrusted with the direction of many of the principal concerts and musical performances, both in London and the provinces.

* BENNETT, WILLIAM STERNDALE, a composer and pianist of the highest eminence, was born at Sheffield in 1816. His father, Robert Bennett, was organist of the principal church of that town. Left an orphan in infancy by the death of both his parents, young Bennett, at eight years old, was placed by his grandfather, a lay-clerk in the University of Cambridge, as a chorister in the choir of King's College. He afterwards became a student in the Royal Academy of Music, where he received instructions in composition from the celebrated Dr. Crotch, and on the pianoforte from Mr. Holmes and Mr. Cipriani Potter. He had already distinguished himself, both as a composer and pianist, when he formed that intimate friendship with Mendelssohn which had so great an influence on his subsequent progress in his art. In 1836, by Mendelssohn's invitation, he went to Leipsic, where the famous Gewandhaus concerts were then directed by that illustrious composer. At those concerts several of Bennett's orchestral and pianoforte works were performed; and their success laid the foundation of that reputation which he now enjoys in Germany. During the last twenty years he has gained the highest honours and most solid fruits of his profession, as a composer, a performer, and an instructor. His published works are numerous; consisting of orchestral overtures, concertos, sonatas, and studies for the pianoforte, and songs, duets, and other vocal pieces. In 1856, on the death of the late Dr. Walmsley, he was elected Professor of Music in the University of Cambridge, and likewise received the degree of Doctor of Music. Having a due sense of the importance and responsibility of his office, he has already given a fresh impulse to the cultivation of music in that university, and his future labours promise material effects on that art as a subject of academic tuition. Dr. Bennett is also one of the Professors of the Royal Academy of Music, and conductor of the orchestra of the Philharmonic Society, in which last capacity he has conduced greatly to the prosperity of that celebrated body, whose concerts, for half a century, have been renowned throughout Europe.

BERNOULLI, the name of a family which is known in the history of mathematics by the services of eight of its members. These are not all of equal, or nearly equal celebrity; but it is necessary to notice each, not only to enable the reader to avoid the confusion which so large a number of similar names has introduced into historical writings, but also because a moderate degree of reputation becomes remarkable, when it forms part of so conspicuous a mass. The Cassinis (of whom four are well known in astronomy) present a similar phenomenon in the history of knowledge.

The family of the Bernoullis is said to have originally belonged to Antwerp, and to have emigrated to Frankfort to avoid the religious persecution under the Duke of Alva; it finally settled at Basel. Nicolas Bernoulli, the immediate ancestor of the subjects of this notice, held a high station in that republic, and was succeeded in it by a son, now unknown. He had eleven children, of whom two are the most distinguished of the eight Bernoullis, and another, whose name we cannot find, was the father of a third. But the whole connexion will be better understood by the following genealogical diagram, which includes the common ancestor and the eight descendants in question. The years of birth and death are added:—



However distinguished these men may be, the events of their lives are of comparatively little interest, except as connected with the history of the sciences which they cultivated; and of their works it would be impossible to treat to an extent corresponding to their reputation or utility, without writing the history of mathematics for a century. We shall therefore here confine ourselves—1. To the principal events of their lives. 2. To the mention of such of their researches as are most connected with their personal characters. 3. To a very short account of the position which their labours occupy in the chain of investigation.

Digitized by Google

JAMES BERNOULLI I., was born at Basel, December 27th 1654. His father intended that he should be a divine, and had him taught the classics and scholastic philosophy, but no mathematics. Accident threw geometrical books in his way, and he studied them with ardour in spite of the opposition of his father. He took for his device Phaëton driving the chariot of the Sun, with the motto 'Invito patre sidera verso.' At the age of twenty-two he travelled to Geneva, and from thence to France. It is recorded of him that at the former place he taught a blind girl to write, and that at Bordeaux he prepared geometrical tables. At his return, in 1680, he began to study the philosophy of Descartes.

The comet of 1680 drew from him his 'Conamen Novi Systematis,' &c., an attempt to explain the phenomena of those bodies. He imagined that they were satellites of a planet too distant to be visible, and thence conjectured that their returns might be calculated. With regard to the question of their predictive faculties, he supposes that the head of the comet, being durable, denotes nothing, but that the tail, being accidental, may be a symbol of the anger of heaven. M. Fontenelle, as became the writer of an éloge, calls this a "ménagement pour l'opinion populaire;" but we cannot follow him in viewing it as such. In 1682 he published his treatise 'De Gravitate Ætheris,' now of little note. His lasting fame dates from the year 1684, in which Leibnitz published his first essays on the Differential Calculus in the Leipzig Acts. From this time he and his brother John applied themselves to the new science with a success and to an extent which made Leibnitz declare that it was as much theirs as his. In 1687 he was elected professor of mathematics at the University of Basel. His celebrity attracted many foreigners to that place, and his researches on the theory of series were investigations undertaken as official exercises.

The integral calculus was first inquired into by James Bernoulli, in two essays published in 1691. His future labours were, in a great measure, developments of the inexhaustible method of investigation just named. Of that part which concerns his brother as well as himself we shall presently speak. He died at Basel of a slow fever, August 16, 1705, in his fifty-first year. After the example of Archimedes, he ordered that one of his discoveries should be engraved on his tomb. It was a drawing of the curve called by mathematicians the logarithmic spiral, with the inscription 'Eadem mutata resurgo:' a double allusion, first, to his hope of a resurrection, next, to the remarkable properties of the curve, well known to mathematicians, which consist in this, that many curves which, in most instances, convert one curve into another, in the logarithmic spiral only reproduce the original.

M. Fontenelle, his contemporary, says, "M. Bernoulli was of a bilious and melancholy temperament, a character which, more than any other, gives the zeal and perseverance necessary for great labours. . . . In all his researches his march was slow and sure; neither his genius nor his habit of success inspired him with confidence; he published nothing without handling it over and over again; and he never ceased to fear the public which held him in so much veneration." It is worth while to observe that the above was written in the year of his death, and before the opportunity of reviewing his brother's career could furnish temptation to exaggerate points of contrast; and before we quit this subject, we may observe that the career of James Bernoulli is, on one point, a contradiction to a favourite theory, a consequence of the generalising spirit in which biographies are frequently written. The qualities of the man in question, be he who he may, are made the necessary accompaniments of all who distinguish themselves in a similar way. Thus, because several great mathematicians have originated their best discoveries when very young, it is laid down as a sort of law of nature that they should always do so: but James Bernoulli did nothing which would have made him famous, even among contemporaries, till after he was thirty years old, and then not from a principle of his own, but from a hint thrown out by Leibnitz, and which [BARROW] we might almost imagine his own genius would have seized. Yet he is one of the most original mathematicians that ever lived.

He was married, and left a son and daughter. His 'Ars Conjectandi,' one of the earliest works on the theory of probabilities, and his treatise on series, were published posthumously in 1713, under the care of Nicolas Bernoulli the elder. Part of it was republished by Baron Maseres in 1795, in a volume of tracts. His complete works were published at Geneva, in two vols. 4to, 1744. There is a letter of his in the 'Journal de Physique,' September, 1792, which will be presently alluded to. He edited the geometry of Descartes, in 1695.

(See *éloge* by Fontenelle, in the collection; the memoir by Lacroix in the *Biographie Universelle*; Montucla, *Hist. des Math.* throughout; and the Preface to Lacroix, *Calc. Diff. et Int.*)

JOHN BERNOULLI I., brother of the preceding, was born July 27th, 1667 (old style). He was the ninth child of his father, who intended him for commercial pursuits, and sent him to the University at Basel in 1683, where, like his brother, he found his own vocation. He was made master of arts in 1685, on which occasion he read a thesis in Greek verse, in refutation, we suppose, of the divine right, &c., the subject being, that 'the prince is made for his subjects.'

He then studied medicine, and in 1690 published a dissertation on effervescence and fermentation; but he soon began to apply himself to mathematics. In 1690 he travelled to Geneva and into France, where he formed many acquaintances, with such men as Malebranche, the Cassinis, De l'Hôpital, &c. He returned to Basel in 1692, and from that time dates his correspondence with Leibnitz. It is well known how strenuously he defended the cause of the latter in the dispute about the invention of fluxions, and the vigorous war of problems which he maintained with the English school. In 1693 (our authority the 'éloge' of the Berlin Academy, in Formey's collection of 1757, says 1691, but this must be a misprint) he was elected professor of mathematics at Wolfenbüttel; but on his marriage with a lady of Basel, named Dorothea Falckner, March 6th 1694, he returned to his own country, was received doctor of medicine, and kept a public act on the Motion of the Muscles.

In 1695 he accepted a professorship at Groningen, at which place he remained till he succeeded his brother James at Basel in 1705, where he died January 1st 1748. We shall have to speak of five of his descendants. He published no separate works, but his memoirs are to be found in all the scientific transactions of his day. They were collected in four quarto volumes by Cramer, and published at Lausanne and Geneva in 1742. His correspondence with Leibnitz was published in two vols. 4to, at the same places, in 1745.

The author of the 'éloge' already cited says, that the qualities of his heart were not less estimable than those of his head, and that he was "juste, droit, sincère, et pieux." To the last quality he has an undoubted right; but his whole history is an unfortunate example of impetuosity of temper and narrowness of mind, which betrayed him into a want of fairness, almost amounting to baseness. The assertion of the eulogist, that he was generous, is a desirable specimen of the extent to which such productions may be trusted as to points of personal disposition and manners. The celebrated dispute with James Bernoulli is of a character unique in history, and forms an episode so characteristic of the state of science at the period, as well as of the dispositions of the two celebrated brothers, that it is worth while to dwell a little upon it.

Before the mathematical sciences were possessed of general methods of investigation, problems of which hundreds are now soluble by one process, were so many separate questions with separate difficulties. It was the practice of centuries for mathematicians who had found a particular solution of any case, to propose the question as a challenge to others. In the years preceding 1696 John Bernoulli had showered new problems upon the world, which, though addressed to all, were generally considered as particularly directed at his elder brother, of whose established reputation he seems to have been jealous. In 1696 John Bernoulli proposed the well-known problem of the *brachistochron*, or "to find the curve on which a material point will fall from one given point to another in the least possible time." This was answered by Leibnitz, Newton, James Bernoulli, De l'Hôpital; but with the third his upon a method of solving more general questions of the same kind; and feeling perhaps that it was time to assert the superiority which his age and reputation might be supposed to give him, proposed a counter-challenge with his solution. It was a problem of a much more general and abstruse character, one limited case of which is the following:—"Of all the curve lines which can be described on a given rectilinear base, and of a given length, to find that which contains the greatest area." He added another, which amounted to asking for the curve of quickest descent, not from a point to a point, but from a point to a given straight line; and ended by stating that a person of his acquaintance (probably himself) would give his brother due praise, and fifty florins besides, if he would solve these problems within three months, and publish his solutions within a year. John Bernoulli, in another publication immediately afterwards (for private correspondence between the brothers had ceased), praises the solutions which Newton, Leibnitz, and De l'Hôpital had given of his problem, and admits the correctness of that of his brother, but reproaches him with the time he had employed upon it. He goes on to say, that as to his brother's new problems, they were in reality contained in his own; that difficult as they might appear, he had immediately overcome them; and instead of three months, it only took him three minutes to penetrate the whole mystery. He sent the results of his solutions accordingly, and required fulfilment of his promise; adding, that as it had cost him too little trouble to gain the money, he should give it to the poor. He had in fact solved the second problem, which, as he truly stated, is not of difficult deduction from his own; but he deceived himself as to the first. James Bernoulli quietly answered, in the 'Journal des Savans' for February 1698, that his brother's solution was wrong; that if no one published any further solution he would engage, 1, to find out what his brother's method had been; 2, whatever it was, to show that it was wrong; 3, to give a true solution of the problem. And he added, that whatever sum any one would undertake to give him for succeeding in each of the three undertakings, he would forfeit as much if he failed in the first, twice as much if he failed in the second, and three times as much if he failed in the third. The positive tone of this announcement alarmed John Bernoulli, who well knew that his brother was not a man to be much mistaken when he spoke so strongly; and he accordingly looked again at his solution, corrected it as he thought, admitted that he had been too precipitate, and again demanded the reward. He proposed also another problem, for the solution of which he offered 200 florins,

Digitized by Google

if done within the year. James Bernoulli replied, "I recommend my brother to look again at his last solution, and to say whether he still thinks it right; and I declare that when I shall have published mine, pretexts of precipitation will not be listened to." John Bernoulli answered, that he would not revise his solution, and that his time was better employed in making new discoveries. James Bernoulli replied, that if in *three minutes* he had solved the whole mystery, surely *six minutes* more would not much diminish the number of his new discoveries. After some further communications, in the course of which John Bernoulli sent the demonstration of his solution to Leibnitz (who declined giving any positive opinion), and declared that he would say no more on the subject, James Bernoulli published his own solution, with those of other problems, without demonstrations, in the Leipzig Acts for June 1700. He also printed at Basel a letter to his brother, in which he invites him to publish his method, and sends his own solution, without demonstration. John Bernoulli, though now in possession of the true result, could not see where he was wrong; perhaps *would not*, for a material part of this letter was suppressed *at his desire* in the posthumous edition of his brother's works. (It was reprinted whole in 1792, as already mentioned.) John Bernoulli replied by sending his own demonstration under cover to the Academy of Sciences at Paris, to be opened so soon as his brother should send his. On this, James Bernoulli (March 1701) published his own solution at Basel, and also in the Leipzig Acts *with the demonstration*. De l'Hôpital and Leibnitz immediately admitted its correctness, and made John Bernoulli acquainted with their opinion. But no opinion could be had from the latter: he continued obstinately silent as long as his brother was alive; nor was it till 1706, after the death of James Bernoulli, that he published an incorrect solution in the memoirs of the academy. The inference is obvious, that he suspected the incorrectness of his own method, and was afraid to expose it to the searching eye of his brother; but that when the latter was dead, he did not fear that any other person in Europe would be able to expose him. As late as 1718 he published a correct solution, and admitted that he had been mistaken; but he had not the fairness to add, that his new solution was only that of his brother in another shape.

After the preceding account, which is now undisputed, the reader will not be surprised to be told that after the deaths of Leibnitz and De l'Hôpital, their beosm friend John Bernoulli endeavoured to rob them both. He claimed to be a contemporaneous inventor of a method of the former (that which was called the *differentiatio de curva in curvam*), of which he had said in admiration, when it was first produced, that "the god of geometry had admitted Leibnitz farther into his sanctuary than himself." And here too, if either of the bystanders can be said to have invented that method so as to cheat Leibnitz, it was *James* Bernoulli. He also advanced an absurd pretension to be the author of all that was new in the 'Analyse,' &c., of De l'Hôpital, a claim which merits no refutation. He was jealous of his own son, Daniel Bernoulli, who divided with him the prize of the Academy of Sciences in 1734, and was displaced that he turned Newtonian. The following anecdote is related by Condorcet, we know not on what authority, but we believe it:—"One day he proposed to his son Daniel, then a youth, a little problem to try his strength; the boy took it with him, solved it, and came back expecting some praise from his father. *You ought to have done it on the spot*, was all the observation made, and with a tone and gesture which his son remembered to the latest day of his life." The only instance which has ever fallen within our reading, in which John Bernoulli showed himself free from petty jealousy, was in his treatment of Euler, when the latter was his pupil at Basel. Observing his talent for mathematics, he encouraged it, and gave him private lessons, in addition to those of the public course.

In thus displaying a character which appears to have no one amiable point about it, we depart from the common practice, which is never to admit, if by any softening it can be helped, that great intellect is not accompanied by greatness of mind in other respects. But it is not good to substitute falsehood (and coloured truth is falsehood) for truth, and it is not good for the living to know that literary or scientific reputation covers moral obliquity as soon as the grave has covered the body. D'Alembert, who, in the form of an *éloge*, has written an excellent account of the *mathematical* character of John Bernoulli, has deservedly evaded this difficulty:—"Bernoulli was only known to me by his works; I owe to them almost entirely the little progress I have made in geometry. Not having had any kind of acquaintance with him, I am ignorant of *the uninteresting details of his private life*." Speaking of the celebrated dispute above related, he says, "This altercation produced several pieces in which bitterness seems to have taken the place of emulation; but as one of the two must have been in the wrong, one of the two must have been in a passion." He only forgets to state, what he himself knew as well as any body, that the "one of the two" was the subject of the *éloge*, and his *protégé* for the time being.

In concluding what we mean to say on the two brothers, who stood at the head of their family, we may observe that it is clear that both are and the other had pushed their researches in the infinitesimal analysis far beyond the view of any other men of their time. Newton had abandoned the sciences, and Leibnitz, the other inventor, though he could decide between the right and the wrong, would not commit himself by an opinion on the solution of John Bernoulli only, but contented himself with stating that it seemed to him to be correct, but that he could not give it sufficient attention to speak positively. Of the two brothers, the elder was certainly the deeper and the more correct; the younger the quicker and the more elegant. The works of John Bernoulli, who lived much longer than his brother, contain an immense mass of discovery; but there is no particular on which we could dwell for the benefit of the general reader: the mathematician should consult the *éloge* of D'Alembert already alluded to.

NICOLAS BERNOULLI II. (to distinguish him from his cousin of the same name), the eldest son of John Bernoulli, was born on the 27th of January 1695, at Groningen. His name to Basel with his father in 1705, as a student, and studied at the university on an intimate friendship with the afterwards celebrated Euler. In 1725 he was invited to St. Petersburg by the Empress Catherine, with his brother Daniel. But he had hardly time to do more than show that he had the talents of his family, when he died, on the 26th of July 1726, at St. Petersburg. For his *éloge* see 'Comm. Acad. Petrop.,' v. ii., and for some memoirs of his, see vol. i. There are some of his memoirs in his father's works. (See the 'Biographia Universalis.')

DANIEL BERNOULLI, the second son of John, was born at Groningen, February 9, 1760. His father at first intended that he should apply himself to trade, but his objections to that course of life prevailed, and he was allowed to study medicine. He had received some instruction in mathematics from his father; we have already seen how. After passing some years in Italy, professedly employed upon medicine, but really upon mathematics, he returned to Basel. He could not at this time have been actually known as a mathematician by any decided effort of his own; but it was sufficient that he was a Bernoulli, for we are told that before he was twenty-four years old he had refused the presidency of the Academy of Sciences at Genoa. The following year he and his brother Nicolas were invited to St. Petersburg, as already mentioned. He appears not to have been well satisfied with the half savage court of Russia, and had made up his mind to quit it; but the empress, who wished him to remain, increased his salary, and gave him full liberty to retire on the half of it whenever he pleased. He thus obliged in honourable manner, he returned to Basel. He found at Petersburg till 1733, when the state of his health compelled him to return to his country. Here he obtained, first a chair of medicine, and afterwards of natural philosophy, to which was subsequently added one of mathematics.

He had published, in 1724, his first work, entitled 'Exercitationes Mathematicæ,' in the title-page of which he styled himself 'son of John Bernoulli,' which title he always afterwards continued. His succeeding essays on mechanics were the first in which motion is considered into that of translation and that of rotation. He entered into the theory of compound oscillations, and is the first who applied mathematics to a species of considerations which have since become of the greatest utility and singularly extensive application. His 'Hydrodynamique,' published in 1738, is the first work in which the motions of fluids are reduced to a question of mathematics. It is in one point like the subsequent work of Lagrange (the 'Mécanique Analytique'): in that work the whole question is reduced to the results of one principle, which, in the work of Daniel Bernoulli, is called the 'conservation of vis viva.'

In the theory of probabilities he introduced what is known by the name of the 'moral probability,' which estimates a loss or gain, not absolutely, but by its proportion to the fortune of the person who stands the risk. His paper on inoculation, published in 1760, was one of the first in which a science whose practical utility is great though difficult for the world at large to see, is applied to a question of statistics. On this subject he added to the methods which had begun to appear for the evasion of the difficulties arising from the necessary introduction of very large numbers into questions of combinations.

Daniel Bernoulli gained or divided the prize of the Academy of Sciences ten times; once (in 1734) in company with his father, on the question of the physical cause of the smallness of the planetary inclinations, by which, as before remarked, he excited jealousy in a quarter from whence admiration should have been most certain. His memoir has been considered the better of the two; and Condorcet observes, that he knew this, and showed that he knew it, which was not quite decorous. In 1740 he shared with Euler and Maclaurin the prize for a dissertation on the tides; and their three memoirs, which are all celebrated, contain all that was done on the theory of that subject between the writings of Newton and Laplace.

In 1748 he succeeded his father as member of the Academy of Sciences, in which he was succeeded by his brother John; so that for more than ninety years the foreign list of that body always contained a Bernoulli.

Daniel Bernoulli was found dead in his bed by his servant, March 17, 1782, having in his latter years been subject to asthma. He was never married, the only engagement of that sort which he ever contemplated having been broken off by him on the discovery that his intended wife was avaricious. In religion he was said by the clergy of his town to be a freethinker, a rumour which he never took any steps either to prove or disprove. But his conduct and talents had gained him so much respect among his fellow-citizens, that to take off the hat to Daniel Bernoulli was one of the first lessons inculcated upon the children of Basel.

Digitized by Google

The following anecdotes were related by himself, and he asserted that his self-love was more flattered by the incidents they sustain than by all his prizes. When he was a young man on his travels, he talked with a stranger whose curiosity was excited by his conversation, and who asked his name. "I am Daniel Bernoulli," answered he. The stranger, thinking from his youthful looks that he could not be so celebrated a man, and wishing to answer the supposed hoax by one still better, replied, "And I am Isaac Newton." The other is as follows:—Koenig, then well known as a mathematician, was dining with him, and talking with some pride of a very difficult question, which it had taken him a long time to solve; Bernoulli went on attending to his guests, and before they rose from table furnished Koenig with a solution of his question. (See the 'Éloge' of Daniel Bernoulli by Condorcet.)

JOHN BERNOULLI II., third son of John Bernoulli I., born at Basel, May 18, 1710, died there July 17, 1790. He studied law and mathematics, and was successively professor of eloquence and of mathematics. Three of his memoirs gained the prize of the Academy of Sciences.

JOHN BERNOULLI III., his son, born at Basel, November 4, 1744, died at Berlin, July 13, 1807. At nineteen years of age he became a member of the academy of Berlin. He devoted himself particularly to astronomy, and his numerous observations are in the Berlin 'Memoirs' and 'Ephemerides.' He gave an edition of the algebra of Euler: his 'Lettres sur différents sujects,' &c., 1777—1779, contain much information on the state of observatories. There is a list of his works in the 'Biographie Universelle.'

JAMES BERNOULLI II., second son of John Bernoulli II., born at Basel, October 17, 1759, was the deputy of his uncle Daniel in his professorship, when the latter became infirm, but did not succeed him, owing to candidates being then chosen by lot. He was afterwards professor of mathematics at St. Petersburg, and married a grand-daughter of Euler. His memoirs in the Petersburg transactions had begun to show that he had the talent of his predecessors, but he died of apoplexy while bathing in the Neva, July 17, 1789. His 'éloge' is in the 'Nov. Act. Petropol.' vol. vii. ('Biog. Univ.')

NICOLAS BERNOULLI I., nephew of the two first Bernoullis, was born at Basel, October 10, 1687, died there November 29, 1759. He was professor of mathematics and logic at Padua, afterwards of law at Basel. There are some of his writings among those of John Bernoulli.

In concluding this article we shall remark that the two elder Bernoullis lived during the time while the mathematics were in a state of growth towards the power which was attained by the end of the century. No two men contributed more to this work; and it is the integral calculus, as received from their hands, which became the instrument of their successors. They are of the age of Newton and Leibnitz: Daniel Bernoulli, on the other hand, is the contemporary of Clairaut, Euler, and *D'Alembert*; and in the hands of these four, the new calculus was applied to investigation of material phenomena. The circumstances of the times required such men, and there is no question that they must have appeared; but that they should all three have come from one family was not to be looked for, and furnishes an instance of consanguinity of talent of one kind, which must excite the curiosity even of those who care little for the subjects on which it was employed.

BINGHAM, JOSEPH, a very learned clergyman, was born in September 1668, at Wakefield, Yorkshire, and educated first at the grammar-school of his native town, whence he removed, in 1683, to University College, Oxford. He graduated B.A. in 1687, was soon after elected Fellow of his college, and in 1690 proceeded M.A. In 1690 he was presented to the rectory of Headbourne-Worthy, near Winchester, Hampshire; and in 1712 to that of Havant, near Portsmouth. He obtained no further preferment; and died, August 17, 1723. The work on which the fame of Bingham is based is his 'Origines Ecclesiasticæ; or the Antiquities of the Christian Church,' a work displaying a profound acquaintance with the Fathers and early ecclesiastical historians, and marked by sound judgment as much as by extensive reading. It embraces within its scope nearly the whole range of questions connected with the doctrines and discipline of the early Church, and is unquestionably one of the most learned works on Christian antiquity produced by a member of the English Church. It was originally published in 10 vols. 8vo, 1710-22; and was translated into Latin—the citations being for the first time given at length—by Grischovius, with a preface by J. P. Buddeus, in 10 vols. 4to, Halæ, 1724-29, and again in 1751-81. An edition, in which the additions and corrections left by Bingham were for the first time incorporated, was published by his great-grandson, the Rev. Richard Bingham (who prefixed a Life of the author), in 8 vols. 8vo, 1821-29. Another edition, by the Rev. R. Pitman, appeared in 9 vols. 8vo, London, 1838-39, in which the passages referred to are given at length, and some Sermons; 'The French Church's Apology for the Church of England,' which first appeared in 1706; 'A Scholastic History of Lay Baptism,' in two parts, first published in 1712; and other minor works by Bingham are included. The latest edition is one by R. Bingham, jun., in 10 vols. 8vo, Oxford, 1855, in which the editor has verified and quoted the whole of the 15,000 citations contained in the work of his learned ancestor. An abridgment of the Antiquities, by A. Blackamore, appeared in 2 vols. 8vo, in 1722, under the title of 'Ecclesiæ Primitivæ Notitia, or a Summary of Christian Antiquities.'

BONSTETTEN, KARL VICTOR VON, a Swiss author, a native of the German portion of Switzerland, who wrote in both French and German, and produced works of reputation in each language, and who was also remarkable for the number and intimacy of his friendships with noted men, one of whom was the English poet Gray. He was born at Bern, on the 3rd of September 1745, of one of the six privileged patrician families of that republic, of which his father was treasurer. He was the first Bernese child who was subjected to inoculation, by the advice of the celebrated Haller. At Yverdun, where he was sent for his education, he formed an acquaintance with Jean Jacques Rousseau; at Geneva, to which he removed, he became the friend of Firmin Abauzit, the Arian philosopher; and was a frequent guest at the table of Voltaire. Charles Bonnet, author of the 'Contemplations of Nature,' inspired him with a taste for metaphysical analysis, which he afterwards said decided the course of his intellectual life. He took a disgust to Leyden, to the university of which he was sent for his education, and obtained his father's permission in 1769 to make a trip to England. Here the Rev. Norton Nicholls, of Blundestone in Suffolk, the friend of Gray, chanced to meet with him at the rooms at Bath, and introduced him, in a letter dated November the 27th, 1769, to the poet, who then resided in much retirement at Cambridge. The consequence was what Mitford calls "a sudden intimacy and romantic attachment" on the part of Gray, the history of which may be traced in the letters between Gray, Bonstetten, Nicholls, first published by Mitford in 1843, in the fifth or supplementary volume of his edition of Gray; and in the letters from Gray to Bonstetten, first given to the English public in 1799 in Miss Plumptre's translation of Matthisson's 'Letters from a Correspondent,' the name which she gives to the German poet's 'Erinnerungen.' These letters it is interesting to compare with Bonstetten's own account of this part of his life, as given in his 'Souvenirs,' written in 1831, more than sixty years afterwards. "I passed some months," he says, "at Cambridge with Gray. I used to see him every day, from five o'clock till midnight. We read together Shakspere, whom he adored, Dryden, Pope, Milton, &c. I told him all about myself and my country, but all his life was shut from me: he never spoke to me of himself." As for reminiscences of his poetry, Bonstetten also says, "was hateful to him; he never permitted me to speak of them." When the young foreigner left for the Continent, Gray accompanied him to London and Dover; and it was on this occasion that an incident took place not without its interest. "Bonstetten told me," says Sir Egerton Brydges in his autobiography, published in 1834, "that when he was walking one day with Gray in a crowded street of the city, about 1769, a large uncouth figure was rolling before them, upon seeing which, Gray exclaimed, with some bitterness, 'Look, look, Bonstetten! the great lexicographer goes Dr. Johnson.'" This was Johnson." In the letters which Gray wrote to his friend after his return, his language was that of the warmest friendship. "My life now," he says in one of them, "is but a conversation with your shadow; the sound of your voice still rings in my ears." In his letters to Norton Nicholls, while he expresses his warm attachment to the young Swiss, whom he calls "the boy," though he was twenty-four years of age, he gives utterance more than once to an opinion that he is "discased in his intellects," and "certainly mad." In the year after their parting, 1771, Gray intended to pay him a visit in Switzerland, in compliance with a warm invitation, but was prevented by the ill health which resulted the same year in his death. Sir Egerton Brydges, who knew Bonstetten about half a century later, and who describes him as "talkative and conceited, but amusing, and, in the common sense, amiable," adds, "he was more like a Frenchman than a German Swiss; I cannot guess how he could be suited to Gray."

Soon after his return home, in 1773, Bonstetten became acquainted with Johann von Müller, then an unknown young Swiss, afterwards the celebrated historian; and one of the most interesting volumes of Müller's works, the 'Briefe eines jungen Gelehrten' (Letters of a Student), consists of his correspondence with Bonstetten, who had a great influence in directing the mind of his friend in the career which led him to fame. The same service which he rendered to Müller was rendered to himself by Matthisson, a poet who inspired Bonstetten Gray in German, and with whom Bonstetten remarks that he lived on the same terms of intimacy as with Gray, though his English friend was thirty years older than himself and his German friend sixteen years younger. By Matthisson's persuasion, Bonstetten commenced author; and his first production, 'Letters on a Swiss Pastoral Country,' published in a German magazine ('Wielands Deutsches Merkur') in 1780, was of such excellence that he never surpassed and seldom equalled it in his subsequent writings. Bonstetten had by this time entered on political life in his native republic; but his ideas were considered too liberal by his colleagues, and his way of supporting them too little conciliatory, and he was also found not to be a good 'man of business.' He was named however in 1787 Landvogt, or political chief, of Nyon, and afterwards supreme judge at Lugano, in Italian Switzerland. In his castle of Nyar, commanding one of the finest views in Europe, he had the satisfaction of providing a lodging for some years for his friend Matthisson, who wrote there some of his finest poems. When the spirit of revolution extended from France to

Digitized by Google

Switzerland, and in March 1798 the republic of Bern was overthrown, he found it advisable to quit Switzerland, and for three years was the guest at Copenhagen of the husband of Friderika Brun, a Danish lady well known in German literature, to whom he had been introduced by Matthisson. It was not till 1802 that he returned to his native country, when he fixed his residence at Geneva, and continued to reside there for thirty years, entirely remote from political and devoted to literary life. From that time he most generally adopted the French language in his published writings in the place of German. His time was passed in making tours of pleasure, including repeated visits to Italy; in publishing different works, which sustained if they did not increase his reputation; and in a constant round of society, in which his company was much sought for. Lord Byron, who saw him at Madame de Staël's at Coppet in 1816, says in a letter to Murray, which is published by Moore, "Bonstetten is a fine and very lively old man, and much esteemed by his compatriots; he is also a littérateur of good repute, and all his friends have a mania of addressing to him volumes of letters—Matthisson, Muller the historian, &c." "There is no creature I can compare to Byron," wrote Bonstetten at the same time to Matthisson; "his voice sounds like music, and his features are those of an angel, only that a little demon of fine sarcasm pierces through—but even that is half good-natured." A volume of letters from Bonstetten to Matthisson was published in 1827, and two volumes to Friderika Brun in 1829-30—all animated, if not profound, and containing a constant stream of literary information and anecdote. In 1832 there appeared in French a volume of 'Souvenirs,' written by Bonstetten in 1831, in his eighty-sixth year, and in which he intended to give a sketch of some of the distinguished persons he had known, of whom, he said, he counted more than eighty before 1773, including, among others who have been already mentioned, the Pope Ganganelli, Charles Edward (the last of the Stuarts), the Countess Albany, Corilla the celebrated improvisatrice, &c.: the 'Souvenirs' were not completed. Bonstetten was carried off by death on the 3rd of February 1832.

The more important works of Bonstetten, which have not been already mentioned, are—'Ueber Nationalbildung' (the nearest translation of which is perhaps 'On National Character'), 2 vols., 1802; 'Voyage sur la scène du dernier livre de l'Enéide' (Travels on the Scene of the last Book of the Æneid, followed by some observations on modern Latium), 1813; 'Recherches, &c.' (Researches on the Nature and Laws of the Imagination), 2 vols., 1807; 'Etudes de l'homme (Studies on Man), 2 vols., 1821; and 'L'Homme du midi et l'homme du nord' (The Man of the South and the Man of the North), 1824. Even his metaphysical works have a sort of autobiographical character stamped upon them by the degree to which they are based on observations which could only be collected by a man of his peculiar circumstances of life. A collection of his smaller writings in German was published at Copenhagen between 1799 and 1801, in 4 vols. The whole deserve to be better known in England.

* BOWERBANK, JAMES SCOTT, a distinguished English naturalist, was born on the 14th of July 1797, at Lime-street, Bishopsgate, London, where his father carried on the business of a distiller. At the age of fourteen he acquired a taste for the study of botany, which, taking him into the country round about London, led him to feel a general interest in the objects of natural science by which he was surrounded. At this time there existed in Spitalfields an association which, under the name of the Mathematical Society, brought together the men of superior intelligence at the east-end of London. Of this society young Bowerbank became a member at the age of eighteen. His energy and intelligence soon placed him a leading man, and he delivered before the society courses of lectures on Systematic Botany and the Anatomy and Physiology of Plants. He continued a member of this society till it effected a junction with the Royal Astronomical Society, and he is one of many who still look back to the scientific and social meetings of the Spitalfields Mathematical Society as the source of their subsequent intellectual life and activity.

Although Mr. Bowerbank has, till within the last few years of his life, been engaged in business, he has found time to make very important original observations, to publish many valuable scientific works and papers, to collect together one of the most valuable geological museums in the country, and to devote a large amount of time to the work of our more important scientific societies. He is an example of one of those men of whom England has so much reason to be proud, who, whilst actively engaged in commercial pursuits have obtained the highest honours in the fields of scientific research. Mr. Bowerbank's original researches have most of them been made by means of the microscope. He has always been amongst the first in this country to expend his ample means on the newest and most recent improvements of the microscope, and was one of the founders of the society established in London for promoting the use of that instrument. One of his earliest literary contributions to science was a paper 'On the Circulation of the Blood in Insects,' in which he was the first to point out the true nature of this function amongst that class of animals. This was published in the first volume of the 'Entomological Magazine.' In the fourth volume of the same journal, a further paper on the 'Circulation of the Blood and the distribution of the Trachee in *Chrysopa Perla*,' was published. Insects furnished also the material for another microscopic paper 'On the Scales of the Wings of the *Lepidoptera*,' published in the fifth volume of the 'Entomological Magazine.'

The interpretation of the history of the earth's surface by means of its extinct animal and vegetable life, has been from an early period a favourite study with Mr. Bowerbank. His earliest investigations were made in the London clay, and were repaid by the discovery of a large number of new forms of plants and parts of plants. These were published in his 'History of the fossil fruits and seeds of the London Clay.' This work was published with figures in 1840.

In natural history Mr. Bowerbank's attention has been especially devoted to the family of sponges. These bodies standing on the limits of the animal and vegetable kingdom, had been neglected by both botanists and zoologists. Through his researches large numbers of these bodies have been brought to light, and the nature of the vital functions they perform, and the structure of their tissues, thoroughly investigated. His papers on this subject are very numerous. In the first volume of the 'Transactions of the Microscopical Society' are two papers, one 'On three new species of Sponges,' and a second 'On the Keratose or Horny Sponges of commerce.' The study of the history of sponges in time, and the past representatives of modern forms, led him to the conclusion that the flints found so abundantly in the chalk formation are most of them fossilised sponges. His views on this subject, although they have been strongly controverted, were published in the sixth volume of the 'Transactions of the Geological Society,' with the title 'On the Siliceous bodies of the Chalk, Greensand, and Oolites.' In this paper he maintains that flints and other siliceous bodies have been formed by the direct deposit of silica from the sponges which are the bottom of the sea. He also threw new also to the formation of agates in a paper published in the third volume of the 'Proceedings of the Geological Society,' 'On Moss Agates, and other siliceous bodies.' Whatever may be the difference of opinion on this subject, no more feasible views than those of Mr. Bowerbank have yet been put forward. He has now engaged on a great work on the British Sponges, which is to contain illustrations and descriptions of every species.

His purely geological papers have been numerous, and are published in the 'Transactions of the Geological Society,' the 'Magazine of Natural History,' and other places. In his geological researches he has constantly had in view the formation of a museum that should illustrate the typical and rarer forms of extinct animals. This museum is freely opened to the geological student, and is at present deposited in the premises immediately attached to his house in Highbury, Islington. Anxious to extend a knowledge of the fossils of the British islands, he founded the Palæontographical Society, the object of which was to give descriptions and accurate representations of all known British fossils not previously described. This society was started with a series of works unrivalled for the beauty of their illustrations and the exhaustive nature of the letter-press descriptions accompanying them. Mr. Bowerbank was also one of the early founders, and is treasurer, of the Ray Society, and is a Fellow of the Royal Geographical, Linnean, Zoological, Microscopical, Entomological, and Royal Astronomical Societies.

BRANDE, W. T., a distinguished chemist, was born about 1780. Early in life he devoted himself to chemical studies, and in 1813, having previously been for some time the assistant, was appointed successor to Sir Humphry Davy as professor of chemistry to the Royal Institution of Great Britain. He retired from this position in 1852, and holds now the post of honorary professor of chemistry. He was also for many years professor of chemistry and materia medica to the Society of Apothecaries. His earlier publications were devoted to chemical subjects. In 1817 he published an 'Outline of Geology.' A second edition of this work appeared in 1829. In 1819 he published a 'Manual of Chemistry.' This work met with a speedy sale, and new editions have been five times published. In 1841 he also published a work entitled 'Elements of Chemistry.' In 1843 appeared his 'Dictionary of Materia Medica.' He also edited the 'Dictionary of Sciences, Literature, and the Arts,' usually known as Brande's Dictionary. From 1816 to 1850 he delivered every year a course of lectures and demonstrations on chemistry to medical and other students in the laboratory of the Royal Institution. The lectures were published in the 'Lancet' about the year 1830. A course of lectures which was delivered at the Royal Institution on the application of chemistry to the arts was reported and published by Dr. Scoffern in 1854. In addition to these larger works, Mr. Brande has been constantly producing papers, tables, and smaller works on the subject of chemistry, so that his name is indissolubly connected with the progress of chemistry in this country during the first half of the nineteenth century. [See SUPPLEMENT.]

* BRAYLEY, EDWARD WEDLAKE, F.S.A., a laborious an and accurate topographer, was born in London (in the parish of Lambeth, Surrey), in the year 1773. He was apprenticed to one of the most eminent practitioners of the art of enamelling, but having from an early age been strongly addicted to literary pursuits, he gradually abandoned that business as a means of life, and devoted himself, a few years after attaining his majority, to the more congenial occupations of professional literature. His acquaintance with Mr. Britton [BRITTON, JOHN] had commenced before the expiration of his apprenticeship, and he also being desirous of exchanging a servile occupation for the pursuits of literature and the fine arts, the two young aspirants were

Digitized by Google

associated in several literary undertakings of a minor description, until they united in projecting and in producing the well-known work on which their reputation was originally founded—'The Beauties of England and Wales,' the earlier volumes of which were written by them. This work greatly contributed to extend and gratify the zest for topographical history, which in the early part of the 19th century was so remarkably characterised. The illustrations, chiefly copper-plate engravings, directed also by the authors, were the means by which many of the most eminent of our architectural and landscape draughtsmen and engravers became qualified for the execution of works of a higher grade in art. Mr. Brayley himself contributed also to the progress of the fine arts in another direction. Having become acquainted with the late Henry Bone, R.A., when that artist was endeavouring to elevate painting in enamel to the position it subsequently acquired in his hands, as an integral and a legitimate branch of accepted pictorial art, he had early begun to prepare enamelled plates for Mr. Bone's use. This he continued to do for some years after he had become eminent as a topographer, and the plates for the largest paintings in enamel which Mr. Bone executed—the largest ever produced until they were exceeded, in several instances, by those of his late Mr. Charles Muss—were not only made by Mr. Brayley, but the pictures also conducted by him throughout the subsequent processes of 'firing,' or incipient fusion on the plate, in the muffle of an air-furnace, requisite for their completion. His derived practice of enamelling on copper, and the preparation of enamel-colours a certain interest in science and its pursuits, especially those of chemistry, mineralogy, and the allied departments of natural knowledge, which, though it scarcely rose above the character of an intelligent curiosity, was retained by him through life, and contributed to the early taste which he introduced into county history—in 'The Beauties,' and in his subsequent works—the more characteristic or interesting features of the natural history of the localities described. He acquired also, from the same early occupations, a skill in manipulation, which in after-life he applied to good purpose in his archæological researches, in taking casts of sculptured ornaments, impressions of inscriptions, rubbings of engraved monumental brasses, &c. It may here be remarked, with reference to his topographical works generally, that though there were better geographers and historians, better architectural and record antiquaries, better heralds, critics in art, and bibliographers, there were probably few of his contemporaries—certainly none of his earlier ones—who could unite and apply a competent knowledge of the subjects of all these branches of literature and archæology to what is termed Topography, in a manner at once so useful and so acceptable to general readers and the public.

In the year 1825 Mr. Brayley was appointed librarian and secretary of the Russell Institution, Great Coram-street, the third in date and in rank of the literary and scientific institutions established in London, which had been founded about seven years before to meet the intellectual requirements of the populous superior middle-class suburb which was then growing up on the estates of the Duke of Bedford and the Foundling Hospital, on the north side of the metropolis. He was the third librarian in succession of Russell Institution, the first having been the late Nathaniel Highmore, LL.D. and M.D. of Jesus College, Cambridge (author of 'Jus Ecclesiasticum Anglicanum,' &c.). In this capacity Mr. Brayley greatly improved the library and conducted with ability the general business of the institution, continuing however to follow the pursuits of a topographer and antiquary. He produced several catalogues of the library (the last in 1849), which are not however remarkable in a bibliographical point of view, except perhaps for the extent to which the principle of the analysis of collections is carried. Having a singular strength of constitution, neither the wear and tear of those united official and professional vocations, nor the progress of age, sensibly impaired his faculties, either physical or mental, for many years. His most extensive, and, with the exception of 'The History of Westminster Abbey,' perhaps his best work, was also his last, 'The Topographical History of the County of Surrey,' which he composed and produced between the ages of sixty-eight and seventy-six, during which period the history of the places and objects described was diligently and critically investigated in the localities themselves in very many journeys into the county. For a year or two prior to his decease, gradually increasing though slight weakness and liability to disease was observed in him by the members of his family, but his intellectual powers remained unimpaired until the period of his death, which was occasioned by the consecutive fever of cholera, on the 23rd of September 1854, in the eighty-second year of his age; he having filled his official position for nearly twenty-nine years, and been actively engaged in the pursuits of historical and descriptive literature for about fifty-six years. Mr. Brayley became a Fellow of the Society of Antiquaries on the 19th of June 1823. His wife had predeceased him a few years; their surviving children are the eldest son and daughter. Of the former some account is given below.

The following is a list of Mr. Brayley's principal works and contributions to literature:—

'A Picturesque Tour through the Principal Parts of Yorkshire and Derbyshire, by the late Mr. Edward Dayes; with Illustrative Notes by E. W. Brayley,' 1805: second edition, with additional notes, 1825. 'Views illustrative of the Works of Robert Bloomfield, accompanied with Descriptions; to which is added a Memoir of the Poet's Life,' 1806. 'Cowper: illustrated by a Series of Views; accompanied with Copious Descriptions, and a Brief Sketch of the Poet's Life,' 1810. 'Descriptions of Places represented in Middiman's Views and Antiquities of Great Britain,' 4to, 1813. 'Popular Pastimes: a selection of Picturesque Representations, accompanied with Historical Descriptions,' 1816. 'Delineations, Historical and Topographical, of the Isle of Thanet and the Cinque Ports,' 1817. 'History and Antiquities of the Abbey Church of St. Peter, Westminster; including Notices and Biographical Memoirs of the Abbots and Deans of that Foundation,' 1818-23. 'The Ambulator, or Pocket Companion for the Tour of London and its Environs: twelfth edition, with an Appendix containing Lists of Pictures in all the Royal Palaces and principal Mansions round London,' 1819. 'A Series of Views in Islington and Pentonville, by A. Pugin; with a Description of each subject, by E. W. Brayley,' 1819. 'Topographical Sketches of Brighthelmstone and its Neighbourhood,' 1825. 'An Enquiry into the Genuineness of Prynne's Defence of Stage Plays, &c., together with a reprint of the said Tract, and also of Prynne's Vindication,' 8vo, 1825. 'The History and Antiquities of the Cathedral Church of Exeter,' 1826-27 (in Britton's 'Cathedral Antiquities'). 'Historical and Descriptive Accounts of the Theatres of London,' 1827. 'Londiniana; or Reminiscences of the British Metropolis,' 1829, 4 vols. 'Devonshire Illustrated, in a Series of Views of Towns, Docks, Churches, Antiquities, Abbeys, Seats, Picturesque Scenery, Coasts, Seats of the Nobility, &c.,' 1829. 'The Antiquities of the Priory of Christ's Church, Hants; accompanied by Historical and Descriptive Accounts of the Priory Church; together with some General Particulars of the Castle and Borough,' 1834. 'The Graphic and Historical Illustrator: an Original Miscellany of Literary, Antiquarian, and Topographical Information,' 1834. 'A Journal of the Plague Year; by Daniel De Foe: a new edition, attentively revised and illustrated with Historical Notes,' 1835. 'Illustrations of Her Majesty's Palace at Brighton, formerly the Pavilion; executed under the Superintendence of John Nash, Architect to His Majesty,' 1838. 'History of the Palace and Park of Windsor,' 1841. 'The Topographical History of Surrey,' 5 vols., 1841-48: the names of Mr. Britton and Mr. Brayley, jun., are inserted in the title-pages, but neither took any part in the work. The article 'Topographical,' in Rees's Cyclopædia, vol. xxiii., published before 1811.

'The Antiquarian and Topographical Cabinet,' a very popular and successful work, published by the well-known engravers Messrs. Storer and Greig, was designed by Mr. Brayley, and the first number or two written by him, and produced under his direction.

In conjunction with J. Britton,—'The Beauties of England and Wales; or Original Delineations, Topographical, Historical, and descriptive, of each County,' 1810-14. 'The British Atlas; comprising a series of Maps of all the English and Welsh Counties; also Plans of Cities and Principal Towns,' 1810. 'Memoirs of the Tower of London,' 1830. 'The History of the Ancient Palace and late Houses of Parliament at Westminster,' 1836.

In conjunction with William Herbert:—'A Concise Account, Historical and Descriptive, of Lambeth Palace,' 1806.

EDWARD BRAYLEY, EDWARD WILLIAM, F.R.S., known for some years as E. W. Brayley, jun., is joint librarian of the London Institution, Finsbury Circus. On the abolition, some years since, of the office of principal librarian, which had been held in succession by Professor Porson [PORSON, RICHARD] and the late eminent scholar William Maltby, Mr. Brayley, jun., and Mr. Richard Thomson, the author of 'An Historical Essay on Magna Charta,' 'Chronicles of London Bridge,' 'Tales of an Antiquary,' &c.), were appointed librarians of equal rank and duties, though taking special charge respectively, from the different nature of their pursuits, of different portions of the collection—Mr. Brayley directing his particular attention to the scientific classes of books. He was a pupil both of the London and of the Royal Institution (in chemistry, of Professor Brande), but had given some attention to topographical literature, which however at an early age he relinquished for the pursuits of scientific literature and of science itself, including both the public and private teaching of several branches of natural knowledge. From 1822 to 1845 he was, either in succession or at the same time, one of the editors of the 'Annals of Philosophy,' the 'Zoological Journal,' and the 'Philosophical Magazine.' To all these, in addition to reviews and other editorial articles and notes, he contributed original papers and notices, chiefly on subjects of mineralogical chemistry, geology, and zoology, together with special communications on Igneous Meteors and Meteorites, and a few articles of scientific biography. In 1829 and 1830 he was engaged by Mr. Rowland Hill (now Secretary to the Post-Office) [HILL, ROWLAND], and the father and brothers of that gentleman, to take charge, as lecturer and tutor, of a department of instruction in physical science which they were desirous of making a permanent part of the system of education carried on in their schools of Hazelwood, near Birmingham, and Bruce Castle, Tottenham, near London. But the scheme was not adequately encouraged by the public, who have even yet scarcely recognised the importance of such instruction being made a part of elementary education. The original views on this subject of the Messrs. Hill and of Mr. Brayley were explained and advocated by him in a work, published in 1831, entitled 'The Utility of the Knowledge of Nature considered, with reference to the General Education of Youth.'

Digitized by Google

At the London Institution Mr. Brayley has taken a part in the system of lectures, both illustrative and educational, and in the expositions of the progress of science occasionally given at the soirées. His cycle of educational lectures consists of physical geography and the allied branches of terrestrial physics—geology and palæontology—mineralogy and crystallography—and meteorology, with the branches of terrestrial physics more particularly allied to that science. He has occasionally delivered discourses on special subjects at the Friday evening meetings of the Royal Institution: one, May 11, 1838 ('Phil. Mag.,' S. 3, vol. xii., p. 533), 'On the Theory of Volcanos,' he showed that the thermotic theory of plutonic and volcanic action, indicated by Mr. George Poulett Scrope, M.P., F.R.S., and explicitly proposed and developed by Mr. Babbage and Sir John F. W. Herschel, must necessarily be grounded, as an integrant part, contrary to an opinion of the latter, the chemical theory on the same subject of Sir H. Davy, founded on his discovery of the metallic bases of the alkalies and alkaline earths. This subject was resumed in a course of lectures on Igneous Geology, also delivered at the Royal Institution, in 1845, as modified by the subsequent researches of Mr. William Hopkins, F.R.S., of St. Peter's College, Cambridge, on the state of the interior of the earth and the effective thickness of its crust.

He was the editor of the last genuine edition of Parkes's 'Chemical Catechism' (1834), which, though now comparatively antiquated, is still referred to with advantage, even by proficients in chemistry. In another description of editing, Mr. Brayley has given assistance to several men of science, in conducting their works through the press, and assisting them to give the expression to their own views, confided to him. Among these works may be particularised the 'Orizioes Biblicæ' of Dr. Charles Burke, F.S.A.; the 'Correlation of Physical Forces' of Mr. Grove, F.R.S. (the first and second editions) [GROVE, WILLIAM ROBERT]; and the 'Barometrographia' and 'Appendix' of Mr. Luke Howard, F.R.S., the author of his 'Nomenclature of the Clouds' universally employed, and of 'The Climate of London.'

Mr. Brayley was elected a Fellow of the Royal Society on the 1st of June 1854; he is also a member of other scientific bodies in England, metropolitan and provincial; a corresponding member of the Society Naturæ Scrutatorum of Basel; and a member of the American Philosophical Society.

*BROOKS, CHARLES SHIRLEY, born in 1815, is the son of an architect of eminence who built the London Institution and other public edifices. He was educated at Islington by the Rev. J. T. Bennett; was articled to a solicitor at Oswestry; and subsequently acquired a more extended legal experience with a London solicitor. Although passed with credit, and qualified to practise on his own account, the profession was not to his taste; and he was gradually led forward by the encouragement of a favourable reception of contributions to periodical works, to determine upon literature as the business of life. He wrote some dramatic pieces which were successfully performed at the Haymarket Theatre, and the Hanpic theatre-; and in time he came to occupy a responsible position as a journalist. For five sessions he wrote for the 'Morning Chronicle' that portion of its columns which required the most careful attention and the most judicious treatment—the summary of the debates. His close habits of observation, and his lively treatment of subjects which in unskilful hands would have become unattractive, recommended him to an engagement upon the same paper, to investigate the condition of the cultivators in the south of Russia, Asia Minor, and Egypt. The results of a six months' tour were published in letters in the 'Chronicle,' and the Russian portion has been reprinted in Longman's Traveller's Library.' During sixteen years Mr. Brooks has been one of the regular writers of 'Punch.' The constant labour of periodical literature has not however diverted him from more ambitious efforts. He is the author of a novel deservedly popular, 'Aspen Court.' This production is evidently the work of a man of original thought and large experience. The life of a London solicitor's office is presented vividly, and, we should imagine, very truly. The close, sagacious, but not unamiable head of the firm; the idle and thoughtless articled clerk who retains his position through his valuable family connection, are striking features of a class. The interest, though occasionally of an ultra-romantic kind, is well sustained, and the characters boldly drawn. There is much playful satire of prevailing follies, and a general tone of manly contempt for meanness and profligacy. His later novels, 'The Gordian Knot,' 'The Silver Cord,' 'Sooner or Later,' have secured him a foremost place among living writers of fiction.

BRYDGES, SIR SAMUEL EGERTON, Bart., was born November 30, 1762, at Wootton Court, Kent. His father was Edward Brydges, Esq. of that place; his mother was the daughter and co-heiress of the Rev. W. Egerton, LL.D., Prebendary of Canterbury, &c. Young Brydges was educated first at Maidstone Grammar School, and afterwards at the King's School, Canterbury, whence he proceeded to Cambridge, entering at Queen's College in October 1780. He left the university without taking a degree; entered himself of the Middle Temple in 1782, and in 1787 was called to the bar. He never practised however, but, having married in 1786, devoted himself to literature, and especially to genealogical and bibliographical studies. His earliest appearance in print was as a poet, a volume of 'Sonnets and other Poems' being published by him in 1785. Soon after the death of the last Duke of Chandos, in 1790, his uncontrolled imagination, exalted perhaps by his somewhat superficial genealogical loquiries, a large share of vanity, and a passion for titles, led him to stimulate his elder brother the Rev. E. T. Brydges to prefer a claim to the barony of Chandos, alleging his descent from the first Brydges or Bridges, who bore that title. Litigation was protracted till June 1803 when the House of Lords decided that the petitioner had not made out his right to the title. Henceforth every thing which Sir Egerton Brydges wrote, was more or less a wail for the lost dignity, and after the death of his brother, he always wrote himself 'per legem Terræ Baron Chandos.' The worthlessness of his claim is amply shown in a 'Review of the Chandos Peerage Case, adjudicated 1803, and of the pretension of Sir S. E. Brydges, Bart., to assume himself Per legem Terræ, Baron Chandos of Sudeley. By George F. Beltz, Esq., Lancaster Herald,' 8vo, 1834. By improvident expenditure in the purchase and improvement of the estate of Denton, Kent, Mr. Brydges had early become involved in his pecuniary circumstances, and in 1810 he removed to Lea Priory, the seat of his son, where he amused himself by setting up a private press, and superintending the printing of various pieces in prose and verse of his own writing, and reprints of scarce old books. After several unsuccessful efforts to get into parliament he was elected in 1811 for Maidstone, which place he represented till 1818. In 1814 he obtained a patent of baronetcy. On losing his seat in parliament he retired to the Continent, where he remained till his death, which occurred at Compagne Gros Jean, near Geneva, September 8, 1837.

Besides the works above enumerated, and several pamphlets on population, wealth, &c., Sir Egerton Brydges wrote 'The Topographer,' 4 vols. 1789-90 (in which he was assisted by the Rev. Stebbing Shaw); the novels of 'Mary de Clifford,' (1792); 'Fitz Albini,' a kind of fictious autobiography (1798); 'Le Forester' (1802); 'Conjugality' (1819); and 'The Hall of Hollingey' (1821); 'The Censuria Literaria,' a bibliographical work of some value, 10 vols. 8vo, 1805-1809; 'The British Bibliographer,' written in conjunction with Joseph Haslewood, 4 vols. 1810-12; 'Restitua, or Titles, Extracts, and Characters in Old English Authors,' 4 vols. 1814-21; a new edition of 'Collins's Peerage,' 9 vols. 1812; 'The Ruminator,' and 'The Wanderer,' two series of essays, 1813, 1814; 'Occasional Poems,' 1814; 'Bertrand, a Poem,' 1815; 'Excerpta Tudoriana, or extracts from Elizabethan Literature,' 2 vols. 1819; 'Res Literariæ,' 3 vols. 1820-21; 'Letters from the Continent,' 1821; 'Letters on Lord Byron,' 1822; 'Quondam, or Detached Thoughts;' 'Odo, Count of Lingen, a Poem;' 'Theatrum Poetarum,' 1824; 'Recollections of Foreign Travel,' 1825; 'The Lake of Geneva,' 2 vols. 1832; 'Imaginary Biography,' 2 vols.; and two Autobiography, Times, Opinions, and Contemporaries of Sir Egerton Brydges, K.T. (per legem Terræ) Baron Chandos of Sudeley, &c., 2 vols. 8vo, 1834.

*BUSK, GEORGE, a distinguished living surgeon and naturalist, was born in Russia, with which country his family has extensive commercial relations. At an early age he came to England, and was educated for the medical profession. On passing the College of Surgeons he was appointed house-surgeon on board the Dreadnought Hospital ship in the Thames. He lived on board this ship for many years, and in superintending the large number of cases brought before him in this hospital he acquired the great surgical knowledge and experience for which he is distinguished. On leaving the ship as house-surgeon Mr. Busk was appointed surgeon, a position he still holds. In his profession Mr. Busk has the reputation of a sound observer, and a skilful operator. He has published many papers on surgical subjects in the Transactions of the Medico-Chirurgical Society, and other places. He has most successfully employed the microscope in the investigation of pathological subjects. As illustrations of this his papers on the Guinea Worm and Hydatids in the Transactions of the Microscopical Society may be referred to. He was one of the early members of the Microscopical Society and was chosen president of that body during the years 1848 and 1849.

Mr. Busk has devoted his leisure hours to the study of natural history, and has made some most important contributions to various departments of Zoology. One of the most complete and valuable of his works is the Catalogue of the Marine Polyzoa contained in the collections of the British Museum. This catalogue, which has already extended to two volumes, contains figured illustrations of a large number of new genera and species of this highly interesting family of Mollusceus animals. The drawings have been executed on stone by Mr. Busk himself. He has also published several papers on the structure of the Jelly fishes and other forms of the lower animals in the Transactions of the Microscopical Society, and in the Quarterly Journal of Microscopical Science, of which he is one of the editors. In conjunction with Mr. Huxley he translated Professor Kölliker's work on Histology from the German for the Sydenham Society. He also translated for the same society Wedl's Pathological Histology.

On the appointment of Professor Quekett to the superintendent of the natural history collections of the British Museum, Mr. Busk was appointed Hunterian professor of Comparative Anatomy at the Royal College of Surgeons of England. He is a Fellow and a member of the Council of the Royal Society, assistant Secretary of the Linnean Society, and one of the Court of Examiners of candidates for the medical service of the East India Company.

CANNING, CHARLES JOHN, FIRST VISCOUNT, second son of the Rt. Hon. George Canning, was born at Brompton in 1812, and was educated at Christchurch College, Oxford, where he graduated first class in classics, and second class in mathematics in 1833. In 1835 he married the eldest daughter of the first Lord Stuart de Rothsay. In 1836 he entered the House of Commons as member for Warwickshire. On the death of his mother in 1837 he succeeded to the title, and took his seat in the House of Peers. In 1841 he became Under Secretary of State for Foreign Affairs under the Earl of Aberdeen in Sir Robert Peel's ministry, in which office he continued till 1846; he was afterwards a Commissioner of Woods and Forests; in the last of Aberdeen's ministry he was Post-master-General; and in 1855 he was nominated by Lord Palmerston's government to the governor-generalship of India. This office he assumed at Calcutta on February 29, 1856. Early in 1857 the disastrous mutiny in the Bengal army broke out. The great outburst of disaffection was on the 10th of May at Meerut, from which place the mutineers marched upon Delhi, where they arrived on the 11th, and being joined by several native regiments, they took possession of the place, committing unheard-of atrocities. Mutiny, disaster, massacre, and a perfect reign of terror followed. Calcutta itself was threatened. Soldiers were demanded from England; from 30,000 to 40,000 men were forwarded; and Sir Colin Campbell, at a day's notice, undertook the responsible office of commander-in-chief. The British forces already in India took up a position near Delhi on the 20th of May under General Anson, who died of cholera on the 27th. He was succeeded on the 8th of June by Sir H. Barnard, who likewise died of cholera on the 5th of July, and was succeeded by General Reid. This general had to resign on account of ill-health, and was succeeded by General Wilson, who, having received reinforcements under General Nicholson, commenced the assault on Delhi on September 14th, and after frightful slaughter gained possession of the place on Sept. 20th. Lucknow, in which a small body of soldiers and civilians had been cooped up for months, was partially relieved by General Havelock, after a succession of victories over the mutineers, on the 25th of September. Colonel Greathed, pursuing the mutineers after the capture of Delhi, obtained several successes over them. As governor-general, Viscount Canning's measures have produced considerable discussion, especially the order for the restriction of the newspaper press, the Oude land-law, and that for the giving up or registry of arms. [*See* SUPPLEMENT.]

CAREY, WILLIAM, D.D., principal founder of the Serampore Mission, was the son of the master of a small free-school at the village of Paulerspury, in Northamptonshire, where he was born on the 17th of August 1761. He was apprenticed to a shoemaker at Hackleton, but becoming early the subject of deep religious impressions, he began to preach about the age of twenty, and, without entirely giving up his business, settled at Moulton, in his native county, as pastor of a small Baptist church, whence, in 1789, he removed to Leicester. It was during his residence at Moulton that Carey wrote 'An Enquiry into the obligation of Christians to use means for the Conversion of the Heathen,' a work which led, in an important degree, to the formation of the Baptist Missionary Society; but it was not published till some years after it was written, it being found difficult to excite even ministers to any feeling of interest in the subject of foreign missions. The society having been organised, Carey and a Mr. Thomas, who for nearly ten years had been exerting himself in India to promote Christianity, were chosen as the first Missionaries. It deserves to be mentioned as an indication of the difficulties to be overcome by the society's first agents, especially in consequence of the opposition of the English East India Company to any efforts for the evangelisation of Hindustan, that Carey and his companion Mr. Thomas, before they could ship in which they set sail finally left the coast of England, set ashore in consequence of threats held out in an anonymous letter which followed the captain; and were thus compelled to take passage in a Danish ship, which was not under the Company's control. For some months after their arrival at Calcutta the missionaries endured great trials, and they were at length compelled to accept engagements to superintend indigo factories in the vicinity of Malda, sparing what time and money they could for the promotion of their primary object. In 1793 Carey began the work of Bible translation; and in 1799, in which year he removed to Kidderpore, he bought a press and printing apparatus. A third missionary had been sent out in 1796 to join Carey and his fellow-labourer; and in 1799 four others, with their wives, including Mr. (afterwards Dr.) Marshman, and Mr. Ward, who had been brought up to the printing business, and to whom Carey had, before leaving England, expressed a hope that he might join the mission, in anticipation of the necessity which might arise for his practical knowledge of the art, were sent out. As the East India Company would not allow them to settle as missionaries in their dominions, the mission establishment was, about the time of their arrival, removed from Kidderpore to the Danish settlement of Serampore, where for many years the work of translating and printing the Scriptures and other books in the various languages of Hindustan was carried on with surprising energy. It appears from the appendix to a 'Tenth Memoir respecting the Translation of the Sacred Scriptures into the Oriental Languages, by the Serampore Brethren,' which was published in London in 1834, that the translation and printing of the New Testament into Bengali was completed in 1801; and that between that date and the month of July 1832, the whole of the Bible was rendered into this language, and either the whole or part into at least thirty-nine other Oriental languages or dialects, 212,565 copies of the New Testament and other portions of the Bible having been issued during that time from the Mission press, in addition to many printed for the British and Foreign Bible and some other Bible societies. During the same period a great number of religious tracts and miscellaneous works were also produced in several different languages, including a Bengali map of India, a grammar, two dictionaries, a semi-monthly newspaper, and a 'Youth's Magazine,' in Bengali and English; and, in Bengali alone, several large volumes of Government Regulations, a History of India, a translation of Goldsmith's History of England, a Treatise on Anatomy, intended as the first volume of an Encyclopædia of the Sciences, a Treatise on Geography, and a translation of the Pilgrim's Progress. The list of works in Sanscrit, Chinese, and other languages comprises also many important books.

In these great undertakings Dr. Carey was the chief director, while a very large proportion of the actual literary labour also rested upon him, in addition to which he performed the duties of professor of Oriental languages in the college of Fort William, at Calcutta, from its establishment in 1800 until its virtual abolition by the discontinuance of English professors about the year 1830, when he received a pension from government. He died at Serampore on the 9th of June 1834, in his seventy-third year, leaving some autobiographical memoranda which have been used by his nephew, the Rev. Eustace Carey, in his 'Memoir' of him published in London in 1836, to which a portrait is prefixed. In a biographical sketch by his son Jonathan, incorporated in the memoir referred to, it is observed that in all his undertakings connected with the general good of his adopted country, Dr. Carey took an active part, and that "he prepared, under the direction of a noble lady then resident in India, the prospectus of an agricultural society in the East, to which was united an horticultural society, of which he was a member, and in the affairs of which he took a lively interest, till his last illness; and he had the gratification to see that the society became at length the most flourishing and interesting society in the East, in which gentlemen of the first respectability, from all parts of the country, united, and which still continues an enterprising and useful and flourishing institution." Botany was, indeed, a very favourite study with Dr. Carey, whose share in the publication of Roxburgh's 'Flora Indica' is noticed under ROXBURGH, WILLIAM, M.D., vol. v., col. 132. "In the Asiatic Society," continues his son, "he also took an active part; and for many years, up to his death, the Society was indebted to the members of his circle of papers, and afforded considerable information, and in various ways promoted the general interests of the institution." "At his death," he adds, "the Bishop of Calcutta, in a speech, passed the highest encomiums on the character and talents of Dr. Carey; and a minute was recorded expressive of the loss sustained by the society, and their regret at the removal of one of its most excellent members."

From 'Remarks on the Character and Labours of Dr. Carey, as an Oriental Scholar and Translator,' by H. H. Wilson, Esq., Boden Professor of Sanscrit in the University of Oxford, which is also appended to the 'Memoir' by Eustace Carey, we select the following sketch of his more important and legitimate labours. "At the time," observes Mr. Wilson, "when Dr. Carey commenced his career of Oriental study, the facilities that have since accumulated were wholly wanting, and the student was destitute of all elementary aid. With the exception of those languages which are regarded by the natives of India as sacred and classical, such as the Arabic and Sanscrit, few of the Indian dialects have ever been reduced to their elements by original writers. The principles of their construction are only observed by practical use, and a grammar or vocabulary forms no part of such scanty literature as they may happen to possess; accustomed from infancy to the familiar use of their vernacular inflexions and idioms, the natives of India never thought it necessary to lay down rules for their application; and even in the present day they cannot, without difficulty, be prevailed upon to study systematically the dialects which they daily and hourly speak. Europeans however are differently circumstanced. With them the precept must precede the practice, if they wish to attain a critical knowledge of a foreign tongue. But when the Oriental languages first became the subjects of investigation, those precepts were yet to be developed, and the early students had therefore as they gathered words and phrases, to investigate the principles upon which they were constructed, and to frame, as they proceeded, a grammar for themselves." "The talents of Dr. Carey were," he adds, "eminently adapted to such an undertaking." Mr. Wilson goes on to state that Dr. Carey's Sanscrit Grammar was the first complete one published, his Telinga grammar the first printed in English, his Karnate and Mahratta grammars the first published works developing the structure of those languages, his Mahratta dictionary one of the first attempted, and his Punjabi grammar the only authority for the language of the Sikh nation; "and although," he remarks, "he must concede to Halhed the credit of first reducing to rule the construction of the Bengali tongue, yet by his own grammar and dictionary, and other useful rudimental publications, Dr. Carey may claim the merit of having raised it from the condition of a rude and unsettled dialect to the character of a regular and permanent form of speech.

Digitized by Google

possessing something of a literature, and capable, through its intimate relation to the Sanscrit, of becoming a refined and comprehensive vehicle for the diffusion of sound knowledge and religious truth." Some of the works here referred to were of great extent; the Sanscrit grammar, for example, comprising upwards of 1000 quarto pages, and the Bengali and English Dictionary, published in 1815 and 1825, in three volumes, upwards of 2000 quarto pages, and about 80,000 words. An abridgment of the latter work, prepared by Dr. Marshman under the supervision of Dr. Carey himself, was published in 1827 in one thick octavo volume. One of the extensive literary productions of the Serampore press was 'The Rámáyana of Valmeeki, in the original Sanscrit, with a Prose Translation, and Explanatory Notes,' edited by Drs. Carey and Marshman, of which four quarto volumes were published, in 1806 and subsequent years, under the sanction of the Asiatic Society and the Council of Fort William College, but which, unfortunately, was never completed.

It may, at first sight, excite some surprise that the Serampore missionaries should, in some instances, have issued translations in languages or dialects with which none of them were fully acquainted. "In this department," observes Mr. Wilson in explanation, "Dr. Carey took a leading part, and it was in connexion especially with his duty of revising the different translations that he added to his great proficiency in Sanscrit and Bengali, a knowledge of those dialects whose elements he first investigated." "Possessed in this way," he states, "of at least six different dialects, and of Sanscrit, the parent of the whole family, and endowed with a genius for philological investigation, Dr. Carey was peculiarly qualified to superintend the translation of the Scriptures into a number of cognate languages, and it may be granted that, in combination with his colleagues, he carried the project to as successful an issue as could be expected from the bounded faculties of man."

CATHCART, LIEUTENANT-GENERAL THE HON. SIR GEORGE, K.C.B., was born in London on the 12th of May 1784, the third son of William Shaw, the first Earl Cathcart. He was educated at Eton, and at the University of Edinburgh; and in 1810 he began his military life by joining the 2nd Life Guards. In 1812, by which time he had been promoted to a lieutenancy, he accompanied as aide-de-camp his father, who was sent as plenipotentiary to Russia. When they arrived the French were in possession of Moscow, and when the Emperor Alexander took the field in person in 1813, Lieutenant Cathcart joined the imperial army. He was with the grand army throughout the campaigns of 1813 and 1814, witnessed the battles of Lutzen and Bautzen, those of Dresden and Leipzig, of Brienne, Bar-sur-Aube, Arcis-sur-Aube, and the taking of Paris. Of these campaigns, and more particularly of the strategy of Napoleon I. as displayed in the latter, he published a volume of Commentaries in 1850, from which the facts noted at the time, accompanied with diagrams showing the position of the armies, with their movements. It is a valuable work; additional interest being given to it by an introduction explaining the different military systems of the Allied Powers, as well as of the French, and displaying the effects of national characteristics in the different circumstances of attack and defence. In 1814 he again accompanied his father, who was one of the three plenipotentiaries sent to Vienna. On the return of Napoleon from Elba he was appointed aide-de-camp to the Duke of Wellington, and was present at Quatre Bras and Waterloo. He was continued in the appointment when the Duke became master-general of the Ordnance, and accompanied him on his mission to Aix-la-Chapelle, Verona, and Berlin. In 1828 he had arrived at the rank of Lieutenant-Colonel, and served for about eight years in Nova Scotia, Bermuda, and Jamaica, after which he retired on half-pay; but in 1837 was recalled into active service on account of the outbreak in Canada, where he proved himself an active and efficient officer. After serving there for more than six years he returned home, and again retired on half-pay in 1844. In 1846 he was made Deputy-Lieutenant of the Tower, an office which he held till 1852, when he accepted the governorship of the Cape of Good Hope, with the command of the forces, and brought the Kaffir insurrection to a successful termination. On his return to England he was immediately sent as General of Division to the Crimea, where much was expected from a man so thoroughly acquainted with the practice and science of his profession. He however had short time to display his capabilities. In the battle of Inkermann, on the 5th of November 1854, where he displayed the most heroic bravery, but in which the attack he made on the left was met by a force so superior that it failed in the desired effect, he fell, together with the other leading chiefs. He was buried on the spot—Cathcart's Hill—with eleven other officers who had fallen.

CERVANTES. [SALAVERDIA, vol. v., col. 223.]

CHASLES, VICTOR-EUPHEMION-PHILARÈTE, has an especial claim to a place in an English Cyclopædia of Biography, as the French writer who has done most to familiarise his countrymen with the spirit and purpose of our current English literature. He was born at Mainvilliers, near Chartres, on the 8th of October 1797, received the usual school education, and at the age of fifteen was placed in a printing-office in Paris. Becoming implicated with his master in some of the many political disturbances of 1815, he was arrested, but, after an imprisonment of about two months, was set at liberty by the intervention of Chateaubriand. He now came to London to complete his apprenticeship, and entered the office of Mr. Valpy, who employed him on his editions of the classics. During the seven years he remained in London he made himself colloquially familiar with the English language, and obtained a considerable acquaintance with English literature. On leaving England he proceeded to Germany and the north of Europe. Returning to France, he became secretary to M. Jouy, and has since devoted himself with unflagging industry to literature. For the most part, his writings have in the first instance appeared in periodical works; but many of his essays have been revised or recast, and published in a separate form. His contributions have chiefly, though far from exclusively, related to English and German literature, on which he has come to be regarded as a leading authority by his countrymen; and his eminence in this department has led to his appointment to the professorship of English in the Collège de France, and an assistant librarian in the Mazarine Library. M. Philarète Chasles is a clear, vigorous, and lively writer, a shrewd observer of our manners, and a fair as well as a clever critic of our literature. His minutely accurate acquaintance with our language is very remarkable for a French littérateur. Not only is he well versed in its mutations, but he writes it with ease and correctness, and catches readily our current vernacular, down to its latest and most fugitive additions. His principal essays have appeared in the 'Revue des Deux Mondes,' and in the 'Journal des Debats,' but he has been the chief contributor of 'redactions' of leading English review articles to the 'Revue Britannique,' and he has furnished many introductions to translations of English and German authors, as well as translating some himself. It ought also to be noticed that he has occasionally contributed admirable articles on the English language to English journals; and he has carried on an extensive literary correspondence with literary men in England, America, Germany, and the northern countries. His chief separate work (as already noticed, a recasting of essays contributed to periodical publications) is his 'Études de littérature comparée,' in 12 vols., comprising—'Études sur l'Antiquité,' 1 vol.; 'sur le moyen âge,' 1 vol.; 'sur le XVIe siècle en France,' 1 vol.; 'sur l'Espagne,' 1 vol.; 'sur la révolution d'Angleterre au XVIIe siècle. Cromwell, sa vie privée,' &c., 1 vol.: 'sur le XVIIIe siècle en Angleterre,' 2 vols.; 'sur la littérature et les mœurs de l'Angleterre au XIXe siècle,' 1 vol.; 'sur la littérature et les mœurs des Anglo-Americains au XIXe siècle,' 1 vol.; 'sur les hommes et les mœurs au XIXe siècle,' 1 vol.; 'sur Shakspeare, Marie Stuart, et l'Arétin,' 1 vol.; 'sur l'Angleterre au XIXe siècle,' 1 vol. He has also written 'Voyages et Voyageurs,' 'Charles I., sa cour, son peuple, et son parlement;' and 'Tableau de la littérature au XVIe siècle.' (*Nouv. Biog. Générale; Études, &c.*)

COOKE, W. F. [WHEATSTONE, PROF., Suppl.]

COOKE, MICHAEL, an eminent Italian musician, was born at Naples about the year 1810, and educated at the great Conservatorio of that city, receiving instruction from its celebrated director, Zingarelli. He came to England about 1830, and first became known to the public in the capacity of director of the music at the Italian Opera, then the King's Theatre, under the management of M. Laporte. He held that office till the foundation of the Royal Italian Opera at Covent Garden Theatre in 1847, when he was appointed to a similar situation in that establishment, which he still holds. In 1845 he was chosen conductor of the orchestra of the Philharmonic Society; and about the same time the Sacred Harmonic Society placed him at the head of their immense choral and instrumental band in Exeter Hall. His skill and energy have greatly contributed to the prosperity of the Sacred Harmonic Society; and the oratorios performed at Exeter Hall under his direction are models for magnificent and grandeur, to be unrivalled in the world. Since 1849 he has conducted the performance of the Birmingham Festival, the greatest provincial music-meeting in the kingdom. Costa's arduous professional labours have interfered with his pursuits as a composer. He has however composed various works of genius, and his latest and chief composition, the oratorio of 'Elijah,' first performed at the Birmingham Festival of 1855, and 'Naaman,' produced at Birmingham in 1864, have achieved a success only surpassed among recent oratorios by those of Spohr and Mendelssohn.

CRAWFORD, THOMAS, an eminent American sculptor, was born at New York on the 22nd of March 1813. At school he obtained some acquaintance with Greek and Latin literature, but, as is frequently the case with youths in his country, he seems to have been allowed in early life to follow very much his own course. Like Chantrey his earliest instructor in the use of the chisel was a carver in wood. Whilst with him however his strong desire for higher training began to develope itself. He formed a collection of casts of ancient and modern works of a high class, and he learnt to model in clay. At length he was placed as a pupil under Messrs. Frazee and Leuglis, and entered as a student the Academy of Design in New York. Mr. Launitz urged him to proceed to Rome, and gave him a letter of introduction to Thorwaldsen. Accordingly he proceeded to Italy in 1834, and was received into the studio of Thorwaldsen, to whose friendship he was greatly indebted. Thrown by the death of his father on his own resources, he for some time supported himself by making busts. The first poetic work of his which attracted particular attention, was the statue of Orpheus, designed in 1839, but which he was compelled to leave unfinished by an attack of brain-fever, the precursor of his premature fate. On his recovery he completed the Orpheus in marble, a commission

Digitized by Google

having during his illness arrived for it from the Boston Athenæum. It excited general admiration and anticipation. He worked on diligently, gaining in executive skill and confidence, and rising steadily in reputation. Among the chief of his earlier works are his 'Hercules and Hydra' at the head of John the Baptist;' 'The Babes in the Wood;' 'Flora;' and 'The Dancers'—two life-size statues of children, which have had considerable popularity. Among the best of his later works are his bronze statue of Beethoven, now in the Athenæum at Boston, America; the equestrian statue of Washington, which stands in the square at Richmond, Virginia; and the more ambitious alto-rilievo of the 'Progress of Civilisation in America,' which he was commissioned by the federal government to execute for the pediment of the Capitol at Washington. Others of his works are his statues of 'The Genius of Mirth;' 'A Bacchante;' 'David;' and 'Psyche;' his groups of 'Adam and Eve,' of heroic size; 'A Family suffering under the plague of Fiery Serpents;' 'A Mother attempting to save herself and Child from the Deluge;' and his ideal busts of Sappho, Vesta, &c. He also made numerous designs for basi-relievi illustrative of the Old and New Testaments; the poets of Greece, Italy, and England; events of American history, &c., as well as several models of leading American statesmen.

From first entering Rome, Crawford made that city his home. He had just completed a new and spacious studio in order to work with more convenience at the numerous commissions which awaited completion when he was stricken with a disease—tumour on the brain—which rendered him unable again to take up his chisel. He came to London for the benefit of medical advice, but failed to obtain relief, and died in London on the 8th of October 1857. Crawford was a sculptor of a very high order of merit, not reaching to the first rank, but coming close to it. His works display originality and vigour rather than refinement; mental power rather than technical skill. Casts of some of his statues are in the Crystal Palace at Sydenham.

CROSSE, ANDREW, a celebrated experimenter on electricity, was born at Fyne Court, in the parish of Bromfield, on the Quantock Hills in Somersetshire, on June 17, 1784. His father was the proprietor of the estate, to which he succeeded in 1800. He was educated at the school of the Rev. M. Sayers, at Bristol, where he had for school fellows, W. J. Broderip, the Rev. John Eagles, and other equally celebrated men. In 1802 he matriculated at Brasenose College, Oxford, where he was very uncomfortable, the habits, especially that of drinking, being particularly unsuited to him. He returned home in June 1805, on account of the illness of his father, who shortly afterwards died. Even when at school he had become greatly attached to the study of electricity, and on settling on his paternal estate he devoted still more of his attention to the subject. He provided himself with electrical apparatus, and pursued his experiments wholly independently and unaided, so early for each. In 1807 In a cavern near his residence, called Holwell Cavern, he observed the sides and roof covered with arragonite crystallisations, and his observations led him to conclude that the crystallisations were the effects, at least to some extent, of electricity. This induced him to make the attempt to form artificial crystals by the same means, which he began in 1807. He took some of the water from the cave, filled a tumbler, and exposed it to the action of a voltaic battery excited by water alone, letting the platinum wires of the battery fall on opposite sides of the tumbler from the opposite poles of the battery. After ten days of constant action he procured crystals of carbonate of lime, and subsequently by altering the arrangements he produced them in six days. He found however that darkness was essential to the certainty and rapidity of their production. He carried insulated wire above the tops of the trees around his house to a length of a mile and a quarter, afterwards shortened to a distance of 1,800 feet. By this wire, which was brought into connection with his apparatus in a chamber, he was enabled to see continually the changes in the state of the atmosphere, and could use the fluid as collected for a variety of purposes. In 1816, at a meeting of country gentlemen, he prophesied "that, by means of electrical agency, we shall be able to communicate our thoughts instantaneously with the uttermost ends of the earth." But though he foresaw the powers of the medium, it does not appear that he took any means towards fulfilling his prophecy, or even made any experiments in that direction; he continued to confine himself to the endeavour to produce crystals of various kinds, in which he eminently succeeded, having ultimately obtained forty-one mineral crystals, or minerals uncrystallised, in the form in which they are produced by nature, including one, sub-sulphate of copper, an entirely new mineral neither found in nature nor formed by art previously. His belief was, that even diamonds might be formed in this way. Still he worked alone; he published none of his experiments to the world, and he propounded no theories. At length, in 1836, the British Association for the Advancement of Science held its meeting in Bristol, and Mr. Crosse attended it, intending to be an auditor only; but having mentioned his discoveries to some of the scientific gentlemen there, he was induced to explain them publicly, and though unprovided with apparatus, they were so struck with the importance of them, that he was publicly complimented by the president, the Marquis of Northampton, and by Dr. Buckland, Dr. Dalton, Professor Sedgwick, and others. A few months after this meeting, while pursuing his experiments for forming crystals from a highly caustic solution one of contact with atmospheric air, he was greatly surprised by the appearance of an insect. Black flint, burnt to redness and reduced to powder, was mixed with carbonate of potash and exposed to strong heat for fifteen minutes. The mixture was poured into a blackleaded crucible in an air furnace. It was redmced to powder while warm, mixed with boiling-water, kept boiling for some minutes, and then hydrochloric acid was added to supersaturation. After being exposed to voltaic action for twenty-six days a perfect insect, of the Acari tribe, made its appearance, and in the course of a few weeks about a hundred more. The experiment was repeated in other chemical fluids with the like results, and Mr. Weeks, of Sandwich, afterwards produced them in ferrocyanuret of potassium. This discovery occasioned great excitement at the time. The possibility was asserted that Mr. Crosse and Mr. Farnday had the same year that he saw similar appearances in his own electrical experiments; and he was accused of impiety, as aiming at creation. He was much hurt by these attacks, for he was a truly pious man. He says he was inclined to believe that the insects were formed from ova in the water, but failed to detect any; and adds, "I have formed no visionary theory that I would travel out of my way to support." He attempted to give no explanation of what he admitted he could not comprehend, and in answer to a person who had written to him, calling him "a reviler of our holy religion," he replied that he was sorry if the faith of his neighbours depended on the claw of a mite. These insects, if removed from their birthplace, live and propagate, but uniformly die on the first recurrence of frost, and are entirely destroyed if they fall back into the fluid whence they arose. This was the most remarkable of his discoveries; but his labours were in some instances more useful. He invented a method, which was patented by others, for purifying sea-water by electricity, which water possessed peculiar antiseptic properties; this process was also capable of being used for the improvement of wines by removing the preliminance of bitartrate of potash; to the improvement of spirits by removing its acidity; and to the stopping of the fermentation of cider. He also made experiments of the effects of electricity on vegetation. He found that positive electricity advanced the growth, as was shown by the cultivation of two vines by the lines of the largate; and that negative electricity favoured the growth of fungi, and produced something like the rot in the potato. But Andrew Crosse did not confine his labours to scientific matters. Though living chiefly on his estate in the country, he took an earnest part in all local affairs. He was an active magistrate, just, but benevolent; he advocated the introduction of the poor, and gave lectures on various subjects to the neighbouring institutes; he left a quantity of poetry, considerably above mediocrity, which he could not be induced to publish in his lifetime, but which has been given to the world by his widow, in a memoir of him written with much good taste. He had, after a severe illness, on July 5, 1855, a spring behind him the character of a pious good man, and an indefatigable searcher for truth.

CRUDEN, ALEXANDER, the author of the well-known Concordance, was born at Aberdeen in 1701. He studied at Mariscal College, but whilst there, his conduct was marked by eccentricities similar to those which characterised his later years, and, as it was found necessary to abandon his intention of becoming a minister of the Church, he came to London in April 1724, and subsisted by giving lessons in Greek and Latin. Afterwards he obtained a situation as tutor, and in that capacity resided for some time in the Isle of Man. In 1732 he opened a bookseller's shop under the Royal Exchange, and occupied his leisure hours in the preparation of his 'Concordance of the Holy Scriptures, or New Testament,' which appeared in 1737. It was dedicated to Queen Caroline, and Cruden had calculated sanguinely on her majesty's favour. The queen died however just after the publication of his book, and the disappointment brought out his latent insanity. He was removed to a private lunatic asylum at Bethnal-green, where he was confined from March 23 to May 21, 1738, when he escaped. He persisted in asserting that he was of sound mind, and brought an action against the keeper of the asylum and others; but as might be supposed, the jury was directed by the judge to find a verdict for the defendants.

Cruden published an appeal to the public, under the title of 'Mr. Cruden greatly Injured on account of a Trial between Mr. Alexander Cruden, bookseller to the late Queen, plaintiff, and Dr. Monro, Matthew Wright, John Oswald, and John Davis, defendants, in the Court of Common Pleas, in Westminster Hall, July 17, 1739, on an action of Trespass, Assault, and Imprisonment . . . with an account of several other Persons, who have been most unjustly confined in Private Madhouses. The whole tending to show the great necessity there is for the Legislature to regulate Private Madhouses in a more effectual manner than at present,' 8vo, 1739. Cruden, who appears to have been treated while in the asylum with great brutality, now found employment as a reader of printers' proof-sheets, and in the occasional preparation of indexes. Among others he is said to have compiled the elaborate index to Newton's 'Milton.'

He now published the first part of a strange kind of autobiography, under the title of the 'Adventures of Alexander the Corrector.' A second time it was deemed necessary to place him under temporary restraint at Chelsea; and again he brought an action in the Court of King's Bench against the parties who had restrained him, with as little

Digitized by Google

success as before. On obtaining his liberty he quietly returned to his ordinary occupations. Subsequently he published the second part of his Adventures, in which he gave the history of his second confinement, or 'Chelsea Campaign,' as he calls it in his title-page; and also an account of the trial, and endeavoured in vain to obtain an audience of the king in order to present a copy of the two parts. He also, as he says, "pleaded very hard that the honour of knighthood might be conferred upon him," the object being "to fulfill the prophecy about being made a member of parliament for the city of London." He seems to have actually got himself nominated (April 30, 1754,) as a candidate for the city; but he acknowledges that few hands were held up for him. In 1755 he published the third part of his Adventures, in which he relates the ill success of his petition for a pardon and a new trial; of his applications for knighthood, and for admission into the House of Commons; but the chief part is taken up with a 'History of his Love Adventures, with his Letters, &c., sent to the amiable Mrs. Whitaker, a lady of shining character and of great eminence,' in which he was as unlucky as in other matters. Impressed with a belief that he had a mission to reform the public manners, he went to preach to the prisoners in Newgate, and then made a journey to Oxford in order to preach to the students at the university. Disgusted at the reception he met with, he abandoned preaching, but arming himself with a large sponge, he went about the streets removing any expressions on the walls which appeared to him offensive to decency; and when the affair of Wilkes and No. 45 of the 'North Briton' was exciting so much public ire, his loyalty led him to the active use of his sponge in effacing the offensive number. The remainder seems to have expended itself in this harmless manner. He continued to pursue his ordinary employments, and found time to enlarge and revise his Concordance. He also published 'Alexander the Corrector's Humble Address;' and other pamphlets relating to the reformation of manners, the American war, &c., all marked by strong indications of insanity. He died at Islington in November 1770. Cruden's 'English Concordance' was far more complete and valuable than any preceding one, and it still retains its value. Three editions of it were published during Cruden's lifetime, the last and the best in 1769; it has since gone through innumerable editions of all degrees of correctness: one of the most esteemed is that of 1810.

CURRAN, JOHN PHILPOT, was born on July 24, 1750, at Newmarket, in the county of Cork, Ireland. His parents were respectable, but not wealthy; his father having been an officer in a dragoon court, and possessing the advantage of a classical education. His mother, perceiving early indications of talent, was in hopes of his becoming a clergyman, and efforts were accordingly made to procure him a suitable education. Being Protestants, they first placed him some instruction from the Rev. Nathaniel Boyse, the resident clergyman, with whom he maintained a continued friendship. He was next sent to the Free Grammar-School at Middleton, and afterwards entered as a sizar in Trinity College, Dublin. After acquiring a considerable proficiency in classical learning at that university, he abandoned his first intention of entering the church, and determined to adopt the profession of the law. Accordingly, having passed through the university with great credit, he went to London, and entered himself at the Middle Temple in 1775. There his straitened means compelled him some inconveniences, but he studied law with considerable assiduity, and practised oratory at some debating societies, where he is said to have displayed his talent for energetic and sarcastic speaking. In one of the vacations, between the terms, he returned to Ireland, and married a daughter of Dr. Creagh in 1774. By her he received a small portion, which somewhat smoothed the remainder of his term of probation, and, in 1775, he was called to the Irish bar. His success was almost immediate. His style was precisely suited to the Irish courts; humourous, discursive, often flowery and poetical, vehemently appealing to the feelings, never wearying by dry legal arguments, but when urging them enlivening their dryness by occasional witty or satirical illustrations, and he soon obtained a leading business. His social habits also operated in his favour, and though he had already adopted a political belief in opposition to the reigning government, he was a general favourite even with his political opponents, while his independent bearing to the judges won him the favour of the public. The fearlessness of his addresses however sometimes brought its inconveniences. As counsel in an action for assault by the Marquis of Donegall on a poor old Roman Catholic clergyman, he had styled Mr. St. Leger, one of the witnesses for the defence, "a renegado soldier, a drummed-out dragoon," a duel followed, when he declined returning Mr. St. Leger's fire, and the affair ended. He had been always a warm politician, and in 1782 he was returned to parliament as member for Kilbeggan, on the interest of a Mr. Longfield. As a specimen of the state of the Irish parliament, we may mention that soon after entering the House of Commons he found himself differing in political opinions with his patron, and as he had no way of vacating his seat he coolly offered to buy another seat, to be filled by any one Mr. Longfield might choose to appoint. That gentleman declined the offer; but in the succeeding parliament Mr. Curran bought a seat for himself. In the House of Commons he soon took a leading part, generally acting with Mr. Grattan and the few liberal members who then had seats. His speeches were of a very similar character to those he made at the bar, and he was often appointed to make the reply from his readiness and happy facility in retorting charges or damaging the positions of his opponents. He supported the formation of the Irish Volunteers in 1788, and the unconditional appointment of the Prince of Wales to the regency on the occasion of the king's illness in 1789, and his attacks on the government led to a duel, first with Mr. Fitzgibbon, afterwards Earl of Clare, and then with Major Hobart, in which Mr. Curran was the challenger, in both of which neither party was injured. It was in 1794 and the few subsequent years that Mr. Curran's reputation attained its climax. In the House of Commons Mr. Curran, Mr. Grattan, and others, had been continually pointing out to the government that their measures were driving the people towards rebellion. The warnings were unheeded, and in 1794 Mr. Hamilton Rowan was indicted for a seditious libel issued in the form of an address to the volunteers of Ireland from the society of United Irishmen (not the same as the rebellious societies which afterwards took this name) of which he was secretary. Mr. Curran was his counsel, and made an eloquent and vigorous defence, but Mr. Rowan was convicted and sentenced to imprisonment; and after the breaking out of the rebellion in 1798 he was the counsel generally employed by the accused, among whom the most remarkable were the two brothers Sheares, Theobald Wolfe Tone, and Napper Tandy. He had retired from the Irish House of Commons before the introduction of the measure for the Union, of which he strongly disapproved and which he ever continued to lament. The insurrection of 1803 brought trouble into his family; Robert Emmet, one of its leaders, had formed an attachment for Miss Sarah Curran, which was returned; and his correspondence with her, with his visits, sometimes secretly, to her father's house, led to a suspicion of Mr. Curran's loyalty, and to the searching of his house. He instantly waited upon the Attorney-General Standish O'Grady, and the privy council, by all of whom his perfect want of complicity was instantly admitted. Mr. Emmet had named him one of his counsel, but he did not act. Mr. Emmet was convicted and executed; his fate and his love adventure form the subject of two of Moore's 'Irish Melodies.' Upon the death of Mr. Pitt, in 1806, the Whig ministry under Lord Grenville created Curran Master of the Rolls in Ireland. This appointment did not give him satisfaction; it withdrew him from politics, and as his mind was not judicial, he felt himself out of place, he thought he had been neglected, and his health declined. He held the office till the early part of 1813, when he resigned; and he died in London on October 14, 1817. Mr. Curran in the course of his life wrote a considerable amount of verse of more than ordinary merit, but which bears no comparison with his eloquent speeches.

*DOVE, HEINRICH WILHELM, the eminent meteorologist, professor in the University of Berlin, was born October 6, 1803, at Leignitz, where his father was a merchant. He was educated in the first instance at the Ritter akademie of his native town, whence he proceeded in 1821, to Breslau, and thence, in 1824, to Berlin, applying himself in the latter places chiefly to physical and mathematical studies. In 1826 he graduated, on which occasion he read an Essay, 'De barometri mutationibus,' which was printed at Berlin in the same year. From Berlin he went, in 1828, to Konigsberg, as private teacher in the University, where he was created professor extraordinary in 1828; but in the following year he exchanged that for a similar post in the University of Berlin. Somewhat later he was appointed ordinary professor, and admitted into the Academy of Sciences.

Professor Dove has, as a man of science, devoted his attention to the comparison and elucidation of the observations and researches which, throughout the civilised world, have been made on the temperature of the atmosphere at the surface of the globe—in other words, on the circumstances which determine the climate of the various regions—and in the investigation he has exhibited a power of patient continuous inquiry, calm inductive reasoning, and broad generalisation, which have been attended with the most important results, and he has laid for the student a precise scientific basis on which he may labour with entire confidence. In place of what was, to a great extent, vague hypothesis, under his hands the true laws which regulate the atmospheric phenomena have been evolved with beautiful precision. In his Reports, and especially in his admirably-executed Isothermal Maps, he first showed, as far as recorded observations permitted, the isothermals (or lines of equal temperature) of the whole globe in every month of the year; and subsequently added the average of all the temperatures in each parallel of latitude in the same months, and the 'abnormal temperature,' or the difference of the temperature of each place, and the mean temperature of its parallel, in annual variations, and other correlative information; thus embodying in a tangible and accessible form the collation and analysis of innumerable observations and corrections, and placing in the hands of the scientific world a body of general results educed with profound skill, and of which the importance to the investigator of this branch of physical science can hardly be overrated. Among the special results of his inquiries, may be mentioned his development of the thermal influence of the Gulf-stream; his view of the different relations which prevail where the atmosphere rests on a solid, and where on a liquid base; the separation of the pressures of the aqueous and gaseous portion of the atmosphere, by which, as Sabine notes, he has given "a new aspect to this

Digitized by Google

beautiful branch of physical investigation;" and his recognition of what he termed "the law of rotation" in both hemispheres, and which, in the words of Humboldt, he showed to be "the cause of many important processes and extensive movements in the aërial ocean."

Professor Dove has published many of his investigations and discoveries in the Transactions (Abhandlungen) of the Berlin Academy of Sciences, and in Poggendorf's 'Annalen.' Among the more important of his separate works may be named his 'Über Mass und Measen,' 2nd ed, 1833; 'Meteorologische Untersuchungen,' 1837; Über die nicht periodischen Anderungen der Temperaturvertheilung auf der oberfliche der Erde,' 4 parte, 1840-7; 'Untersuchungen im Gebiete der Inductions-elektricität,' 1843; 'Uber den Zusammenhang der Wärmeveranderungen der Atmosphäre mit der Entwickelung der Pflanzen,' 1846; 'Temperaturtafeln,' 1848: 'Monatsisothermen,' 1850; 'Bericht tiber die 1848 und 1849 auf den stationen des meteorologischen Instituts im preussischen Staate angestellten Beobachtungen,' 1851; 'Witterungs-geschichte, 1840 bis 1850,' 1853; 'Darstellung der Farbenlehre und optische Studien,' 1853; 'Isothermes,' 2nd ed, 1853; 'Verbreitung der Wärme in der Nordlichen Hemisphäre,' 2 Maps, 1855; 'Darstellung der Wärme-Erscheinungen durch fanftaigte Mittel v. 1782-1855,' 1856. For a wider circle of readers he prepared his more popular works,—'Die Witterungsverhältnisse von Berlin,' 1842, in which he has given in a lively yet perfectly lucid manner, a systematic view of meteorological phenomena; his 'Uber Wirkungen aus der Ferne,' 1845; and his 'Uber Elektricität,' 1848. He has also edited the periodical work, 'Repertorium der Physik,' 8 vols., 1836-49. Professor Dove is a foreign member of the Royal Society of London, which learned body has awarded him their Copley medal for his researches in meteorology.

* EDWARDS, HENRI-MILNE, or MILNE-EDWARDS, a distinguished naturalist and professor of zoology in the Faculty of Sciences at Paris, was born at Bruges in 1800. His father was an Englishman, who had settled in the West Indies, where his eldest brother William Frederic, distinguished as a physiologist, was born. He is well known for an 'Essay on the Physical Agents which affect Life,' and other works. Milne-Edwards was educated for the medical profession, and took his degree as Doctor of Medicine in Paris. One of his first publications was entitled 'Manuel de Médecine Medicale.' It contained an abridged description of medicines, the botanical character of medical plants, and an account of the medicines found in the various Pharmacopœias. It was published in 1825. The following year he also published a 'Manual of Surgical Anatomy' containing an anatomical description of the human body divided into regions, and an account of the various diseases to which the organs of the body are liable. His medical studies led him to the pursuit of natural history, and in 1832, in conjunction with Jean-Victor Audouin [AUDOUIN], he published a work on the natural history of the coasts of France. This work was published in two volumes, and illustrated with numerous plates. His next work, and that on which his great reputation as a naturalist principally rests, was devoted to the family of *Crustacea*, which includes the lobster, crab, and shrimp. He studied their anatomy and habits with great profoundly, devised a new nomenclature for their parts, and added a large number of new species to the family. It appeared in the series of works entitled 'Suites à Buffon,' and was comprised in three volumes published from 1834 to 1841. In 1840 he commenced the publication of his 'Elements of Zoology,' which appeared in four volumes, with 600 illustrations. This work was one of the most acceptable that had hitherto been published with a view of popularising the existing knowledge of geology. It has been succeeded by several similar works both in the German and English languages. A smaller work was also published under the title of 'Cours élémentaire de Zoologie,' in 1841, which has been translated into English. In the same year he also published his observations on the compound Ascidian Mollusca. This work was beautifully illustrated, and threw much light on the structure and physiology of this branch of the animal kingdom. He has also devoted attention to the study of the polypa. He was the first to suggest the classification of the ascidian polypa with the mollusca. He has published a work on the anatomy, physiology, and arrangement of the recent forms of polypa. He has also contributed one of the most complete monographs on extinct polypes to the publications of the English Palæontographical Society. His contributions to the periodical literature of France on various zoological subjects have been very numerous. He is one of the editors of the 'Annales des Sciences Naturelles.' He wrote the 'Resumé d'entomologie' for the 'Encyclopédie portative,' and has written the articles 'Infusoires,' 'Polypes,' 'Zoophyte,' 'Insecte,' 'Arachnide,' 'Crustacées,' 'Annelids,' 'Cirripeds,' for the 'Histoire Naturelle des Animaux sans vertèbres' of Lamarck. Milne-Edwards is well known in England, and received a medal from the Royal Society for his scientific researches in 1856.

* FARR, WILLIAM, M.D., F.R.S., Superintendent of the Statistical Department in the General Register Office, was born at Kenley in Shropshire, on the 30th of November, 1807. From the age of two years he was educated by Joseph Price, Esq., at Dorrington, near Shrewsbury, his early studies being directed by the Rev. J. J. Beynon. In May 1826 he became the pupil of T. Sutton, Esq., surgeon at the Salop Infirmary; and at the same time he became the private pupil of Dr. J. Webster, a young physician of eminent talent, with whom he read the medical and scientific classics of the day. This course of study he continued for three years. In May 1829 he went to Paris, and entered as a student in the university of that city, where he remained for two years.

Here he had the advantage of hearing Orfila, Louis, Dupuytren, and Lisfranca lecture on various branches of medical science; Andral, on hygiene; Gay Lussac and Thenard, on chemistry; Fouillot, on natural philosophy; Geoffrey St. Hilaire, Laurenti, and Blainville, on comparative anatomy and physiology; Cuvier, on the history of the natural sciences; and Guizot and Villemain, on history and literature; and here it was, in all probability, that his mind received its decided bent towards the study of hygiene and medical statistics. After the revolution which placed Louis-Philippe on the throne, Mr. Farr travelled through Switzerland. On returning to London in 1831 he entered the University of London (now University College), and during two years attended the lectures of Grant, Carswell, Turner, Elliotson, and other eminent professors of that flourishing medical school. He then filled for six months the office of house surgeon at the Shrewsbury Infirmary, when he returned to London and commenced practising and teaching. He devoted his chief attention to medical statistics; and he attempted to establish a course of lectures on Hygiology, but failed—lectures on public health not being recognised by any of the public licensing bodies in the United Kingdom. He also edited the 'Medical Annual,' wrote for the medical journals, and edited, in conjunction with his friend Dr. R. Dundas Thompson, the 'British Annals of Medicine' in 1837.

In that year Dr. Farr wrote the article 'Vital Statistics' in M'Culloch's 'Statistics of the British Empire,' and from that time, fully recognising—to use his own words—"the magnitude of the subject, and the fact that more than a million of the inhabitants of the United Kingdom are disabled by disease and suffering to a less importance than the consideration that their condition may be ameliorated to an immeasurable extent" ('Vital Stat.,' vol. ii., p. 568)—he devoted all his energies to the improvement of the public health. The registration of all the deaths, and of the causes of death, in England and Wales, was commenced in 1837; and in 1838 Dr. Farr was, at the instance of Sir James Clark, Mr. M'Culloch, and Mr. Lister, the first registrar-general, an appointment in the General Register Office. He has since that year been made by Mr. Graham, the second registrar-general, superintendent of a statistical department, consisting of several able men, by whom have been drawn up the new 'London Tables of Mortality,' the 'Quarterly Returns of Births, Deaths, and Marriages,' and the 'Annual Abstracts.' He has framed a new 'Statistical Nosology,' an English Life-Table, constructed with calculations of the value of life, and of the 'Value of Annuities on Lives;' and he has written annual reports on the causes of death, papers on the 'Finance of Life Assurance' and on the 'Income Tax,' Reports on the Public Health, and an elaborate Report on Cholera in England, showing under what circumstances that epidemic is fatal, and that it is regulated in its ravages by definite laws. The value of his labours in this most important department it would be difficult to over-estimate. To his admirable reports is in a great measure due the hold which the question of public health, as a matter for practical and scientific consideration, has taken upon the public mind. To the labours he has imparted precision of aim, and, besides himself largely contributing to the accumulation of materials, and the inductive reasoning upon them, he may be fairly said to have laid a scientific basis for future investigators.

In 1851 Mr. Horace Mann, Dr. Farr was appointed one of the assistant commissioners to the Registrar-General in taking the census of Great Britain in 1851. The Registrar-General, it is understood, presided specially over the Administrative Department, and Mr. Horace Mann reported on the state of Religious Worship and Education: Dr. Farr wrote the valuable and curiously-interesting Reports on the Numbers, Ages, Occupations, Birthplaces, and Conjugal Condition of the Population.

Dr. Farr has received an honorary degree from the University of New York, is a fellow and the treasurer of the Statistical Society of London, a fellow of the Royal Society, &c.

* GAYANGOS, PASCUAL DE, is a name respecting which some additional authentic information has been obtained since the appearance of the article in the body of the work. [GAYANGOS.] This distinguished scholar was born at Seville on the 9th of June, 1809. His father, then a colonel of artillery, afterwards became a general of division, and governor first of Zacatecas, a province of Mexico, and afterwards of Merida de Yucatan; his mother was a French lady of the family of De Rets. After receiving part of his education at the village of Pontlevoy, near Blois, he commenced the study of Arabic by attending the lectures of Silvestre de Sacy at Paris. He first came to England in 1825, and in 1829 married an English lady, the eldest daughter of Major Revell of Roundoak, near Egham. Of late years

Digitized by Google

Señor de Gayangos has almost ceased to contribute directly to English literature. In Spanish he has written interesting articles in the 'Semanario Pintoresco,' the 'Revista de ambos Mundos,' and other periodicals. He is a member of the Spanish Royal Academy of History, and besides contributing to its 'Transactions,' edits the 'Memorial historico Español,' a collection of ancient historical documents issued in the name of the Academy.

GMELIN, LEOPOLD, an eminent chemist and contributor to the literature of the science of which he was an equally eminent academic teacher, belonged to a family which for four generations had been actively engaged in the pursuit of chemistry, the medical sciences, and several branches of natural history, and one member of which, if not more, is still so engaged. Three of his eminent relatives have already been noticed in the third volume of this work.

Johann George Gmelin, apothecary at Tübingen, who was born in 1674, and died in 1728, had three sons, all of whom devoted themselves to chemistry and the allied sciences. The eldest Johann Conrad Gmelin (born 1707) was a physician and apothecary at Tübingen; his grandson, 'Christian Gottlob Gmelin (born 1792) was professor of chemistry in the same university. The second is the subject of the article [GMELIN, JOHN GEORGE] in vol. iii. The third son, Philip Friedrich Gmelin (born 1722), succeeded the last-mentioned in his professorship of chemistry and botany at Tübingen, and died there in 1768. His elder son was [GMELIN, SAMUEL GOTTLIEB], and his younger son [GMELIN, JOHN FREDERICK], who succeeded him in that chair, and afterwards became professor of chemistry at Göttingen, was the father of the distinguished man we have now to commemorate.

LEOPOLD GMELIN was born at Göttingen on the 2nd of August 1788. From 1799 to 1804 he attended the Lyceum in that city, and in the summer of 1804, his father's lectures on mineralogy. In the autumn of the same year, he went to Tübingen, where he practised chemical manipulation in the pharmaceutical laboratory of his near relation, Dr. Christian Gmelin (the son of Johann Conrad Gmelin and father of Christian Gottlob Gmelin, both already mentioned), and attended Killmeyer's lectures on chemistry. In the autumn of 1805 he returned to Göttingen, where he devoted himself with zeal to all branches of medical science, but especially to chemistry, for which he attended Stromeyer's lectures; he also studied mathematics. After passing a distinguished examination, he went, in the summer of 1806, to Würtemberg, and thence to Switzerland, which he traversed in all directions, hammer in hand. From the autumn of 1809 to Easter 1811 he remained in Tübingen, and then went to Vienna, where he visited the hospitals, and carried on, in Aequin's laboratory, the greater part of the experiments, which form the basis of his Doctor-dissertation 'On the Black Pigment of the Eye,' published in 1812, and afterwards in the tenth volume of Schweigger's Journal. He left Vienna in the spring of that year, and went to Italy, where he remained till the spring of 1813, chiefly at Naples, but for some time also at Rome.

The observations and collections made in these journeys supplied the principal materials of the chemico-mineralogical investigations which formed the subject of his 'Habilitation-Schrift' or thesis at Heidelberg, 'On basaltes, and minerals found in it, together with geognostic observations on the mountains of ancient Latium,' published in 1814. On his way back to Göttingen he stayed some time at Heidelberg, where the professor of chemistry, George Succow, being then recently dead, Gmelin was encouraged to give lectures on that science. Availing himself of the opportunity thus presented, he obtained the 'venia docendi' in Heidelberg, spent the remainder of the summer at Göttingen, making the necessary preparations for his new duties, and in the autumn of the same year began his career as an academic teacher in Heidelberg, which he subsequently pursued with zeal and success for nearly forty years. Twelve months afterwards he was appointed extraordinary professor of chemistry in the university. His celebrated 'Handbook of Chemistry' was then already begun. In the autumn of 1814, he went to Paris, and occupied himself chiefly with practical researches in Vauquelin's laboratory. Two years afterwards he married Luise Maurer, the daughter of a clergymen of Heidelberg, and settled there, declining the appointment of professor of chemistry at Berlin, whither he was invited in 1817, to succeed Klaproth [KLAPROTH, MARTIN HENRY], who died in that year. He was soon afterwards made ordinary professor of medicine and chemistry at Heidelberg. In 1835, he declined an invitation to fill the chair of chemistry at Göttingen, preferring to remain in his adopted home, although his emoluments there were somewhat less than they would have been, either at Göttingen or at Berlin. In the latter portion of his life he was so completely engrossed with the gigantic labour of preparing the fourth edition of his 'Handbook,' that he became quite neglectful of his health. In 1843, he had an attack of paralysis, which, though it only deprived him for a while of his power of action, destroyed the freshness and vigour of his manner; and elasticity of spirit. But he still worked at his 'Handbook' with untiring assiduity, as shewn by the volumes which afterwards appeared. In 1850, he was again attacked by paralysis, which obliged him to resign his professional functions. He still however remained active in the cause of science, and laboured earnestly at the second volume of the 'Organic Chemistry,' which he completed in May 1852. But from that time his powers, both mental and bodily, rapidly declined; an insidious disease of the brain was steadily gaining ground. In the spring of 1853 it became evident that his end was approaching, and he died on the 13th of April, in the sixty-fifth year of his age.

Leopold Gmelin's original researches in chemistry are numerous; they are all of high character, and as complete as the means of investigation existing at the time when they were instituted would admit. In 1820 he undertook, in conjunction with Tiedemann, a series of experiments on digestion; and in 1826 and 1827 these two philosophers published their celebrated work, entitled 'Die Verdauung nach Versuchen.' But the greatest service which he rendered to science,—"a service in which," in the words of competent authority, "he surpassed all his predecessors and all his contemporaries"—consisted in the production of his 'Handbuch der Chemie,' the beginning and later progress of which have been mentioned above. The late Dr. Thomas Thomson, F.R.S., afterwards Regius Professor of Chemistry in the University of Glasgow, had published the earlier editions of his 'System of Chemistry,' in which he reduced to order, in a clear and exact manner, the facts of the science, scattered at the time he wrote over a thousand different publications, and had thus himself conferred an inestimable benefit, especially on British chemists; other writers also had arranged large quantities of materials in systematic order; but for completeness and fidelity of collation, and consecutiveness of arrangement, Gmelin's 'Handbook' is unrivalled. In it the known facts of the science are condensed into the smallest possible space, but nevertheless it presents a complete picture of them. Detached and long-forgotten observations of other chemists were often indebted to the author for first giving them their true value. In this great work, to use the words adopted, in 1854, by the President of the Chemical Society of London, of which Gmelin was a foreign member, he "sets the example of putting together, in a purely objective view, and on the authority of the several investigators, all that has been observed within the domain of chemistry,—not, indeed, withholding his own opinions, but placing them side by side with those of others, and never suppressing the latter."

The 'Handbook of Chemistry,' moreover, has often directed attention to deficiencies and contradictions in existing chemical knowledge, and has thus given rise to new investigations; it has also been widely influential in extending an accurate knowledge of chemistry, not only in Germany, but wherever the science is cultivated. The first edition, which appeared in the years 1817-1819, included in a comparatively small space the extent of chemical science then known; the fourth, which was the last prepared by Gmelin himself, published from 1843 to 1852, and comprehends Inorganic chemistry, but, unfortunately, only a small part of organic chemistry. From this the English edition, now in course of publication under the auspices of the Cavendish Society, is translated by Mr. Henry Watts, B.A., Fellow of the Chemical Society of London, of whose 'Quarterly Journal' he is also the editor. The additions made by him bring the 'Handbook' down to the existing state of chemical science at the time of publication of each volume. The desire to make this work generally available to British chemists, was one of the motives which originally contributed to the establishment of the Cavendish Society. The first volume was published at the end of the year 1848; the eleventh, being the fifth of organic chemistry, has recently appeared (November 1857). The translation is continued from a new German edition.

In the Annals of Philosophy for August and September 1814, (Series I., vol. iv., pp. 115, 193,) a few months only after the appearance of Gmelin's Thesis in Germany, Dr. Thomson published satisfactory abstracts in English of the geological and mineralogical portions respectively. Of his dissertation on the black pigment of the eye, Dr. Thomson gave a short account in the same work for January 1816 (vol. vii., p. 54,) in which Gmelin's examination of the ink of the cuttle-fish, which he had found to possess very nearly the same properties with the black pigment, is compared with Dr. Prout's, then recently published.

GOGOL, NIKOLAY IVANOVICH, is a writer on whose merits a singular diversity of opinion still prevails among the Russian public, some of his admirers maintaining that he is "the Homer of Russian life," while other critics, more in accordance with the opinion of foreign readers, describe him as merely "the author of some amusing novels." Gogol himself towards the close of his life sunk into a religious melancholy, made a pilgrimage to the Holy Land, destroyed his unpublished writings, and is said to have believed that some of his most popular works had been written under the inspiration of the devil. Several publications have appeared relating to him, two of which, an 'Essay on his Life,' and 'Memoirs of his Life' (two vols. of more than 700 pages, 1856), are by the same person, a friend of Gogol's, who conceals himself under the pseudonyme of Nicholas M. . . . but whose real name is said to be Kulleah. In the earlier of these works Gogol is said to have been born on the 31st of March (N.S.) 1810; in the later, on the same day in 1809. He died at Moscow on the 5th of March (N.S.) 1852.

GRAHAM, THOMAS, a distinguished chemist, and Master of the Mint, was born in Dec. 1805, at Glasgow, where his father was a manufacturer and merchant. He was educated at the City Grammar School, and afterwards passed to the classes of the University of Glasgow. He

Digitized by Google

studied chemistry under Dr. Thomas Thomson. He took his degree of M.A. and subsequently studied at Edinburgh. In 1823 he opened a laboratory in Glasgow for the practical study of chemistry, and succeeded Dr. Clarke as lecturer on chemistry at the Mechanics Institute. In 1830 he was appointed professor of chemistry in the Andersonian University, an appointment which he held till his removal to University College, London, to take the chair of chemistry vacated by the death of Dr. Edward Turner. On the appointment of Sir John Herschel as master of the Mint, Professor Graham was appointed non-resident assayer. In this office he had to submit all the bullion received at the Mint to a uniform scientific control. In 1855, on the retirement of Sir John Herschel, Mr. Graham was appointed master of the Mint.

Professor Graham's publications on chemistry have not been numerous, but he has made some of the most important contributions that have been made to the science during the present century. One of the most valuable of these was his discovery of the law of diffusion of gases, which obtained for him the Keith prize of the Royal Society of Edinburgh in 1834. He afterwards announced the discovery of the polybasic character of phosphoric acid, and some new views on the constitution of salts. For these researches he obtained the gold medal of the Royal Society of London in 1837. His researches on the transpirability of gases obtained for him a second gold medal from the Royal Society of London in 1850. In 1850 and 1854 he gave the Bakerian lectures before the Royal Society of London, and demonstrated the existence of a diffusive power in liquids similar to that which exists in gases. To this force he gave the name of Osmosis, and showed its relation to the action which had hitherto been known under the names of Endosmosis and Exosmosis. The original views and discoveries which he has made are embraced in his work on the 'Elements of Chemistry.' For his researches and discoveries on Osmosis he received the Copley Medal of the Royal Society in 1862.

Professor Graham was the first president and one of the founders of the Chemical Society of London, which was established in 1840. He was also chosen president of the Cavendish Society on its foundation in 1846—a position which he still holds.

He has been often employed by the government in important physical and chemical investigations. In 1846 he was one of a commission to report on the ventilation of the Houses of Parliament. In 1847 he was made one of a commission for reporting on the casting of guns. In 1851, in conjunction with Professors Miller and Hoffmann, he was employed to report on the nature of the water supplied to the metropolis.

In 1836 Professor Graham was elected a Fellow of the Royal Society, of which he has been twice elected vice-president. He was elected a corresponding member of the Institute of France in 1843. He received the degree of D.C.L. at the Oxford Commemoration in 1853, and he is a foreign member of the academies of sciences of Berlin, Munich, Turin, and Washington.

* GRANT, ROBERT, M.A., F.R.A.S., author of the 'History of Physical Astronomy,' the production of which marks an epoch in the history of natural knowledge, was born at Grantoun, Strathspey, in the county of Inverness, in the year 1814. His education was interrupted at the age of fourteen by an illness which extended over a period of six years. When he recovered, he resumed his early studies in Latin, and, with no other help than books, supplied by the affectionate care of his relatives, taught himself mathematics and physical astronomy, together with the Greek, French, and Italian languages. Subsequently, for a short time, he studied natural philosophy and classical literature at King's College, Aberdeen. He then entered the counting-house of his brothers, in London, in which he remained nearly four years, devoting his leisure hours to mathematics and physical astronomy. In 1846 he formed the resolution to write the history of the latter department of science, and shortly afterwards proceeded to Paris, where he resided during 1846 and 1847, engaged in making researches for the projected work in the principal libraries of that city, and attending the scientific lectures delivered at the Sorbonne. Towards the close of the year 1847 he entered into an engagement with Mr. Robert Baldwin, of Paternoster-row, who, having become the proprietor of the 'Library of Useful Knowledge,' which he had originally published for the Society for the Diffusion of Useful Knowledge,' had begun the publication of a new series of that work, to write a short history of physical astronomy, to form part of that series. The first number was published in September 1848, but the scale of the work happily was augmented, and the whole appeared complete in the spring of 1852, forming a closely-printed volume of nearly 700 pages. It is incumbent upon us to give some account of this work. At the time when it was published, just after the completion of the first half of the present century, the only works which had any claim to be styled standard histories in either theoretical or observational astronomy, were the 'History of Modern Astronomy,' by the ill-fated Bailly, ending in 1781, but continued to 1810 by Voiron, and the well-known 'History' of Delambre, of which the first volume appeared in 1817; and both of these were becoming antiquated. In our own day no work had appeared approaching the character of a general history of the science, though only for a short period, except Mr. Airy's report on Astronomy to the British Association, at its second meeting, in 1832. Mr. Grant's volume therefore, from the time of its first appearance, was felt to supply an urgent want; and having been found entitled, by the tests applied to it and the resulting opinion formed, to rank as an astronomical classic, the gold medal of the Royal Astronomical Society was awarded for it to the author, and presented to him at the annual general meeting, February 8, 1856; on which occasion a masterly address was delivered by the president, Manuel J. Johnson, Esq., M.A., Radcliffe observer at Oxford, which has been published in the 'Memoirs' and 'Monthly Notices' for the session 1855-56. The award being the first which, during the society's thirty-six years' existence, had been conferred on literary service, Mr. Johnson first vindicated its propriety in that respect, and after a brief view of the historical literature of astronomy (from which the preceding remarks on that subject have been derived), proceeded to give a sketch of the contents and a statement of the character of the work itself:—"The first thirteen chapters of the book," he observes, "are devoted to an historical exposition of the theory of gravitation. . . . . This inquiry forms by far the most laborious part of the volume. To collect his materials, the author had not only to wade through a multitude of special treatises, but also to search the published records of all the great academies of Europe. Then the arrangement, in anything like lucid order, of the vast mass which he had accumulated, in the narrow compass of an octave volume, was no slight difficulty; and if we further consider that his facts were to be stated in language which was to satisfy the mathematician, and to be intelligible to the educated public, I think it admits of question whether the task of construction was not as great as that of collection and discussion. . . . . All that is known of the physical constitution of the sun, planets, and comets, is given in great detail in the fourteenth and fifteenth chapters, together with many valuable contributions to the literature of those subjects. Nor has the author omitted to trace the history of observational astronomy from the earliest period to the present time." "Throughout the book," Mr. Johnson continues, "no one can fail to be struck with the skill, integrity, and discernment the author has displayed in tracing the successive stages of progress; or with the scrupulous care he has taken to assign to each of the great men whom he reviews their proper share in the common labour."

Mr. Grant had been elected a Fellow of the Royal Astronomical Society on the 14th of June 1850; and in November 1852, after the publication of his book, he was appointed editor, under the superintendence of the council, of the 'Monthly Notices' of that society, containing papers, abstracts of papers, and reports of its proceedings, a periodical which may be regarded as a means of diffusing a knowledge of the present progress of astronomy equivalent in importance to the former 'Correspondence' of Von Zach and the 'Astronomische Nachrichten' of Schumacher, while it is in some respects superior to both, from its being the record of the actual proceedings of the society from which it emanates.

Mr. Grant has recently added to his scientific occupations that of a public teacher of astronomy, having delivered two courses of lectures on that science at the London Institution, the first consisting of its progress and philosophy, and of recent discoveries especially—the other elementary, adapted to a juvenile auditory, and forming part of the Educational series of the lectures at that establishment.

The title and description of his great work are as follows:—'History of Physical Astronomy, from the earliest ages to the middle of the nineteenth century. Comprehending a detailed account of the establishment of the theory of gravitation by Newton, and its development by his successors; with an exposition of the progress of research on all the other subjects of celestial physics,' 8vo, Lond., 1852, pp. 20 and 658.

GROTEFEND, GEORG FRIEDRICH, a distinguished philologist and antiquarian, was born at Münden in Hanover on June 9, 1775. He was educated in his native town and at Ilfeld till 1795, when he proceeded to Göttingen, where he became intimate with Heyne, Tychsen, and Heeren. On the recommendation of Heyne he was appointed in 1797 assistant teacher in the Göttingen town school; and after he had made himself known by his work 'De pasigraphia sive scriptura universali,' published in 1799, he was chosen pro-rector of the Gymnasium of Frankfurt-on-the-Main in 1803, and shortly afterwards con-rector. Besides many learned contributions to the 'Allgemeinen Cyclopädie' of Erach and Gruber, and to other periodical works, he published in 1815, 'Anfangsgründe der deutschen Poesie' (Elements of German Poetry), and founded in 1817 a society for the investigation of the German language. In 1821 he was called to be director of the Lyceum at Hanover, which thenceforth became his residence. In 1823-24 he published an entirely remodelled edition of Wenck's Latin grammar in 2 vols. 4to, and a smaller one for the use of schools in 1826. His most noticeable works however are those relating to the deciphering of the eastern cuneiform inscriptions, on which he expended much and successfully directed labour; and those devoted to an investigation of the old Italian languages and geography. Among these works are his 'Neuen Beiträge zur Erläuterung der persepolitanischen Keilschrift' (New Contributions towards the Explanation of the Persepolitan Cuneiform Inscriptions), 1837: and 'Neue Beiträge zur Erläuterung der Babylonische Keilschrift,' 1840. For early attempts these works possessed considerable merit, but their value has been lowered by the indefatigable labours of more recent investigators. On the Italian antiquities

he published, in eight parts, between 1835 and 1838 'Rudimenta linguæ umbricæ ex inscriptionibus antiquissimâ,' in 1839 'Rudimenta linguæ oscæ;' 'Die Münzen der griechischen, parthischen und indoskythischen Könige von Bactrien und den Ländern am Indus,' 1839, (The Coins of the Greek, Parthian, and Indoscythian kings of Bactria and of the Countries on the Indus); and in 1840-42, in five parts, his investigation 'Zur Geographie und Geschichte von Altitalien,' a work remarkable for the copiousness of its materials and the bold felicity of many of its theories. The part he took in the controversy respecting the genuineness of Sanchuniathon's 'History of the Phœnicians' has been already mentioned. [SANCHUNIATHON.] Grotefend has also published a history of the Lycians. He died December 15, 1853.

* GROVE, WILLIAM ROBERT, Q.C., M.A., F.R.S., is a native of Swansea in South Wales, where his family have been settled for above a century. He graduated in the University of Oxford. Being destined for the legal profession, he was called to the bar, as a student of Lincoln's Inn, on the 23rd of November 1835; but his practice being very soon seriously interfered with by ill health, under medical advice he quitted it for three years, and travelled on the Continent, returning in 1838, and shortly afterwards he re-entered on the practice of his profession. But he had in the int-rval given considerable attention to scientific subjects, especially electricity; and he succeeded in producing, by regular deduction from theory, the most powerful voltaic combination yet produced, well known as 'Grove's battery,' and sometimes termed the 'nitric acid battery.' Not long afterwards, in 1840, he accepted the office of experimental philosopher to the London Institution. In the laboratory of that institution he invented or discovered the 'gas battery,' in which oxygen and hydrogen gases play the part of zinc and copper in an ordinary battery, the action of the gas battery being obviously a mere play of chemical affinities converted into electricity. This instrument therefore is as instructive in a theoretical point of view as the nitric acid battery is practically valuable, and a competent authority has pronounced that nothing more important has been produced in electro-chemistry since the time of Sir H. Davy. The particular relation of mutual convertibility between chemical affinity and electricity in this and all other voltaic or galvanic batteries, Mr. Grove denominates 'Correlation,' illustrating it by the logical idea of the inseparability of 'height and depth,' 'parent and offspring.' In some lectures delivered in the course of his official duty at the London Institution, in 1842 and 1843, he explicitly and fully enunciated his views on the mutual relations of all natural forces. The substance of these lectures, with various additions, afterwards formed an essay by Professor Grove, printed for the proprietors (or members) of the London Institution, and also published in 1846, under the title of 'The Correlation of Physical Forces,' of which the author has since published two enlarged editions, the second of which appeared in 1850, and the third in 1855. This work has been translated into French by the Abbé Moigno. That a relation of equivalence and mutual convertibility existed among the various forces of nature had often been suspected or affirmed, and indeed the existence of a connection of this kind between several pairs of them established; for example, the mutual and equivalent convertibility of heat and mechanical force had been proved by Carnot. But it was reserved for Mr. Grove to announce in the most general and explicit manner the proposition, that all physical forces are so related to each other that all might be and in nature are resolved into any one, and any one into all. Thus, that heat might be converted into chemical action, and chemical action into heat, both into electricity, electricity into magnetism, magnetism into mechanical force or electricity, and so on in a perpetual cycle: in the actual state of science however some pairs of these forces are not directly capable of mutual conversion, but require the intervention of another, which the first is capable of becoming, and which is itself capable of becoming the second. The influence of Mr. Grove's views on this subject upon the researches and researches of his contemporaries has been marked, though almost tacit. It may be traced in the subsequent researches of Professor Faraday, and is obvious in those of Mr. Joule. We conceive that Mr. Grove is the true discoverer of the cause of the heat of friction, which he refers to the subdivision of the mechanical motion of the masses of the rubbing bodies into the vibrations of their molecules, constituting heat. In connection with this he urges the theoretical importance of the facts, that while the friction of similar bodies produces heat, that of dissimilar bodies produces electricity, the recognition of which also was first made by him. .

Though Mr. Grove has not failed to receive the rewards due to his brilliant experimental productions in the position he has acquired in the world of science, yet we think the originality of his principle of the correlation of physical forces, as a whole, has not been adequately appreciated. Thus, in the address of the President of the British Association, the Rev. Dr. Lloyd, at the last meeting, at Dublin (1857), we find Mr. Grove regarded as "one of the able expounders" of modern views of the mutual convertibility of different kinds of force, not, as he truly is, as the original enunciator, in all its generality, of the doctrine of that entire, exhaustive, and cyclical convertibility which is denoted by the term 'Correlation' as understood by Mr. Grove. This may have arisen however, as we must in fairness state, from the almost purely dogmatic form in which the author has proposed his views, and also from two other causes. The first of these is the fact, that in some cases he has sought to establish his point by argumentations somewhat sophistical, by forensic rather than philosophical reasoning, passing by some relevant but hostile truths, and thus proving, or seeming to prove, rather a verbal than a real correlation. The second is, that, while the entire system of known physical truths conspires to prove the existence of distinct orders of matter, having, logically speaking, a discrete difference from each other—what has been termed gross or ordinary matter and the ether, for example—Mr. Grove, with some impatience, ignores the separate existence of the latter, saying that there is no specific ether because everything is matter, and even referring the phenomena of light itself, not to the undulations of the ether, but to the vibrations of the ordinary matter through which it passes, or by which it is affected alone. We leave those philosophers who know that the demonstration of the undulatory theory of light is also that of the existence of the ether, to reply to this, simply remarking that to deny the existence of more than one order of matter, because all must be matter, is not more reasonable than it would be for a theorist in zoology to deny the separate existence of birds or reptiles because each group is an element of the higher group of vertebrate animals, affirming that the category of the latter is the only existing one, or, in other words, that all vertebrate animals are alike, or that all are birds.

But these blemishes scarcely impair the substantial value of the philosophical doctrine of the correlation of physical forces, though they have probably retarded its full appreciation. It is no doubt but the first leading period in the course of a beneficially close study and researches of philosophers; though it will lead, we think, to some generalisations not contemplated by the author, and altogether subversive of his collateral views; establishing, on the one hand, the reality of the correlation of physical forces, but proving, on the other, the existence of discrete orders of matter, of which these forces are affections—'modes of motion'—some of one, some of another order. Many, and perhaps all of the phenomena of nature however must have, as it will also appear, a two-fold origin, being derived in part from one or more of these modes of motion, and in part from the substantial properties of the moving medium, an explanation which the phenomena of heat, for example, absolutely require, and which is already admitted with respect to those of light.

Mr. Grove's professional engagements occasioned his retirement from the London Institution in 1847; but he has by no means abandoned research, and still less the administrative business of science; taking a more or less active part in that of the Royal Society (of which he was elected a Fellow on the 26th of November 1840), the Royal Institution, and the British Association. The new rules of the Royal Society for the election of fellows, enacted in 1847, he was the principal means of introducing, having virtually carried the measures of previous unsuccessful reformers, with modifications of his own and of his supporters.

The numerous papers in which he has made public the results of his experimental researches, principally on electricity, will be found chiefly in the 'Philosophical Magazine' (from 1838 almost to the present time), the 'Philosophical Transactions,' and the recently-published 'Proceedings' of the Royal Institution. The powerful voltaic combination of four elements, which has been named after its discoverer, consisting of plates of zinc and platinum, arranged in porous vessels, charged with the sulphuric and nitric acids, is described in the 'Phil. Mag.,' S. 3, vol. xv. (for October 1839), p. 287. The gas battery was first described in the same work, for December 1842, S. 3, vol. xxi. p. 417, and afterwards in a more complete paper communicated to the Royal Society in 1843. In the Bakerian Lecture, in November, 1846, he described an experiment in which, by the intense heat of the voltaic discharge independently of chemical action he effected the decomposition of water; a result however which some have thought might be due to the decomposing power of the voltaic light. However this may be, the experiment is of great importance, not merely in chemistry, but in geology, because it shows, as Mr. Brayley has pointed out, that water, as such, cannot exist at temperatures which, we have every reason to believe, occur at certain depths within the earth, but must be resolved into hydrogen and oxygen gases in a state of rigid expansion, though under enormous pressure. Mr. Grove received the Royal medal from the Royal Society, in 1847, for his Bakerian Lecture, delivered before the Society, November 19, 1846, "on certain phenomena of Voltaic Ignition, and on the Decomposition of Water into its constituent gases by Heat." The professional honour of being appointed Queen's Counsel he received in 1853.

HALDANE, ROBERT, son of Captain James Haldane of Glenegles, Perthshire, was born in London, February the 28th, 1764. He was educated at the High School of Edinburgh, and subsequently matriculated at Edinburgh University; but in 1780 he abruptly quitted the University to enter the naval service on board the ship Monarch, of which his uncle, Captain, afterwards Lord Duncan, was commander. At the peace in 1783 he left the service and resumed his studies at the university. During the summer vacations he travelled on the Continent. In 1785 he married Katherine Cochrane Oswald of Scotstown, sister of R. A. Oswald, afterwards M.P. for Ayrshire.

Digitized by Google

In 1786 he settled at the family residence at Airthrey, near Stirling, and for several years paid assiduous attention to the improvement of his estates, his successful efforts in landscape gardening attracting particular attention, and stimulating other landed proprietors to the adoption of similar plans. Robert Haldane, and his younger brother [HALDANE, JAMES A.] were about the same period led to turn their thoughts to the paramount importance of personal religion, and the duty of diffusing the knowledge of it. The operations of the Serampore mission becoming known to him, Robert determined to make an effort for the religious instruction of India, and sold the greater part of his estate for the purpose of obtaining funds. Permission could not be obtained however from the East India Company and the government, and the scheme was necessarily slandoned. The brothers now turned their attention to the state of religion in Scotland, and originated the measures for the extension of religious instruction by means of itinerant preaching, Sabbath schools, tract distribution, &c. In three plans they had the co-operation of the celebrated Rowland Hill and the Rev. C. Simeon of Cambridge. On the Calton Hill at Edinburgh, Rowland Hill had on some occasions a congregation of 20,000 persons. These measures met with much opposition from the Established and Dissenting Churches in Scotland, but eventually issued in the formation of the Scottish Congregational Union, and likewise, in consequence of differences which arose, gave rise to the formation of several Baptist churches in various parts of the country. Mr. Haldane likewise took an active part with Mr. Zachary Macauley in a scheme which was set on foot for bringing over from Sierra Leone the children of African chiefs to be educated in the country. In 1809 Mr. Haldane purchased the estate of Auchingray in Lanarkshire, which was subsequently his principal place of residence. In 1816 he published a work on the 'Evidences and Authority of Divine Revelation,' which passed through several editions. The winter of 1816-17 was spent by him in Geneva, and the following two years at Montauban, the seat of the second learning French Protestant seminaries. At these places, by his private meetings for exposition of the Scriptures, his conversation with ministers and students, by the publication of tracts and treatises, and by judicious counsel and liberal pecuniary aid, he originated that revival of religion which issued in the formation of the modern evangelical school of Geneva, and the extension of Protestant Evangelism in various parts of France. The formation of the Continental Society, and similar religious associations on the Continent, the extensive employment of colporteurs, who in selling Bibles and other religious works have taken religious truth into almost every nook and corner of Continental countries, may all be traced more or less directly to Mr. Haldane's operations in 1816 19. Among his pupils at Geneva were Ganseco, Merle D'Aubigne, Meian, Monod, and other names subsequently known for zealous and successful efforts in extending the new Evangelical doctrine. After his return Mr. Haldane continued to manifest a deep interest in various religious efforts at home and abroad. He took a decided stand in opposition to the circulation of the apocrypha under the sanction of the British and Foreign Bible Society. He died at Edinburgh on the 12th of December 1842, and was buried within one of the walls of the Cathedral church of Glasgow. He published a treatise on the Plenary Inspiration of the Scriptures, of which seven editions were published. His most important production was an 'Exposition of the Epistle to the Romans,' in 3 vols., of which six or seven editions have appeared.

HALDANE, JAMES ALEXANDER, son of Captain James Haldane of Gleneagles, was born at Dundee, on the 14th of July 1768, within a fortnight after his father's death. In many respects his career was a counterpart of that of his elder brother Robert. In 1777 he accompanied his brother to the High School of Edinburgh, and subsequently pursued his studies at the university. Declining a partnership which was offered him in connection with Messrs Coutts's Bank, London, he entered in 1785 the East India Company's naval service. In 1793 he obtained the command of the Melville Castle East Indiaman. In September of that year he married the only daughter of Major Joan of Cullesoard in the county of Banff. At the close of this year he succeeded by his courage and presence of miud in quelling a mutiny which broke out in a ship which lay near the Melville Castle, in Portsmouth Harbour, and which was beginning to assume an alarming appearance. His views on religious matters becoming more decided, he at length resolved on retiring from the sea. Early in 1794 he rejoined his wife in Scotland. Soon afterwards he took up his residence in Edinburgh, and manifested a deep interest in various efforts for the religious instruction of the people. He took a leading part in the preaching tours which were undertaken through various parts of Scotland, io the establishment of Sunday schools, and other Christian efforts. In December 1797, the Society for Propagating the Gospel at Home was instituted. In February 1799 Mr. James Haldane became the first pastor of the Tabernacle Circus Church. In May 1801 the congregation removed to a new Tabernacle, built at the head of Leith Walk, at the entire cost of Mr. Robert Haldane. In 1808 Mr. James Haldane having changed his views with respect to Infant Baptism, although he left the communion open to parties who might differ in their views of this question, many of the members of his church left. Mr. Haldane continued minister here till his death, which took place on the 8th of February 1851. Mr. Haldane published numerous pamphlets on subjects which at the time excited attention in the religious world. Among his larger treatises may be named his works on 'The Doctrine of the Atonement;' 'On Christian Unity;' his 'Exposition of the Epistle to the Galatians;' and 'Views of Social Worship.' Some of his pamphlets were directed against the opinions of the Irvingites.

HALÉVY, FROMENTHAL, a French dramatic composer, was born about the year 1810. He was educated at the Conservatoire de Paris, when Cherubini was at its head, and was a special and favourite pupil of that illustrious musician. He is the author of a number of operas, particularly 'Guido et Ginevra,' 'Les Mameluckes ou le Reine,' 'La Fée aux Roses,' 'Le Val d'Andorre,' and some others, which do honour to the modern French school. In 1851 'La Tempesta,' an Italian opera, founded on Shakspere's 'Tempest,' the poem by Scribe, originally written in French, and translated into Italian), and the music by Halévy, was produced at Her Majesty's Theatre with no great success; for, although the music met with deserved admiration, yet the strange liberties taken by the Parisian dramatist with Shakspere's text were by no means to the taste of the English public. [See SUPPLEMENT.]

HAMMER-PURGSTALL, JOSEPH, BARON VON, was born in 1774 at Grätz in Styria, where his father held a respectable post under the Austrian government. He was educated at Vienna, and in 1788 removed to the Oriental academy established by Prince Kaunitz. After having taken a part in the compilation of Meninski's Arabian, Persian, and Turkish Lexicon, he was appointed in 1796 secretary to the Baron von Jenisch, the reporter to the Oriental section in the ministry for foreign affairs. While in this employment he translated the Turkish poem on the Last Judgment, and supplied several other poems to Wieland's 'Deutsches Museum.' In 1799 he was elected to the embassy of the learned Baron von Herbert at Constantinople, who sent him with one of the imperial consuls on an important errand to Egypt, where he procured for the imperial library some valuable additions to its hieroglyphic collection, the purchase at Sakkara, several Arabian manuscripts, and other rarities. As interpreter and secretary he made the campaign in Egypt under Hutchinson, Sir Sidney Smith, and Jusauf Pacha, against Menon, and in the autumn of 1801 proceeded by Malta and Gibraltar to England. After his return to Vienna in April 1802, he was appointed, by the Austrian ambassador, the Baron von Sturmer, as secretary of legation to Constantinople. In 1806 he was appointed consular-agent in Moldavia. In 1807 he returned to Vienna; in 1811 he was made a state counsellor, and appointed court and state interpreter; in 1817 promoted to the imperial privy counsellor; and in 1845 created a baron, after having succeeded to the estates of the Countess von Purgstall. In 1815 he had occupied himself earnestly in procuring the restoration of the Oriental manuscripts and other treasures which had been carried from the Vienna library to Paris, and by Denon, after the occupation of Vienna by the French in 1809. In 1847, continuing to be in the active service of the department of foreign affairs as counsellor extraordinary, he was chosen president of the newly-instituted academy, which he resigned, after holding the office for two years, in favour of Count Thun-Hohenstein. The years he spent on his estate of Hainfeld in Styria, where he laboured on his very numerous literary works, and where he died on November 21, 1856. His works are extremely numerous, and those of a historical character highly valuable. His publications of Turkish, Arabian, and Persian poems are in many instances interesting to the general reader, but his philological knowledge was not sufficiently exact to enable him to render them satisfactory to the student. Among the more noticeable of his historical works are 'The Trumpet of the Holy War,' 1806; 'The Constitution and Government of the Ottoman State,' 1816; 'Glances upon a Journey in 1804 from Constantinople to Brussa and Olympus, and thence back by Nicæa and Nicomedia,' 1818; 'History of the Assassins, from Eastern Sources,' 1818, a work which has been translated into English by Mr. Wood; 'Constantinople and the Bosphorus, topographically and historically described,' 1821; 'Fundgruben orab., pers. turk., bibliothecæ cæs.,' 1822; 'History of the Ottoman Empire,' in ten volumes, 1827-1834, an excellent work, of which several editions have been published; 'The Government under the Khalifate,' 1835; 'Picture Gallery of the great Ottomanian Commanders, with Memoirs,' in six volumes, 1837-39; 'History of the Golden Horde of Kiptschak, that is, of the Mongols in Russia,' 1840; 'History of the Ilkhane, that is, of the Mongols in Persia,' 1842-44; all those contain a vast collection of materials relating to the history and present state of the East. Of his other productions we may mention, 'Schirin,' a Persian poem, 1800; his translation of the 'Divan' of Hafis, from the Persian, 1813; his 'History of the Literature of Persia, with specimens from 700 poets,' 1818; 'The Eastern Trefoil,' from Persian, Arabian, and Turkish sources, 1818; 'The String of Jewels,' from Abul-Maanis, 1823; a translation of the Arabian lyrical poet Metanebbi, 1823; a translation from the Turkish of the lyrical poems of Baki, 1825; a 'History of Turkish Poetry, with selections from 2300 poets; Fasli's allegorical Turkish Epic of the Rose and Nightingale, 1834; Samascheri's Arabian poem of the 'Golden Necklace,' 1835; Mahmud Schebistere's didactic poem on Suffism, entitled 'The Rose-bloom of Secrets,' 1838; 'The Falconer,' an old Turkish didactic poem on falconry, 1840; and a 'History of Arabian Literature,' in three vols. 1850-52. He has also written a volume 'Memuon's Drieklang'

Digitized by Google

(Mermon'a Triad), containing an Indian pastoral, a Persian opera, and a Turkish comedy. For his translation of the 'Contemplations of Marcus Aurelius' into Persian, published in 1831, he was rewarded by the Shah with the order of the Sun and Lion. In 1810 he established a periodical work, 'Mines of the Orient,' to which he contributed much, and in which he was assisted by Count Wenzel Rzewuski, which was continued till 1819; and he was a frequent contributor to the 'Jahrbüchern fur Literatur' (Year-books for Literature), and to other periodical works.

HAVELOCK, MAJOR-GENERAL, SIR HENRY, K.C.B., was born in 1795 at Bishopsweermouth, near Sunderland, at which latter town his father carried on an extensive business as a ship-builder and merchant. His father having retired from business, and purchased Ingress Park, Dartford, Kent, Havelock was sent to the Charterhouse school, where he distinguished himself by his application and success, and where he had for contemporaries the Greek historians, Thirlwall and Grote, Archdeacon Hare, Sir Charles Eastlake, and several others who have attained eminence in various walks of life. The bar being the profession selected for him, he in 1813 was entered of the Middle Temple, and attended the lectures of Chitty. His own inclination was however for a military life. His elder brother William was in the army, and had attracted favourable official notice by his gallant conduct on more than one occasion in the Peninsula—honourable testimony is borne to his merits in Napier's 'History of the Peninsular War'—and through him Henry applied for a commission. In July 1815 he was made second lieutenant in the Rifle Brigade, and he served with his regiment in England till 1823, when having exchanged into the 13th Light Infantry, he embarked for India. Save from this time his career of active duty may be dated, he being engaged in almost every subsequent Indian campaign. The Birmese having made various inroads upon the British territory, and collected large armies with the avowed determination of driving the English out of Arakan, Lord Amherst in March 1824 issued a formal declaration of war against the king of Ava. Havelock was appointed Deputy-Assistant-Adjutant-General, and in that capacity took part in the chief operations of the war. When the court of Ava was constrained to sue for peace, Havelock was named one of a commission to obtain the royal signature to the treaty which was concluded in February 1826.

Lord Combermere having formed a military depôt at Chinsurah, Havelock was appointed adjutant of it in 1827. About this time he married the daughter of Dr. Marshman [MARSHMAN, JOSHUA] the learned Baptist missionary at Serampore, with whose religious opinions his in a great measure coincided: and it is noteworthy, as an illustration of the extent to which deference to Hindoo notions has been carried in India, that it was long after made a matter of serious complaint against Havelock that he was accustomed to hold meetings in his quarters for religious worship, and the charge was one duly investigated by the higher authorities. On the breaking up of the Chinsurah depôt Havelock returned for awhile to his regiment; afterwards proceeded to Calcutta, passed an examination in the native languages, and was appointed regimental adjutant. On the breaking out of the first Afghan war in 1838, Captain Havelock (for he had in this year, after twenty-three years' service, been promoted to a company), was placed on the staff of Sir Willoughby Cotton, and accompanied the army throughout the campaign, being present at the storming of Ghuznee, the capture of Cabul, &c. He published an account of this campaign, 'A Narrative of the War in Afghanistan in 1838, 1839,' 2 vols. 8vo, Lond., 1840.

Captain Havelock was now sent to the Punjab with a detachment, and joined as Persian interpreter on the staff of Major-General Elphinstone. On the recurrence of difficulties in Afghanistan in 1841, he joined the force of General Sale, and shared in the desperate fighting through the Khoord Cabul pass and the difficult country beyond it to Jellalabad; in the protracted and noble defence of which fortress, as well as in the final defeat of Akbar Khan in the open field, April 7, 1842, the name of Havelock was one of the most distinguished, and he received the well merited reward of a brevet majority and the companionship of the Bath. As Persian interpreter he accompanied General Pollock in his march, and took part in the several encounters in which the army engaged. In 1843 he was appointed Persian interpreter on the staff of General Sir Hugh (now Viscount) Gough, and fought in the battle of Maharajpoor in which the Mahrattas, 18,000 strong, were defeated with a loss of about 3,400 men. In 1844 he was made lieutenant-colonel by brevet. The following year was marked by the commencement of the Sikh war. He was present at the battles of Moodkee, December 18, 1845 (where two horses were killed under him), Ferozeshah, December 21, 22, and Sobraon (where he lost another horse) February 10, 1846. When peace was restored he was appointed Deputy-Adjutant-General of the Queen's troops, at Bombay. In 1849 he came to England on leave of absence for two years on account of ill-health. On his return to India, Lord Hardinge, who had witnessed his gallantry and skill in the Sutlej, made him first Quarter-Master-General, and then Adjutant-General of the Queen's troops in India.

When the Indian government declared war against Persia, Colonel Havelock was despatched with the expeditionary force under General Sir James Outram, as chief of the staff, and took part in the brilliant affair of Bushire, and was present at the capture of Mohammerah. The war ended, he embarked in the Erin for Calcutta, with the gallant 78th. The vessel was wrecked, April 1857, off Ceylon; but happily Havelock and his brave comrades were spared to do memorable service in the rescue of their countrymen and countrywomen subjected to far more fearful peril than that of shipwreck, and in inflicting retribution on their brutal assailants.

Immediately on reaching Calcutta he was despatched with the rank of Brigadier-General to Allahabad. He left that city on the 8th of July at the head of a column of little over 2000 Europeans and Sikhs in the hope of relieving the garrison and residents shut up in Cawnpore. He had to force his way against terrible odds, but he made good his ground, and on the 16th of July he defeated Nana Sahib at the head of some 13,000 mutinous sepoys—his own force being 1200 European soldiers and about 700 Sikhs. On the 17th he entered Cawnpore, too late notwithstanding all that he and his noble army had done to save their unhappy countrymen, yet he had in the last eight days marched 126 miles, and won four actions against overwhelming odds. Hardly waiting to give rest to his men or to pay the last rites of sepulture to the mangled corpses of those who had been fondly murdered in Cawnpore, Havelock prepared to push on for Lucknow. On the 19th of July he again inflicted a severe defeat on the mutineers, and finding that Nana Sahib had evacuated his stronghold of Bithoor, renewed his march. But he had to fight at every step, stout fortresses had to be captured, and at length after on the 16th of August achieving his ninth victory over six times his own numbers, he found his men so reduced by death, wounds, and sickness as to render it imperative on him, after almost standing within sight of the sacred citadel to fall back on Cawnpore —not however without being able to communicate cheering words to the besieged. Being strengthened by the arrival of General Neill with a small additional force, and joined by his old commander, General Sir James Outram, Havelock at the head of 2,800 men crossed the Ganges from Cawnpore on the 19th of September. Sir James Outram—one of the best and bravest of the many officers who have achieved eminence in India—would of course, as the superior in rank, in the usual order of things supersede Havelock as commander, but with the generous chivalry of a true-hearted soldier, he in an order of the day announced to the army that "In gratitude for and admiration of the brilliant deeds in arms achieved by General Havelock and his gallant troops," he would "cheerfully waive his rank on the occasion, and accompany the force to Lucknow in his civil capacity as chief commissioner of Oude, tendering his military services to General Havelock as a volunteer." On the 21st of September the fortified position at Meangarnour was forced; on the 25th Lucknow was reached, and the garrison, which had been blockaded for nearly four months, relieved, just as it had been mined and was ready to be blown up by the besiegers. The following day the intrenchments of the enemy were stormed, though with great loss, including that of the gallant General Neill, and expelled from a large part of the city, though in and about it 50,000 of the enemy are said to have been posted. According to the latest intelligence, Havelock with his army, who, also was wounded, was shut up in Lucknow; but Sir Colin Campbell, at the head of a large body of troops, was rapidly advancing to his relief.

We need hardly add that the splendid march of Havelock on Cawnpore and the relief of Lucknow have not merely rendered him the popular hero of the Indian war, but added new glories to the British arms. As a reward for his eminent services he was created (Sept. 1857) a Major-General in the army, his promotion bearing date July 30, 1857, made a baronet, and raised to be a knight-commander of the Bath; and, in accordance with a royal message to both houses of parliament, voted a pension of 1000*l*. a year for life, but which, it is officially announced, will be continued to his son. (We are indebted for some of the facts of his early career to the 'London Illustrated News' for September 12, 1857.) [See SUPPLEMENT.]

HENFREY, ARTHUR, a distinguished botanist. He was educated for the medical profession, and studied at St. Bartholomew's Hospital in London. Ill health, and a taste for botanical pursuits, led him to abandon his profession and devote himself to scientific studies. One of his earliest scientific labours was a work on 'Anatomical Manipulations; or the methods of pursuing practical investigations in Comparative Anatomy and Physiology,' in preparing which he was assisted by Mr. Tuik. This work appeared in 1844. About this time he was appointed botanist to the Geological Survey of the United Kingdom, but he only retained this position a short time. He afterwards became lecturer on botany at the Middlesex Hospital School of Medicine, and also at the St. George's Hospital School of Medicine. In 1847 he published his 'Outlines of Structural and Physiological Botany.' This work was a condensed view of the state of botanical science at the time it was written, and contained a large number of plates from the author's own drawings. He subsequently published a smaller work, intended as an elementary introduction to botanical science, entitled 'The Rudiments of Botany.' In 1852 he published a condensed view of the botany of Europe, entitled 'The Vegetation of Europe: its conditions and causes.' His last original work was published in 1857, with the title, 'An Elementary Course of Botany—Structural, Physiological, and Systematic; with a brief outline of the Geographical and Geological Distribution of Plants.' This work is one of great labour, research, and judgment, and justly places Mr. Henfrey among

Digitized by Google

the most distinguished botanists of the day. Mr. Henfrey's papers on particular departments of botany are numerous. He has been a frequent contributor to the 'Annals and Magazine of Natural History.' He edited for some time the 'Botanical Gazette.' In the 'Transactions of the British Association' for 1851 he published a report 'On the Reproduction and Supposed Existence of Sexual Organs in the Higher Cryptogamous Plants.' In conjunction with Dr. Griffiths, he was the author of the 'Micrographic Dictionary,' and wrote all the articles in that work devoted to vegetable physiology. This work appeared in parts, and was completed in 1857.

Whilst constantly engaged in the production of original works, Mr. Henfrey has been a laborious translator from the German. In 1849 he translated a volume of Reports and Papers on Botany for the Ray Society, and in 1852 Alexander Braun's 'Rejuvenescence in Nature' for the same society. In 1853 he translated Schleiden's 'Plant, a Biography,' and in 1852 Professor Schouw's 'Earth, Plants, and Man.' He also constructed the maps and wrote the letterpress on the geographical distribution of Plants in Johnston's Physical Atlas.

On the resignation of Professor E. Forbes, Mr. Henfrey was appointed professor of botany at King's College in 1854. He also holds the appointments of examiner in natural science to the Royal Military Academy, and to the Society of Arts. He is a Fellow of the Royal and Linnean societies. [*See* SUPPLEMENT.]

HENSLOW, REV. JOHN STEVENS, M.A., Professor of Botany in the University of Cambridge, was educated for the clerical profession in the University of Cambridge, and was a student of St. John's College: he graduated B.A. in 1818. He took holy orders, and, after officiating in the West of England, he was presented to the rectory of Hitcham in 1837, in which parish he still resides. He was appointed Professor of Mineralogy in the University of Cambridge in 1822, but resigned it in 1823: he was appointed to the chair of Botany in 1825. Although known as a botanist Professor Henslow has devoted himself very successfully to the observation of facts throughout the whole field of natural history science. One of his earliest scientific papers was on the subject of 'The Deluge,' and was published in the 'Annals of Philosophy' for 1824. In the first volume of the 'Transactions' of the Cambridge Philosophical Society, he published a geological description of Anglesea. He also published a paper in 1822 in the 'Transactions' of the Geological Society, entitled 'Supplementary Observations to Dr. Berger's account of the Isle of Man.' His name is also indissolubly connected with the discovery of the so-called coprolites of the Red Crag on the Suffolk coast. Professor Henslow had often observed peculiar nodules amongst the red crag deposits of Suffolk, and had carried them to a chemical friend in London, it turned out that they possessed from 60 to 90 per cent of phosphate of lime. [PHOSPHATITE, NAT. HIST. DIV., ENG. CYC.] Although at first Professor Henslow was inclined to regard these bodies as true coprolites, there is good reason to believe that they are not coprolitic in their origin at all. His papers on the subject of this discovery are as follows:—'On Nodules apparently Coprolitic, from the Red Crag, London Flag, and Green Sand,' published in the 'Reports' of the British Association for 1845; a second paper also appeared in the same Transactions in 1847, entitled 'On Detritus derived from the London Clay and deposited in the Red Crag;' in the first volume of the 'Journal of the Geological Society,' 'On Concretions of the Red Crag at Felixstow, Suffolk;' in the 'Gardeners' Chronicle' for 1843, 'On Fossil Phosphates,' and in the same journal in 1857, 'On the Phosphate nodules of Felixstow in Suffolk.'

Professor Henslow's papers and publications on the subject of botany have not been numerous, but most of them are of great value. One of the most valuable manuals in the language at the time of its publication was his 'Principles of Descriptive and Physiological Botany,' in 'Lardner's Cabinet Cyclopædia.' This work was published in the year 1835. He also published in the same year a catalogue of British plants. His other botanical papers are scattered amongst the transactions of learned societies and the natural history journals. He has given much attention to the application of the principles of botany to agriculture and gardening. He has also introduced the study of botany with great success into the village school of Hitcham. The management of this school, and the success of a village horticulturist society under his management, have occasionally drawn towards the village of Hitcham a large share of attention, and perhaps there are few parishes in the kingdom in which the influence of the special intellectual character of the clergyman has been so largely and beneficially felt.

The county of Suffolk has always found in Professor Henslow a firm friend of the advancement and diffusion of natural knowledge. He was one of the earliest of the friends of the movement which resulted in the establishment of the Museum of Natural History at Ipswich, and on the death of the Rev. W. Kirby, the first president of that institution, he was unanimously chosen to succeed him. The arrangements of this museum have been made entirely under the direction of Professor Henslow. The excellent way in which typical objects are presented for instructing in the great branches of natural history, has been carried out at his suggestion, and gives to this museum a special educational character. Professor Henslow's lectures for popular instruction delivered at this institution, have been quite models of the way in which information on natural history subjects should be conveyed. Of the manner in which such information may benefit the farmer, Professor Henslow has given indications in his papers on Smut and Brand, and on the Wheat Midge in the 'Journal of the Royal Agricultural Society of England.'

In the University of Cambridge Professor Henslow has ever been the advocate of progress. To his efforts, aided by those of others, may be attributed the establishment of the Natural History Tripos in 1848. This instalment of reform serves to some extent to do away with the anomaly of professors with chairs, on whose lectures no attendance is required of the pupil, and no knowledge of the subject in his examination. Professor Henslow is a member of the Senate of the University of London, and examiner in the science of botany; he is also a fellow of the Linnean Society and of the Cambridge Philosophical Society. [*See* SUPPLEMENT.]

HERAPATH, WILLIAM, a distinguished living chemist, was born on the 26th of May 1796, at Bristol, where his father was a maltster and brewer. When very young he manifested a taste for science, and was known in his family as 'the little philosopher.' He received his early education at a school in Bristol kept by Mr. Pocock, who is known from his having patented a kite-carriage, of which nothing was heard after the invention of railways. Young Herapath on leaving school was first placed with his father, but afterwards in a banking house. His father was however killed by an accident, and he was called at an early age to conduct his father's business. He now found that he had leisure to the study of chemistry, and obtained to great a reputation for his skill that he began to be consulted as a professional chemist. His first paper on chemical subjects was one in the Philosophical Magazine 'On the Specific Gravity of the Metallic Oxides.' He was one of the first British chemists who detected cadmium in the ores of this country. His reputation as a chemist increasing, he abandoned his malting in 1830, and devoted himself entirely to chemistry. He now took up the subject of toxicology, and having been successful in the demonstration of the existence of poison in a body that had been interred upwards of fourteen months, his reputation as a toxicologist became established. Since that time he has been employed very extensively on trials where the lives of human beings are dependent on the chemical evidence of guilt.

Mr. Herapath was one of the founders of the Bristol Medical School, in which he was the first teacher of chemistry, a position which he still occupies, and few provincial medical schools can boast of more efficient chemical teaching.

Mr. Herapath is well known in Bristol for his liberal politics. He was President of the Bristol Political Union previous to and at the passing of the Reform Bill. On the passing of the Municipal Reform Bill he was placed on the town council, and subsequently placed on the bench of magistrates, and made a charity trustee. He is a capital instance of the energy and capabilities of the middle classes of this country, having by his unaided efforts obtained a foremost position as a man of science and a citizen. [*See* SUPPLEMENT.]

* HORSFIELD, THOMAS, M.D., a distinguished traveller and naturalist. He went out to Java in 1802, and after having thoroughly investigated the natural history of that country, he returned to England in 1819 with a large collection of plants and animals. His herbarium of plants, which consisted of upwards of two thousand specimens, he committed to the care of Mr. Robert Brown, of the British Museum. In the meantime he devoted himself to the description of the animals, more especially mammalia and birds, which he had brought from Java, and whose habits and localities he had accurately observed. The result of these labours was the publication in parts, commencing in 1821 and terminating in 1824, of a quarto volume containing coloured illustrations, entitled 'Zoological Researches in Java and the neighbouring Islands.' Some time after the publication of this work, descriptions and figures of the plants collected by Dr. Horsfield were published with the title 'Plantæ Javanicæ rariores descriptæ iconibusque illustratæ, quas in insula Java, annis 1802-1817, legit et investigavit, Thom. Horsfield, &c. This work is one of the most valuable contributions to the exotic flora of the world that has hitherto been published in this country. In the latter part of the work Mr. Robert Brown was assisted by Mr. J. J. Bennett.

Dr. Horsfield first went to Java under the auspices of the Dutch Colonial Government. He remained in that country during its temporary occupation by the East India Company from 1811 to 1817, and was greatly assisted in his labours by this body. Dr. Horsfield now holds the position of superintendent of the natural history collections of the East India Company in London. This has given him considerable opportunities of exercising his great zoological knowledge, and he has contributed a large number of papers to the 'Transactions' of the Linnean and Zoological Societies. He is now engaged in publishing a Catalogue of the collections of the East India Company. In 1823 he published a 'Catalogue of the Lepidopterous Insects contained in the Museum of the Hon. East India Company.' In 1822 he published a 'Catalogue of the Birds in the Museum of the Hon. East India Company.'

Dr. Horsfield was elected a Fellow of the Royal Society in 1828, and he is one of the Vice-Presidents of the Linnean Society.

* HULLAH, JOHN, an eminent composer and popular musical instructor, was born in 1812, at Worcester, but his life, since childhood, has been spent in London. His early musical education was slight and desultory; it was not till he was seventeen that he received regular

Digitized by Google

instructions from Mr. Horsley, whose pupil he remained for three years; and he then entered the Royal Academy of Music. In 1836 he first became known to the public as a composer, by writing, in conjunction with Mr. Charles Dickens, the comic opera of 'The Village Coquettes,' which was produced at the St. James's Theatre then under the management of Mr. Braham, and performed more than fifty times during the season. In 1837 and 1838 he produced two other operas, 'The Barbers of Bassora' (written by Morton), and 'The Outpost' (written by Serle); both at Covent Garden, then under the management of Mr. Macready. Both were favourably received; but the run of the last was cut short by the appearance in it of a principal performer (whose name it is not necessary to mention) in a state of such intoxication that he was hissed off the stage. At this time Mr. Hullah's attention was turned from dramatic music to the pursuit in which he has so highly distinguished himself. He was led to contemplate the formation of popular singing classes, similar to those established in Paris; and, after several visits to that city for the purpose of examining and adapting to English use the celebrated system of Wilhem, he set on foot in 1840, and under the sanction of the Committee of Council on Education, schools in London founded on the principles of that system. The rapid growth of those schools, their diffusion into every part of the United Kingdom, and their immense influence in spreading the love and knowledge of vocal music throughout the population of this country, are well known to the public. It is proper to mention that, though Mr. Hullah in the establishment of his schools, received great assistance from individuals holding high official positions in connexion with the Committee of the Privy Council, the government has never contributed any pecuniary aid to their support; their expenses having been defrayed, partly from small payments made by the pupils themselves, partly by a subscription raised at the outset among a few distinguished friends of elementary education. The schools were at first held at Exeter Hall; but the heavy rent and other expenses having rendered it necessary to resort to a smaller and less convenient locality, Mr. Hullah conceived the design of erecting a building for the special accommodation of his classes. To this design we owe St. Martin's Hall in Long-acre, a spacious, handsome, and useful edifice, erected and fitted up by Mr. Hullah entirely by his own exertions and from his own resources. The foundation-stone of the building was laid in June 1847, and the whole was completed in December 1853. Since that time, public concerts, chiefly of great choral works, have been given there without interruption at the rate of about twelve yearly; the instrumental orchestra consisting of professional performers, and the chorus exclusively of amateurs all his own pupils. These concerts are of the highest order, and warmly supported by the public. From the year 1841, Mr. Hullah had every year opened classes for instruction in vocal music. Before the fire at St. Martin's Hall, in 1860, he opened his 170th class. At an average of sixty (which is below the mark), this makes upwards of 10,000 persons taught in these schools alone. But all these form a mere fraction, compared with the numbers taught in schools, great and small, throughout the United Kingdom and in the colonies, the statistics of which it would be impossible to collect. In fine, it may be safely affirmed that no individual has ever contributed so largely as Mr. Hullah has done, towards the diffusion of a taste for, and knowledge of Music, in its most wholesome form, among the people of this country.

* HUXLEY, THOMAS HENRY, a distinguished naturalist, was educated for the medical profession at one of the London hospitals, but his taste leading him to the study of natural history, he became an assistant surgeon in the Royal Navy, and sailed in the Rattlesnake with Captain Stanley. This expedition visited the coasts of Australia, and after having been out between two and three years returned to England. During the time of his absence from England, Mr. Huxley sent several communications on the natural history of the seas in which he was sailing, more particularly on the structure of the various forms of jelly fishes, to the Linnean Society. On his return, he more fully elaborated his researches on this remarkable family of animals, and communicated a paper to the Royal Society, entitled 'On the Anatomy and the Affinities of the Family of the Medusæ.' This was published in the Philosophical Transactions in 1849. These papers contain however only a part of the materials collected by this industrious observer, and he has now (1857) a large work with illustrations ready for the press, entitled 'A History of the Oceanic Hydrozoa.' His researches upon the Medusæ have tended to throw much light on the structure of those least known to British observers, and have confirmed the views of those systematic writers who had previously regarded these animals as closely allied to the great family of polypes, amongst the Radiate class of animals.

Mr. Huxley has also successfully investigated the great family of Molluscs, and in a paper, also published in the 'Philosophical Transactions,' on the 'Common Plan, or Archetype of the Molluscs,' he showed that as the annulose and vertebrate animals had a common type or plan, so also had the Molluscs. His views on this subject were subsequently developed in a more popular form, in the article 'Mollusca,' published in the Natural History Division of this Cyclopædia. Besides these papers, he has published several on various departments of Zoology and Comparative Anatomy in the 'Annals and Magazine of Natural History,' and in the 'Quarterly Journal of Microscopical Science.' On the resignation of Professor Edward Forbes, Mr. Huxley was appointed Professor of Palæontology in the Government School of Mines. In connection with this chair Professor Huxley delivers every year a course of lectures on General Natural History. The consecutive reports of some of these series which appeared in the 'Medical Times and Gazette,' and also various lectures delivered by him to mixed audiences, did much to explain and popularise his views on the broader questions of natural history and physiology, as well as to enhance Mr. Huxley's reputation as a comparative anatomist. He has delivered several evening lectures at the Royal Institution of Great Britain, and is at the present time Fullerian professor of Physiology in that institution. He has published 'Man's Place in Nature,' 1863, and 'Elementary Physiology,' 1866.

* JULIEN, STANISLAS-AIGNAN, a Chinese scholar of the highest eminence, was born at Orleans on the 20th of September 1799, the son of Noel Julien a noted mechanician of that city. He was singularly unfortunate in his earlier years, at the age of four he lost his father, and the re-marriage of his mother gave him a step-father, who set his face so decidedly against the boy's receiving a superior education that it was only by stealth that, with his mother's connivance, he obtained some lessons in Latin. On the death of the step-father he was sent to the college of Orleans, but the death of his mother threw him into the hands of a guardian, who determined, in spite of his inclinations, to make him an ecclesiastic, and sent him to the 'seminary;' a place of education for young priests, and to this time he had a strong desire to become acquainted with Greek, and at that language did not enter into the plan of studies at the seminary, he learned it by stealth, by himself; but on its being discovered that he had done so, his extraordinary application extorted the approval of his superiors, and he was even appointed to teach Greek to the other scholars. He then taught himself to read English, Italian, Spanish, Portuguese, and German. He had made up his mind to emigrate to Camden, in South Carolina, where an elder brother had succeeded in establishing a manufactory of fire-arms, when news of the death of his brother arrived and retained him in France. In 1821 he went to Paris, with the ambition of distinguishing himself as a Grecian, and prepared an edition of Coluthus's poem of the 'Rape of Helen,' to effect the publication of which, he had to sell the last house that remained to him of his patrimony at Orleans. A young Scotchman, named John Wilson, with whom he became acquainted at Paris, inspired him with a passion for the Oriental languages, and fortunately introduced him to the patronage of Sir William Drummond, the author of 'Origines,' who supplied him with sufficient funds to enable him to devote himself for a short time to the study of Chinese.

The study of that language was then in a transition state. From the time of Louis XIV., the French had decidedly taken the lead in introducing a knowledge of Chinese history, science, and literature into Europe, but the numerous works of value on the subject which their missionaries had given to the world in the course of the 18th century, were rather calculated to convey a knowledge of results, to be received on the credit of the writers, than to enable others to test those results and to pursue researches. They had published many volumes of memoirs and dissertations, but no dictionary, and the grammar of Fourmont was an imposture. The dictionary of Father Basil of Glemona, which was issued at the expense of Napoleon I., in the early part of the present century was eclipsed and effaced by the far superior work of the English missionary, Dr. Morrison, which still remains the best and leading Chinese dictionary for all Europe. At the same time a few close translations by English missionaries, which showed that their French predecessors had taken extensive liberties with the originals, roused a general anticipation that for the future the French would have not only rivals, but superiors in the field which had hitherto been their own.

These anticipations were not destined to be fulfilled, at least in the earlier half of the 19th century. The establishment of an endowed Professorship of Chinese at the College of France in 1815, on the recommendation of Silvestre de Sacy, proved in its results a very important step. The first professor, Abel Rémusat, had just issued a Chinese grammar of singular and sterling merit at the time that Julien began to attend his lectures. Julien was from the first so captivated with Chinese, that he at once gave his whole time and attention to the study, and his progress was marvellous. In the second month he commenced a translation of the last of the 'Four Books,' which may be called the leading sacred classics of China—a work recording the conversations of Mang Tsze, or Mencius, the philosopher highest in reputation among his countrymen after Confucius. Six months afterwards he presented the work complete to the Asiatic Society of Paris, which resolved on printing it at its expense, and at the same time, the Count de Lasteyrie offered to lithograph the original, which was published in conjunction. The book thus commenced in 1824, was completed in 1830, and is one of the most valuable aids that can be placed in the hands of a student of Chinese. The previous translation of Mencius by Father Noel is so vague that it affords scarcely any assistance towards reading the original; in that of Julien every word of Chinese is rigidly rendered into Latin, a perpetual commentary is added, drawn from Chinese sources, and copious notes are inserted for the explanation of

Digitized by Google

difficulties in construction. Though, as might be expected, the author has committed some errors in this first production, which he has since acknowledged, it is, taken on the whole, one of the most wonderful achievements in the annals of scholarship. It is scarcely less wonderful that the ardour of which it was a proof, appears scarcely to have slackened for the following three-and-thirty years. From the date of the publication of 'Mencius' to the present year, a third of a century, M. Julien may be safely said to have passed "no day without a line" of Chinese. Though the aid of Sir William Drummond soon ceased, his talents found other patronage. His future was secured by his appointment to the sub-librarianship of the Institute, and some years after he was named one of the conservators of the unequalled royal, now imperial library, by which the Chinese books, which in that library are, though printed, technically regarded as manuscripts, were placed under his management. The collection, which at his nomination comprised about twelve thousand volumes, has considerably increased under his superintendence. In 1832, on the death of Rémusat, he was unanimously recommended to the vacant Professorship of Chinese at the College of France, and it is generally acknowledged, that if in literary and philosophical talent, he does not equal his brilliant predecessor, who adorned whatever he touched, yet he may be considered even a profounder scholar and a safer guide through the intricacies of Chinese. Among his own pupils are eminent names: Theodore Pavie, the traveller in America and Asia, and translator from Chinese and Sanscrit; Biot, the younger, son of the astronomer, whose early death was a heavy loss to both literature and science; and Bazin, now professor of modern Chinese, who has always given his chief attention to that form of the language. These pupils, in conjunction with their teacher, have for many years past restored to France the supremacy in Chinese literature, which she once seemed likely to lose. In England, it is almost impossible to pass a grocer's shop without seeing a Chinese inscription; in the streets of the metropolis Chinese passengers and Chinese beggars are of daily occurrence; hundreds of thousands of Chinese emigrants live under the British flag; our transactions, both of war and peace, with the population of from three to four hundred millions which uses the Chinese character, are of the most important kind; but the study of that language seems to be still regarded as an object of no interest, except to a few missionaries, and the cultivation of its literature is left in London to the care of one professor, with a salary of, we believe, twenty pounds a year.

M. Julien's publications, which are numerous, all bear on the subject of his favourite language, with the exception of a few translations from modern Greek, and one from English, the new system of teaching writing introduced by Carstairs, of which he is a warm advocate. He has translated two Chinese plays, the 'Hwuy-lan-ke,' or 'Circle of Chalk,' of which the original was lithographed in the 'Chrestomathie Chinoise,' published by the Asiatic Society of Paris, and the 'Chaou-che-kou-urh,' or 'Orphan of the House of Chaou,' a previous translation of which by Father Prémare was the foundation of a tragedy by Voltaire, which, rendered into English by Murphy, under the title of 'The Orphan of China,' presents the only dramatic story common to the Chinese and English stage. Prémare had, in his version, omitted the verses which are interspersed in the original as too obscure and difficult; Julien has rendered them all. A version of a Chinese novel, of which the original was first published about 1807, and the translation in 1834, 'Pih-chay-tsing-ke,' 'White and Blue, or the Two Fairy Snakes,' appears to have met with little success. An edition to which is full of Buddhist superstitions, is much less suited to European taste than those of the earlier translated novels, 'The Fortunate Union,' and 'The Two Fair Cousins,' which are strikingly modern in tone, though the composition of one of them is ascribed to the 15th century. A 'Summary of the principal Chinese treatises on the cultivation of Mulberries and the management of Silk-worms,' which was made into French at the desire of the French Minister of Agriculture and Commerce, has been translated into several languages, and an English version has appeared in the United States. 'Kan-ying-peen,' or the 'Book of Recompences and Punishments,' which, though in French, is one of the publications of the Oriental Fund of London, is a religious book of the sect of the Taou-Sze, said to amount to about 100 millions in number, who follow the doctrines of Laou-Tsze, a contemporary of Confucius, whose book of doctrine of Laou-Tsze himself, 'Taou-tih-king,' or the 'Book of the Way and of Virtue,' was translated and published in 1841, with an extensive commentary, and accompanied by the original. Perhaps the most important work that M. Julien has yet issued is his last, the 'Voyages des Pèlerins Bouddhistes,' or 'Travels of Buddhist Pilgrims,' of which the first volume appeared in 1853, and the second in 1857. The first volume comprises a history of the life of Heuen-Tsang, a Chinese Buddhist, and of his travels in India from A.D. 629 to A.D. 645; the second, information on the countries west of China, rendered from the Sanscrit into Chinese by Heuen-Tsang, and from Chinese into French by M. Julien. To translate these volumes, which abound in phrases foreign to Chinese, required not only an accurate knowledge of that language, but also some acquaintance with Sanscrit and Pali, and the preliminary studies which were necessary for the due execution of the task spread over a period of twenty years. The work throws an unexpected light on the early history and geography of India, and some of the expense of its preparation and publication was defrayed by the English East India Company.

In addition to these various labours M. Julien is the writer of three controversial pamphlets of some extent, in which he criticises with much severity the mistakes and short-comings of M. Pauthier, a Chinese scholar, who published defective translations of portions of Laou-Tsze and Heuen-Tsang. In these pamphlets much light is incidentally thrown on various questions of Chinese grammar. He has also contributed a long series of articles to the Parisian 'Journal Asiatique,' of which he has for some years been one of the editors. One of the most interesting of these is on the origin and progress of printing in China. The invention of printing by blocks, each containing a page, has been attributed not only by Kiaproth, but by several Chinese writers, to a certain Fung-tsou about the date of A.D. 932; but M. Julien refers to passages in Chinese encyclopædias, in which the process is mentioned as in use in A.D. 593, and is said to have been discovered about A.D. 581. He also quotes a remarkable passage, in which a certain Pe-shing, a smith, is said to have invented, between A.D. 1041 and 1049, a process for setting up pages with moveable Chinese characters, which afterwards fell into disuse, as, from the peculiar character of the Chinese language, the earlier practice of printing in whole pages, a species of stereotype, was found more convenient. M. Julien adds however that, when in 1773 the Emperor Keen-lung issued a decree for the publication of a very large collection of the Chinese standard works, a member of the ministry of finance, Kin-kwen, suggested that in order to avoid the expense of keeping in store the immense quantity of blocks that would be required, the old moveable type system should be revived, and that, in 1776 the emperor approved of the proposal, which was accordingly acted upon. The whole of this latter statements are very interesting, but the reader cannot help suspecting some errors in the details, when he notices the extraordinary extent which is attributed by three of the most learned scholars of the century to the collection of Chinese standard works referred to as published by order of Keen-lung. In the article on printing, M. Julien describes this collection as extending to 10,412 distinct works. In a lecture on Chinese literature, Rémusat states distinctly that "the emperor ordered the publication of a *select* collection (*collection choisie*) in 180,000 volumes." Professor Neumann of Munich reduces the number, but only to 160,000, and M. Julien, in his preface to his work on the Mulberry and Silk-worm, adopts the same number as of the entire work, and states that, "in 1818, there had already appeared 78,627 volumes of this vast collection." It is certainly remarkable that three such men should have set forth statements so extraordinary, apparently without having suspected that for *volumes* they should have read *books* in the sense of chapters.

* LIVINGSTONE, DAVID, LL.D., D.C.L., and Fellow of the Faculty of Physicians and Surgeons, Glasgow. Under the head MOFFAT, ROBERT, a notice has been given of Dr. Livingstone, which agrees in substance with the brief account which he has himself given of his early life in the Introduction to his recently-published volume entitled 'Missionary Travels and Researches in South Africa, including a Sketch of Sixteen Years' Residence in the Interior of Africa, and a Journey from the Cape of Good Hope to Loanda on the West Coast; thence across the Continent, down the river Zambesi, to the Eastern Ocean,' 8vo, London, 1857, with Maps and Illustrations. In addition to the brief notice of Dr. Livingstone already given under MOFFAT, a few facts may be here stated.

Dr. Livingstone's great-grandfather was a native of the Highlands of Scotland, and fell at the battle of Culloden, fighting for the Stuart line of princes. His grandfather was a small farmer in Ulva, one of the Western Islands of Scotland, and there his father was born. Finding the farm in Ulva insufficient for the support of a numerous family, the grandfather removed to the Blantyre Works, a large cotton manufactory on the Clyde, near Glasgow, where the sons received employment as clerks, and himself as a confidential messenger. The father brought up his children in connection with the Kirk of Scotland, but afterwards left it, and during the last twenty years of his life held the office of deacon of an independent church in Hamilton. He died in February 1856, when his son had passed Zumbo on his journey to the eastern coast of Africa.

David Livingstone, when ten years of age, was placed in the cotton-factory as 'a piecer.' While in this situation, though the day's labour was from six o'clock in the morning till eight in the evening, he learned Latin, and at the age of sixteen was well acquainted with Horace, Virgil, and other classical authors. He also read with eagerness scientific works and books of travels, not only studying at night, but by placing his book on a portion of the spinning-jenny, he could catch sentences after sentence as he passed at his work. In his nineteenth year he was promoted to the toil of cotton-spinning, which, being then of a slender form, he felt very severe, but was well paid for. He had become desirous of going out to China as a medical missionary, and the remuneration which he received for his labour enabled him to support himself while attending medical and Greek classes in Glasgow in the winter, and the divinity lectures of Dr. Wardlaw in the summer. In due time he was admitted a Licentiate of the Faculty of Physicians

Digitized by Google

at Glasgow. Having joined the London Missionary Society, he was now qualified for a medical missionary in China, but the war with that country was then in activity, and under the circumstances it was deemed better that he should go to South Africa, where Mr. Moffat had opened an inviting field for missionary labour. After a more extended theological training in England than he had enjoyed in Glasgow, he embarked for Africa in 1840, and in three months reached Cape Town. Going round to Algoa Bay, he proceeded thence to the interior, where he spent the following sixteen years of his life.

After residing some time at the principal missionary station at Kuruman and other places, and studying the language and manners of that section of the Bechuanas called Bakwains, he selected the beautiful valley of Mabotes (25° 14′ S. lat., 26° 30′ E. long.), as the site of a missionary station, and thither he removed in 1843. While residing there he went out on one occasion with a party of the natives for the purpose of shooting one or two of a troop of lions, which leaping into the cattle-pens by night, destroyed the cows, and even attacked the herds in open day. If only one of the lions were killed, it was expected that the troop would leave the locality. The natives surrounded the lions while they were sitting on a hill, but allowed them to break through and escape. Livingstone however, seeing one of them sitting behind a bush on a piece of rock, at a distance of about thirty yards, took a good aim, and fired both barrels of his gun into the bush. He was uncertain whether the lion was struck or not, and was in the act of reloading his gun when the lion sprung upon him, caught his shoulder, and they both came to the ground together, the lion having one of his paws on the back of Livingstone's head. One of the natives, at a distance of ten or fifteen yards, taking aim, shot both barrels missing fire, the lion sprung upon the native, and bit his thigh. Another native then attempted to spear the lion, which then caught this man by the shoulder, but at that moment the two bullets fired by Livingstone took effect, and the lion fell down dead. Besides crushing the bone into splinters, he left eleven teeth-wounds in the upper part of Livingstone's arm. The consequence has been that he has a false joint at the shoulder, which has ever since prevented him from taking a steady aim.

Dr. Livingstone resided among the Bakwains, mostly at the station which was called Kolobeng from a stream of that name, on the banks of which it was situated. On the 1st of June 1849, Dr. Livingstone, in company with Messrs. Oswell and Murray, two gentlemen who had come from the East Indies for the purpose of hunting, started from Kolobeng for the purpose of discovering the Lake Ngami. This purpose was accomplished on the 1st of August. In June 1851, Dr. Livingstone discovered the Zambesi flowing in the centre of the northern part of the continent of South Africa. In April 1852 he returned to Cape Town, with Mrs. Livingstone and his children, for the purpose of sending them to England, while he himself, in order to seek a more healthy locality for a station, where he should also be free from the annoyances to which he had been some time subjected by the Boers of the Caaban Mountains. Having sent his family home to England, Dr. Livingstone, in the beginning of June 1852, commenced his last journey from Cape Town. While detained at Kuruman he received intelligence of Pretorius, the Dutch revolutionary leader, having sent 400 Boers to attack the Bakwains at Kolobeng. They burnt down the village, killed about sixty men, and carried away many of their women and about 200 of the school-children for slaves. Dr. Livingstone's house was plundered of everything, his books torn to pieces and scattered about, and all the property in the village taken away. Having returned to Kolobeng, and remained a few days with the wretched Bakwains, he prepared to depart northwards on the 15th of January 1853, and on the 23rd of May arrived at Linyanti (18° 17′ 20″ S. lat., 23° 50′ 9″ E. long.), the capital of the great tribe called Makololo. The chief, named Sekeletu, and the whole of the population of the town, numbering between 6000 and 7000, received him with enthusiastic kindness.

On the 11th of November, 1853, Dr. Livingstone took his departure from Linyanti, for the western coast of Africa, accompanied by twenty-seven natives belonging to the tribe of Makololo. The journey was performed partly by land, and partly by water in canoes. They ascended the Leeambye till they reached the confluent the Leeba, coming from the N.N.W., which they also ascended for some distance, and then travelled overland till they reached the Lake Dilolo. Thence, with much difficulty and frequent danger from hostile natives, they proceeded till they reached the Coango (Quango), which they crossed, and were then protected by the Portuguese, and treated with much kindness, till they reached Loango, the capital of Angola, on the western coast of Africa. At Loango Dr. Livingstone and his party were received by Mr. Gabriel, the British commissioner for the suppression of the slave-trade, and treated with the most liberal hospitality, and were also treated with kindness by the Portuguese authorities. They remained at Loango till September 20, 1854, when they started on their return journey to Linyanti, which they reached in September 1855.

On the 3rd of November 1855, Dr. Livingstone started, in company with a number of natives, on his journey to the eastern coast of Africa. After passing over the Victoria Falls the Leeambye takes the name of the Zambesi, both names having the same meaning, namely 'river.' Following the course of the Zambesi, sometimes on the northern bank and sometimes at a short distance from it, they proceeded to some distance below Zumbo, where a native chief lent them some canoes, by which they were enabled to cross to the southern side. On the 3rd of March 1856, they reached the Portuguese station at Tete, which they left on the 22nd of March, and, sailing down the Zambesi, on the 27th arrived at Senna. Thence Dr. Livingstone proceeded to Kilimane, at the mouth of the river, and her Majesty's gunbrig Frolic having arrived there, Dr. Livingstone was received on board. The Frolic left Kilimane July 12, and arrived at Mauritius August 12, where Dr. Livingstone remained till November, when he returned by the Red Sea and the Overland route, and on the 12th of December 1856, was in England. Dr. Livingstone hopes to establish a trade with the interior of Africa by means of the great river Zambesi, and the British government have decided upon granting a sum of £5000 in order to defray the cost of an expedition up that river. A ship of the proper construction, drawing a small quantity of water, is now (December 1857) ready, and if the voyage is to be made next year, she must leave this country in January, so as to be at the mouth of the Zambesi in March; otherwise the expedition must be deferred till the following year. [*See* SUPPLEMENT.]

* MAURY, MATTHEW FONTAINE, LL.D., Lieutenant in the United States navy, Superintendent of the Naval Observatory and Hydrographical Office at Washington, was born on the 14th of January 1806, in Spottsylvania County, Virginia, but educated in Tennessee, whither his parents removed while he was very young. Having entered the United States navy, he, in 1824, received a commission as midshipman on board the Brandywine. He continued with this vessel during a voyage to Europe and a cruise in the Pacific Ocean. Afterwards, it is stated in Duyckinck's 'Cyclopædia of American Literature,' he served in the Vincennes sloop, on board of which he made a voyage round the globe, which occupied nearly four years. This statement is also made in connection with Commander Wilkes's 'Narrative of the United States Exploring Expedition,' published by the United States government, though the name of a Lieutenant Maury occurs in the list of the crew of the Vincennes, it is William L. and not Matthew F. Maury, and no other person of the name of Maury is on the list of the crew of either of the ships. Commodore Wilkes seems expressly to state that his was the *first* exploring expedition made by order of the United States government, so that Mr. Maury could not have sailed in a previous voyage, while a circumstance stated in Duyckinck, would, if the date be correct, prove (apart even from the discrepancy of the Christian names) that he did not sail in this or any subsequent voyage—namely, that in 1839 he had the misfortune to have his leg broken by a fall from a horse, and being thus rendered lame, was incapacitated for further service afloat: the voyage of the Vincennes under Commodore Wilkes occupied from 1838 to 1842. Mr. Maury served for awhile as master of the Falmouth, stationed in the Pacific, from which he was removed to the frigate Potomac as acting lieutenant; and soon after, having by this time established his character as a scientific seaman, he was appointed on his return to New York to accompany an exploratory expedition under Captain Jones as director of the astronomical observations, with the rank of lieutenant. Before the expedition sailed he resigned the appointment at the same time with Captain Jones. Shortly after he was appointed to the charge of the depôt of naval charts and instruments at Washington. Under his direction the depôt of naval charts soon assumed an important character. It was re-organised, the plan enlarged, and named the National Observatory; but it having become more and more exclusively a branch of the naval service, its title was in 1855 changed to that of the Naval Observatory. Whilst at sea, Mr. Maury had written a valuable work for the use of mariners, entitled 'A New Theoretical and Practical Treatise on Navigation,' in which he treated at length of the mathematical sciences, as far as they bore on navigation, with theoretical and empirical methods of working out the various problems of the navigator, as well as embodied the results of his own observation and experience. The work was not of service to others only: the composition of it had compelled him not merely to master more thoroughly the higher branches of mathematics, but it had led him to look steadily at the still unfulfilled desiderata of the mariner, which his self-training had fitted him at once to comprehend clearly and emboldened him to endeavour to supply.

His appointment as superintendent of the National Observatory at Washington, and of the government Hydrographical Office, enabled him to give a most important practical direction to his previous investigations. His attention had been strongly directed to the subject of ocean currents and the Gulf Stream, and he saw how much more precision might be given to our knowledge respecting them by an extended system of well-directed simultaneous observations. In 1842 he submitted to the chief of the Bureau of Ordnance and Hydrography a scheme for the making of daily observations at fixed hours by the commanders of the naval and merchant service of the United States when at sea. The scheme was adopted; and masters of vessels were supplied with model logs, according to which they were to enter the direction of the wind at least once in every eight hours; the direction, velocity, depths, and limits of the various currents; the temperature of the air, and at the same time that of the water at the surface, and as far as practicable at various depths of the sea; as well as such other

Digitized by Google

phenomena as might appear to bear on the main objects of enquiry. An 'Abstract Log' of these observations was to be deposited at the observatory at the end of each voyage. In the case of whalers, the limits within which the "right whale" (or that which is the special object of the whaler's search) was seen was to be carefully indicated. In his report drawn up after nine years' experience, Lieutenant Maury stated that abstract logs were made from 200 large manuscript volumes, averaging each from 2000 to 3000 days' observations, had been collected, examined by a staff of officers selected for the purpose, and the results tabulated. As soon as sufficient materials were obtained, Lieutenant Maury issued a series of Wind and Current Charts of the Atlantic Ocean, which were continually corrected and extended as fresh matter was collected.

As early as April 1844 he stated the result at which he had arrived respecting the Gulf Stream, ocean currents, and great circle sailing, in a paper which he read before the National Institute, and which, under the title of 'A Scheme for Rebuilding Southern Commerce,' was printed in the 'Southern Literary Messenger' for July of that year. But he published the full development of his views in the 'Explanations and Sailing Directions to accompany the Wind and Current Charts;' 'Notice to Mariners: being Routes to Ports in the Pacific, Indian, and South Atlantic Oceans,' 1850; and the 'Investigation of the Winds and Currents of the Sea,' printed in the Appendix to the 'Washington Astronomical Observations for 1846,' 1851. The vast importance of the 'Wind and Current Charts,' and of the 'Investigations, Explanations, and Sailing Directions,' has long been acknowledged by all authorities. For the man of science, they have gone far to remove previous errors of observation, and contradictory statements respecting the great oceanic currents, and laid a secure basis for the study of marine meteorology. But their practical and commercial benefits have been even more striking than the scientific. To the navigator they have been of incalculable value, not merely in showing him the importance of scientific observations, but in enabling him to avoid perilous tracts, and materially to shorten the passage at sea. It was stated by President Pierce in his message to Congress in 1855, that by means of the Charts and Directions "the passage from the Atlantic to the Pacific ports of the United States has been shortened by about forty days;" the passage between the American and English ports has also by the same means been very considerably shortened. For the whale-fisher it was found that there were immense belts of ocean from which by physical causes the "right whale" was entirely excluded, and the true fishing ground was very clearly indicated. Again, the systematic prosecution of deep-sea soundings, led, among other things, to the discovery of what has been called the 'telegraphic plateau,' the existence of which has rendered practicable an electric telegraph between England and America.

Following up his labours at home, Lieutenant Maury, when the results of the system of regular marine observations, which he had organised, had placed their value beyond question, sought to render the investigation as universal as possible by means of a general scheme of international co-operation. With this view, having secured the cordial assistance of the Royal Society of London, he, with the sanction of his government, applied in the first instance to the British Admiralty, and happily succeeded in inducing the British government to direct that corresponding observations should be made by British ships of war, and recommending the same to the Merchant service. The example and influence of the British flag set maritime nations naturally to follow on the other maritime powers to promise their co-operation, and accordingly a congress was held at Brussels, in 1853, which was attended by Lieutenant Maury, at which a scheme was agreed to for a uniform system of daily observations at sea by the commanders of ships of all nations. The result of this conference may be given in the words of Dr. Lloyd, in his address as President to the British Association, August 1857:—"The Report of the Conference recommending the course to be pursued in a general system of marine meteorological observations was laid before the British Parliament soon after, and a sum of money was voted for the necessary expenditure. The British Association undertook to supply verified instruments by means of its Observatory at Kew; and the Royal Society, in consultation with the most eminent meteorologists of Europe and America, addressed an able report to the Board of Trade, in which the objects to be attended to, so as to render the system of observation most available for science, were clearly set forth. With this co-operation on the part of the two leading scientific societies, the establishment was soon organised. It was placed under the direction of a distinguished naval officer, Admiral Fitz Roy; and in the beginning of 1855 it was in operation. Agents were established at the principal ports for the supply of instruments, books, and instructions; and there are now more than 200 British ships so furnished, whose officers have undertaken to make and record the required observations, and to transmit them from time to time to the department. The observations are tabulated, by collecting together, in separate books, those of each month, corresponding to geographical spaces bounded by meridians and parallels 10 degrees apart. At the present time 700 months of logs have been received from nearly 100 merchant ships, and are in process of tabulation. Holland is taking similar steps; and the Meteorological Institute of that country, under the direction of Mr. Buys Ballot, has already published three volumes of nautical information, obtained from Dutch vessels in the Atlantic and Indian Oceans."

In 1855 Lieutenant Maury embodied in a popular form the results of his investigations on maritime geography and meteorology, in his 'Physical Geography of the Sea,' of which a second and enlarged edition was published in the same year. As an original scientific discoverer Lieutenant Maury is perhaps scarcely entitled to so high a place as his countrymen claim for him. His attainments are very extensive, but his great distinction lies in his faculty of systematising and rendering practically applicable other men's observations and discoveries. In his enquiries on the ocean currents and the gulf-stream, and in the construction of his charts, his course was plainly marked out for him by Rennell; and much that he has propounded on marine meteorology was laid down by Dove and others. But he has extended their discoveries and added others of his own, and he has examined the great field of investigation more thoroughly and seen its immense practical importance more clearly than any of his predecessors or contemporaries, and, what was of still greater consequence, he at once perceived and applied the best possible means of solving most readily and perfectly the remaining problems and rendering the results practicably available for the service of the navigation and the commerce of the world. A man of profounder scientific acquirements might have given a more learned aspect to his investigations, but only one endowed with the rare practical genius, industry, and energy—combined with the thorough knowledge of nautical matters—of Lieutenant Maury could have presented them in so clear and workable a form as at once to have satisfied the judgment of scientific men, removed the indifference of governments, and secured the cordial co-operation of navigators generally.

Besides the works already noticed Lieutenant Maury is the author of a series of 'Letters on the Amazon and the Atlantic slopes of South America;' 'Refraction and other Tables, prepared especially for the Reduction of Observations at the National Observatory, Washington;' 'On the probable Relation between Magnetism and the Circulation of the Atmosphere: Appendix to Washington Astronomical Observations, 1846' (1851); 'Astronomical Observations made at the National Observatory' (1853); and a 'Letter concerning Lanes for the Steamers crossing the Atlantic' (1854), in which he lays down a plan for the avoidance of collisions with Atlantic steamers by confining them to certain eastward and westward tracks or 'lanes,' which he shows by observations taken from log-books extending over 46,000 days, would afford at the same time the most direct as well as the safest routes. The official charts prepared by Lieutenant Maury at the Naval Observatory, and published by the Bureau of Ordnance and Hydrography at Washington, comprise: North and South Atlantic Track Charts (8 sheets each); North Pacific Track Charts (4 sheets), and South Pacific (2 sheets); North and South Atlantic and Cape Horn Pilot Charts (2 sheets each); North Pacific (2 sheets), and South Pacific Pilot Charts; Coast of Brazil Pilot Charts; Track-Wind Charts of the Atlantic; Whale Chart of the World (4 sheets); Thermal Charts of the North Atlantic (8 sheets); Storm and Rain Charts of the North Atlantic, &c.

MONK, DR. JAMES HENRY, Bishop of Gloucester and Bristol, was born in 1784, and received his early education at Norwich Grammar school and the Charter House. He subsequently entered at Trinity College, Cambridge, of which he became Fellow and Tutor. In 1808 he was chosen to succeed the celebrated Richard Porson as Regius professor of Greek in the university. It was mainly owing to his efforts that the present system of classical honours at Cambridge was established, and the Pitt press founded. As a scholar of Porson's school he is best known for his editions of Euripides and Hipppolytus of Euripides, and in the literary world for his 'Life of Bentley,' and the 'Adversaria' of Porson. He was appointed Dean of Peterborough in 1824, and consecrated bishop of Gloucester in 1830; the see of Bristol was added to his charge in 1836. He died June 6, 1856.

NEWTON, REV. JOHN, well known as a divine, and as the friend of the poet Cowper, was born in London July 24, 1725 (o.s.). His life was a very remarkable one. His father was the master of a ship in the Mediterranean trade, and at the age of eleven, young Newton (who so only school-education was from his eighth to his tenth year) accompanied his father to sea, and in the following years made several voyages, but with considerable intervals between them. From his mother he had derived religious instruction and example, but she died while he was very young, and he early fell into vicious habits. In his nineteenth year he was seized by a press-gang, and taken on board the Harwich ship-of-war. His father however procured him recommendations, and he was placed on the quarter-deck as a midshipman. Extreme carelessness at this time marked his conduct; he forfeited his captain's good opinion, and on the ship touching at Plymouth he deserted, having heard that his father was at Torbay. He was speedily captured, flogged, and degraded. Treated with contempt as well as harshness, his lot seemed almost insupportable, and on the application of an African trader off Madeira for assistance, he volunteered to go on board, and accordingly obtained his discharge. This ship he left on the African coast, and hired himself as a labourer on an estate on

Digitized by Google

the island of Benanocs, S.E. of Sierra Leone. During the fifteen months he remained here, he suffered dreadfully from sickness and ill treatment, but he was at length found by the captain of an African ship who had been commissioned by his father to make inquiries after him, and restored to his friends. His father however he did not see again: he had been appointed governor of York Fort in Hudson's Bay, where he died in 1759.

It was in May 1748 that young Newton returned to England. By this time his character had undergone a great change. His loneliness and sufferings in Africa had rendered him serious: a storm which occurred on his passage home, and during which the ship was in imminent peril, had deepened his seriousness into religious conviction. So high an opinion had his conduct on this voyage raised of his character and ability, that the owner of the vessel immediately offered him the command of another Guinea ship, but he declined the offer, preferring to serve at least another voyage as mate. He now devoted the whole of his leisure to self-improvement. Whilst in Africa he had one book—Euclid's Elements; and, drawing the diagrams on the sand with a stick, he had made himself master of the first six books; during this voyage he succeeded in teaching himself the rudiments of Latin, and the leisure hours of subsequent voyages enabled him to obtain considerable proficiency in that language, and to acquire much general information. All this time his religious impressions were deepening, and having escaped from many remarkable perils, he became convinced that he was the special object of a superintending providence. While mate he established and himself regularly conducted public worship twice every Sunday.

In all, Newton was captain of a Liverpool slave-ship about four years; and he confesses that "during all the time he was engaged in the slave-trade, he never had the least scruple as to its lawfulness; but an increasing dislike to the occupation led him, on being prevented by a serious illness from sailing (Aug. 1754) with his ship, to look about for another employment. Through the interest of a friend he obtained the post of surveyor in the port of Liverpool in August 1755. He now laid aside his Latin and mathematical studies, and devoted all his spare hours to become acquainted with the Scriptures in the original languages, and succeeded in acquiring some facility in Greek and Hebrew, and a slight knowledge of Syriac: he also read largely theological works in Latin, English, and French. Associating much with those who were strongly influenced by the religious movement originated by Wesley and Whitefield, Newton was led by his zeal and energy to take a prominent part in their meetings for prayer and mutual exhortation. His addresses proving unusually acceptable, he was encouraged to offer himself (Dec. 1758) as a candidate for holy orders, and a curacy was obtained for him. The Bishop of Chester readily countersigned his testimonials, but the Archbishop of York (Dr. Gilbert) refused his assent, "his grace being inflexible in supporting the rules and canons of the Church." The refusal in nowise abated Newton's zeal. To show how he would have preached had he been ordained, he published (1760) a volume of 'Six Discourses,' and in 1762 a series of 'Letters on Religion,' under the signatures of Omicron and Vigil, which had extensive popularity at the time, and have been very often reprinted. He now began to turn his thoughts to the ministry among the Dissenters, but several 'evangelical' clergymen urged him to make another effort to obtain episcopal ordination. He was presented to the curacy of Olney, and in April 1764 ordained by the Bishop of Lincoln. Much public attention was called to the affair, and he was a few months later induced by Lord Dartmouth to publish an 'Authentic Narrative of some Remarkable and Interesting Particulars in the Life of the Rev. John Newton,' which he had written shortly before.

Newton remained nearly sixteen years at Olney. The stipend of the curacy was only 30*l.* a year, but he had some means of his own, and, as Southey observes, "his zeal and his genius, aided by the remarkable story of his life, had rendered him a conspicuous personage in what is called the religious world." Mr. Thornton, a wealthy London merchant of similar opinions (whose name is well known from Cowper's Correspondence), wrote to him on his removal to Olney, "keep an open house for such as are worthy of entertainment: help the poor and needy," and added, "I will stated-ly allow you 200*l.* a year, and readily send whatever you may have occasion to draw for more." Thus supported, Mr. Newton was able to give effect alike to his zeal and his benevolence. He soon became the recognised leader of those, both lay and clerical, in that part of the country who participated in his views. It was in order to have the benefit of his ministry and friendship that Cowper, with Mrs. Unwin, removed to Olney. It may be doubted whether Newton's treatment of the poet's mental hallucination was the most judicious, but there can be no doubt of the kindness and purity of his intentions, or of the admiration and friendship with which he regarded the poet personally. The poet, as is well known, looked up to Newton with veneration as well as esteem. In all, Cowper spent more than twelve years in daily intercourse with Newton at Olney, and part of the time, during one of his terrible attacks of insanity, in Newton's house. Together they composed the 'Olney Hymns,' in which Cowper first appeared before the world as a poet, and when he published his first volume of poems, Cowper begged Newton to introduce them to the world with a preface. In 1779 Mr. Newton was presented by his friend, Mr. Thornton, to the valuable living of St. Mary Woolnoth, London, with which was united that of St. Mary Woolchurch, and there he spent the remainder of his days, one of the most popular preachers and writers, and one of the most influential members of the so called Evangelical section of the Church in the metropolis. He continued to preach with little abatement of vigour till he was turned of eighty, and he died Dec. 21, 1807, aged eighty-two. Besides the works above mentioned, he published a volume of letters which rivalled his Omicron Letters in popularity, under the title of 'Cardiphonia, or the Utterance of the Heart in the course of a real Correspondence;' a volume entitled 'A Review of Ecclesiastical History,' 8vo, 1770; 'Letter to a Wife,' 8vo, 1793, and numerous sermons, tracts, &c., all of which were collected and published after his death under the general title of 'Works of the Rev. John Newton,' of which a second edition, in 6 vols 8vo, appeared in 1816.

(Newton's *Narrative;* Cecil, *Life of Newton;* Southey, *Life of Cowper;* Newton's *Works,* &c.)

* PARKES, JOSIAH, was born in Warwick in 1793, and received his education under the elder Dr. Charles Burney at Greenwich. He adopted the profession of a civil engineer. In 1839 he was appointed by the Board of Trade one of two commissioners to inquire into the causes of steam-vessel accidents, and the means of prevention; on which he made a report, which was printed in the same year by order of the House of Commons. In 1816 he was appointed draining engineer to the office of Woods and Forests, and in 1856 to a similar office under the Board of Works. As a draining engineer, Mr. Parkes has conducted some of the largest public and private works in this country; and his eminent success has given a great impulse to this practice, by which the value of land and its productiveness have been so largely increased. In 1821 Mr. Parkes published a work 'On the Means of Consuming the Smoke of Steam-Engines and other Furnaces.' During the years 1839-42 he communicated to the Institution of Civil Engineers valuable papers, 'On Steam-Engines,' 'On Steam-Boilers,' and the 'Percussive Action of Steam,' which were published in the 'Transactions' of the Institution, and the gold and silver medals were awarded him for them. In 1845, in vols. v. and vii. of the 'Journal of the Royal Agricultural Society of England,' he published 'Essays on the Philosophy and Art of Land Draining,' and 'On Climate, Soils, &c.,' which also appeared as a distinct work, and which has been translated into most European languages.

PARKES, JOSEPH, the brother of the preceding, was born at Warwick, in January 1796. He was educated partly at the same school with his brother, then under the Rev. Allen Wheeler, canon of Worcester, and in 1811-12 studied at Glasgow University. He adopted the law as a profession, and practised as a solicitor at Birmingham with great success. During his residence at Birmingham he became remarkable for his advocacy of those social and political changes which constitute so important a feature in the history of the last quarter of a century. During the great struggle for parliamentary reform, no man exercised a greater influence upon popular opinion, or contributed more to the success of that measure by most strenuous co-operation with its advocates in the two Houses. In 1833 he gave up his business in Birmingham, on being appointed secretary to the Royal Commissions for inquiry into the Municipal Corporations of England and Wales, and on their Boundaries. He was afterwards solicitor to the Charity Commission Chancery Suits; and to the Births, Deaths, and Marriages Registration Public Office. In 1847 he was appointed a Taxing Master in Chancery, an office which he still holds. He has published, 'A History of the Court of Chancery,' 8vo, 1828; 'The Equity and Real Property Laws of the United States of North America,' 1 vol. 8vo, 1830; 'The Governing Charters and Municipal History of Warwick;' 'The Claim of the Subscribers of the Birmingham and Liverpool Railroad to an Act of Parliament, in reply to the Opposition of the Canal Companies,' 8vo, 1825; 'The Prerogative of Creating Peers,' 8vo, 1830 and 1856; 'The State of the Courts of Requests and Criminal Jurisdictions of Birmingham and Warwickshire, with complete tables of local Education and Crime,' 1828. He has also contributed various articles to the Retrospective, London, and Westminster Reviews. [*See* SUPPLEMENT.]

RENDEL, JAMES MEADOWS, a civil engineer of great eminence, was born in 1799, at a village on the borders of Dartmoor, in Devonshire; his grandfather, Mr. Meadows, was a well-known architect, and his father, who was a county surveyor and land farmer, was a man of ability, excellent common sense, and determination of character, qualities which descended to the son, whilst to his mother, who was a woman of considerable acquirements, he owed the rudiments of his early education. After being practically instructed in the executive part of his profession, he went to London and obtained an engagement under Mr. Telford [TELFORD, THOMAS], by whom he was employed on the survey and experiments for the proposed Suspension bridge over the Mersey at Runcorn, and subsequently on the survey and construction of roads in the north of Devon, where the difficulties he had to contend with contributed much to create that self-reliance so useful to him in his subsequent career. In 1822, he had occasion to apply, on a professional subject, to the late (John, first) Earl of Morley, who,

Digitized by Google

discovering the latent talents of the young engineer, then scarcely twenty-three years of age, shortly afterwards confided to him, with the approval of Mr. Telford, the construction of a cast-iron bridge across the Lary, an arm of the sea within the harbour of Plymouth, over which his lordship was proprietor of an ancient ferry, for which it was desirable to substitute a bridge, the south bank of the Lary at Saltram being his property. This bridge, consisting of five elliptical arches, was, with the exception of that of Southwark, the largest cast-iron structure of the kind in the kingdom. Mr. Rendel was engaged in its construction from 1824 to 1827. For his account of this work the Telford medal of the Institution of Civil Engineers was awarded to him. About this period he designed and executed the Boucombe bridge, where hydraulic power was for the first time applied to the machinery for working swing bridges. Soon after the completion of the Lary bridge, Mr. Rendel settled in Plymouth, and there exercised his profession with great activity, being engaged in surveying and reporting upon nearly all the harbours in the south-west of England, and executing the works at a great number of places, acquiring that mastery over hydraulic engineering on which his fame will chiefly rest. In 1831 he introduced a new system of dressing piers by means of floating bridges worked by steam-power; they were applied at Saltash and at Torpoint on the river Tamar, and subsequently at Southampton and Portsmouth; but the rapid progress of the railway system prevented the further development of this useful invention, for which the Telford medal was awarded. Descriptions of the structure of these bridges, as well as of that over the Lary, were published in the 'Transactions of the Institution of Civil Engineers.' Particulars of the construction of the latter were also communicated by Mr. Rendel, in 1829, to the Plymouth Institution, of which he was a member, and published in the following year in the only volume that has hitherto appeared of its 'Transactions.'

The repairs of the Montrose suspension bridge, after its fall, were confided to him, and he there introduced the system of imparting that rigidity to the platform of the road way which is now admitted to be so essential to the safety of suspension bridges.

In 1838 Mr. Rendel removed to London, where he was soon consulted upon many important works, and was engaged in the chief parliamentary contests of that remarkable period in the history of engineering. About this time he published the plan of Millbay docks where he introduced the system of construction since employed with so much success at the harbours of Holyhead and Portland. Engagements poured in fast upon him, and his career was for the next few years one of unceasing activity, chiefly in the construction of harbours and docks, and the improvement of rivers and estuaries. In the year 1843, the projected construction of docks at Birkenhead, in Cheshire, of such an extent as to create a formidable rival to Liverpool, brought him very prominently before the world; and the protracted contests on this subject will be long remembered in the history of parliamentary committees, for the ability with which he defended his positions; and the evidence given by him and other engineers, as now collected, forms a valuable record of the state of engineering practice. The almost incessant labour, and the mental anxiety inseparable from this undertaking, were more than even his powerful constitution could support, and it is feared that they tended to shorten his life.

The daring project of constructing a dock at Great Grimsby, by projecting the works far out upon the mud-banks of the Humber, was next successfully accomplished; and he commenced the two great works which alone suffice to hand down his name to posterity, beside those of Smeaton, Rennie, and Telford,—the harbours of refuge of Holyhead and Portland. Both these works were conceived with the largest views, and have been carried on with great rapidity. In both cases the system was adopted of advancing timber stages over the line of the jetties and depositing the large and small stones together, as they came from the quarries, by dropping them vertically from railway waggons into their positions, thus bringing up the mass simultaneously to above the level of the sea. These two great works are advancing very satisfactorily; and it is worthy of remark, in evidence of the engineer's sagacity in the adoption of this system, that although the severe storms which have repeatedly occurred on the exposed coasts where they are situated, have done some injury to portions of the stages, and of the temporary works, at Holyhead—where the piles were not shod with Mitchell's screws, which proved so successful at Portland—not a stone would appear to have been carried away from the jetties; and the success of the system may be said to be complete, in spite of the sinister predictions which prevailed before it was tried. Among the other works upon which Mr. Rendel was engaged, should also be mentioned the constructions on the River Lea, and the improvements of the Nene River. He was also employed by the Exchequer Loan Commissioners to report upon the drainage and other public works in Ireland.

He was less engaged in railways than hydraulic works; but in England he executed the Birkenhead, Lancashire, and Cheshire Junction Line, and he had the direction of the "East Indian" and the "Madras" railways in India, the former projected by Mr. (now Sir Rowland) Macdonald Stevenson, as the first of the vast system now in progress, which will doubtless exert a mighty influence on the future destiny of our Indian Empire. The Ceylon line and that of Pernambuco in Brazil were also under his charge.

There was scarcely a harbour or a river of importance in the kingdom with which Mr. Rendel was not connected in some capacity. His advice was also sought by foreign countries; and he was engaged to report upon works for the Brazilian, the Prussian, and the Sardinian governments, and was nominated by the Viceroy of Egypt a member of the International Commission for considering the construction of the proposed canal across the Isthmus of Suez.

In consequence of the danger which threatens the port, and therefore the city and republic, of Hamburg with ruin, from the rapid accumulation of sand in the bed of the Elbe, the Senate, in 1855, requested Mr. Rendel to examine into the navigation of that river, and make proposals for averting the danger. A commission of such importance could not have been intrusted to more able hands. He spent some months in studying on the spot the nature of the difficulties to be overcome. Towards the end of the year he sent in a most able report, with a detailed account of his plan for remedying the navigation, and preventing any future recurrence of the deposit of sand and formation of a bar in the river. This report was printed and laid before the Bürgerschaft, or representative body of the citizens, but down to a very recent period the requisite works had not been commenced, or even determined upon, notwithstanding the rapid increase of the evil. Mr. Rendel proposed to construct a longitudinal dam or dyke in the middle of the Elbe, beginning at the island of Finkenwerder, a few miles below Hamburg, and extending down the river stream for a distance of nearly forty miles. This would contract the main body of the river into about half its natural limits, and the constant rush of the ebb and flood tides would not only sweep away the present sand-banks and other existing obstacles, but prevent them from ever forming again, deepen the channel, and constantly keep clean the bed of the river. The estimate allotted for the execution of this great work was seven years, and his estimate of the expense amounted to 650,000*l*.

In the words of the 'Proceedings of the Royal Society,' from which, with some omissions and corrections, the present article is principally, though not wholly, derived, the subject of Mr. Rendel was of great engineering, clear perception and correct judgment; his practical knowledge was well directed, and he knew how to make good use of the scientific acquirements and skill of all whose services he engaged. His evidence before parliamentary committees was lucid and convincing, seldom failing in carrying his point; and his reports on engineering works are distinguished by the clearness and correctness of his views, and the fearless expression of his opinion."

Mr. Rendel was a very early member of the Institution of Civil Engineers, having joined it in 1824. His professional character, administrative ability, and scientific knowledge, conspired to give him a seat in the council as Member and Vice-President for the sixteen years preceding his death; and he was elected president in 1852 and 1853. He had become a Fellow of the Royal Society on the 23rd of February 1843; and, agreeably to the system which has of late prevailed of adding to the representative element of science in the council of that body, those of other scientific establishments, during the years for which he was president of the Institution of Civil Engineers, he was also a member upon the council of the Royal Society. Mr. Rendel was as amiable and kind in private life as he was energetic and firm in public, and his decease, which occurred on the 21st of November 1856, cast a gloom over the whole of the profession of which he was a brilliant ornament.

RIGAUD, STEPHEN PETER, M.A. F.R.S., Savilian Professor of Astronomy in the University of Oxford, was born at Richmond, Surrey, in the year 1774, and was descended from a French family of consideration who fled to a foreign land on the revocation of the edict of Nantes. His maternal grandfather and his father had the care of the observatory of king George III. at Kew (one of the electrical, magnetical, and meteorological establishment of the British Association), an appointment which probably influenced the early tastes and predilections of the son, on whom it was afterwards conferred. He was admitted a member of Exeter College, in 1791, at the early age of sixteen, and continued to reside there as fellow and tutor, holding also in succession many university offices, until 1810, when he became Savilian Professor of Geometry, and also reader in Experimental Philosophy, which latter appointment he retained through his life. He had been chosen a Fellow of the Royal Society on the 30th of May 1805. Professor Rigaud succeeded in 1827 to the care of the Radcliffe Observatory at Oxford; and the noble suite of instruments by Bird [BIRD, JOHN] with which it is furnished, was augmented, on his recommendation, by a new transit-instrument and circle, so as to fit it for the most refined purposes of modern practical astronomy. He became at the same time, Savilian Professor of Astronomy, relinquishing the chair of Geometry.

The original observations made by Dr. Bradley [BRADLEY, JAMES] at Kew and at Wanstead, with the zenith sector, and the records of the progress of his celebrated discoveries of the aberration of light and the nutation of the earth's axis, had long been considered a desideratum in the history of astronomy. The principal part of these valuable documents (all which had been presented to the University of Oxford), had been apparently lost, having been lost sight of for upwards of seventy years; but were discovered by the diligent search of Professor Rigaud, amongst the papers of the deceased Rev. Dr.

Digitized by Google

Hornsby, one of his predecessors in the Savilian chair of Astronomy, and the first Radcliffe observer, whose family readily restored them to the University. They were now edited by Professor Rigaud, together with other documents collected from various sources, and published in 1831, under the title of 'The Miscellaneous Works and Correspondence of Bradley,' forming a work which will ever be regarded as a most valuable record in the history of Astronomy. To it, he afterwards added an interesting 'Supplement' on the astronomical papers of Harriot (HARRIOT, THOMAS) which contain the earliest records in existence of observations of Jupiter's satellites and of the solar spots, though their author was not the discoverer of either series of objects. In 1838, Professor Rigaud published some curious notices of the first publication of the Principia of Newton; and he had also projected a life of Halley, with the view of rescuing the memory of that great man from much of the injurious obloquy to which it has been exposed, having, in 1834, communicated to the Royal Astronomical Society some biographical particulars of Halley, contained in a manuscript memoir preserved in the Bodleian Library; he had made extensive collections also for a new edition of the mathematical collections of Pappus [PAPPUS, ALEXANDRINUS]. He was the author of many valuable communications to the Ashmolean Society of Oxford (of which he was one of the originators), and to the Royal Astronomical Society, as well as to the later Journals of the Royal Institution, to the 'Edinburgh Philosophical Journal' and 'Journal of Science,' to the 'Philosophical Magazine' when united with the latter, and other scientific periodicals, on various subjects connected with mathematical, physical, and astronomical science. There was probably no other person of his age who was equally learned on all subjects connected with the history and literature of astronomy; as a mathematical antiquary and bibliographer he was unrivalled, at least in this country, until the gradual adoption of similar pursuits by Professor De Morgan. One of his later productions, on a subject not historical, was a valuable paper 'On the relative quantities of land and water on the surface of the terraqueous globe,' published in the sixth volume of the 'Trans. Camb. Phil. Soc.'

Professor Rigaud was a man of most amiable character, and of singularly pleasing manners and person, as the contributor of this article can bear witness. The warmth of his affections, his modesty, gentleness, and love of truth, as well as the great variety of his acquirements and accomplishments, had secured him the love and respect of a large circle of friends, not merely in his own University, but among men of science generally. The qualities just alluded to were characteristically evinced by the part he took in the discussion which arose in the year 1836 (occasioned by the publication of Mr. F. Baily's account of Flamsteed), on the characters and mutual conduct of that astronomer, and of Halley and Newton. He died in London on the 16th of March 1839, after a short but painful illness.

At the time when he was thus suddenly taken from his labours, he was engaged in editing and printing a selection of the letters of scientific men of the 17th century, extending from 1706 to 1741, the autograph originals of which, formerly in the possession of the father of Sir William Jones, had been acquired by George, fourth Earl of Macclesfield; the publication having been undertaken by the university. But the printers declaring themselves unable to work from the originals, Professor Rigaud transcribed the whole correspondence (now occupying nearly 1000 pages in octavo) in modern orthography. He had printed the first volume, and, after his decease, his eldest son, *Stephen Jordan Rigaud, entered upon the work with the second, and published both in 1841, under the title of 'Correspondence of Scientific Men of the 17th Century, including letters of Barrow, Flamsteed, Wallis, and Newton.' Professor Rigaud married, on the 8th of June 1815, the eldest daughter of the late Gibbes Walker Jordan, Esq., F.R.S., Barrister, of Portland Place, London, colonial agent for the Island of Barbadoes (author of three memoirs on the allied subjects of the inflections of light, the colours of thin plates, and the Irides or Coronæ seen around the sun, &c.). By this lady, who died in 1827, he left seven children. His eldest son, already mentioned, the Rev. Dr. Rigaud, formerly Fellow and Tutor of Exeter College, afterwards in succession second master of Westminster School and head-master of Ipswich School, Suffolk, was Mathematical Examiner in 1845, and became in 1846 one of the select preachers of the University. In November 1857 he was appointed to the colonial bishopric of Antigua. He died June 23, 1859.

*RUSSELL, JOHN SCOTT, F.R.S., the eminent civil engineer, is the eldest son of the Rev. David Russell, and was born in the Vale of Clyde in 1808. He was and educated at Edinburgh University, where he graduated in 1824. While a mere child he had shown great fondness for mechanical pursuits, and his father having encouraged his inclination, he early acquired considerable mechanical dexterity, and during his residence at Edinburgh sedulously studied dynamics and the connected branches of mathematical and physical science. So highly were his attainments estimated, that on the death (in November 1832) of Sir John Leslie, professor of natural philosophy in the University of Edinburgh, he was called upon to deliver in his place the usual natural philosophy course of lectures. Mr. Russell was for some time at the head of a ship-building yard in Greenock, and afterwards of an engineering establishment in Edinburgh. He removed to London in 1844. The construction of steam-carriages for running on common roads was occupying much attention, and Mr. Russell invented one which ran regularly for some time between Glasgow and Paisley: a paper in the 'Foreign Quarterly Review' for October, 1852, on Steam-Carriages was understood to be written by him. The construction of ships and boats of iron led him to pay attention to the forms of vessels, and a project which was adopted for running swift passenger boats on a canal induced him to consider more particularly what form a boat should take so as to produce the least 'swell' in passing through the water, and he accordingly made numerous experiments on the oscillations produced in the waters of the canal by the passage of vessels along it. He embodied the results of his inquiries and experiments in a paper which he read before the British Association at the meeting held at Dublin in 1835. Great interest was excited, and he was requested to continue his experiments, Sir John Robinson being associated with him in the conduct of them. These experiments and inquiries—which Mr. Russell chiefly directed, and to which he gave all their value by his fruitful deductions—were extended over a long course of years, and made in an immense variety of forms both in small pieces of water, in canals, in tidal rivers, in estuaries, and on the ocean—with small and with large models, with boats constructed for the purpose, with steamers and with sailing ships. In all, some 20,000 distinct experiments were made. From year to year Mr. Russell reported to the British Association the course of his experiments and the principles which he educed from them.

Very early in the course of these experiments he discovered or observed what he termed 'the Great Solitary Wave,' or 'the Primary Wave of Translation,' and conceived the idea that it was possible so to adapt the form of the hull of a ship as to cause the least displacement of an adverse wave, and to obtain the largest assistance from the wave of translation which it produces in moving rapidly through the water; and hence he arrived at the conclusion which he stated in his paper read before the British Association in 1839—"That in a voyage by a steam-vessel in the open sea, exposed to adverse as well as favourable winds, there is a certain velocity, high speed, and form of power, which may be accomplished with less expenditure of fuel and of room than at a lower speed with less power." In order to obtain this advantageous result, he conceived that the vessel should be constructed with such a form that the lines or curves of the bow should bear a definite conformity with the curves of a 'wave of translation,' whilst the lines of the stern, in like manner, should conform to what he termed the 'wave of replacement.' He called this the 'wave principle,' and a vessel constructed according to it he described as 'the wave of least resistance.' Vessels on this construction on that principle. The first appears to have been the Fire King yacht, which was found to be swifter than any other of its size in the kingdom. Next some steamers were built with equal success. It was adopted by Mr. Brunel when he built the Great Western, the largest steamer then in existence. Professional prejudices prevented the general adoption of the new system, but it steadily made its way both in this country and America, and now all vessels intended for swift sailing, including the noted American clippers, and the great sea-steamers, whether propelled by screw, paddle, or paddle, are built in more or less close approximation to the 'wave form.' The consummation of the principle, according to its author, and that which will most fairly test its correctness, will be found in the Great Eastern, the construction of which, under the direction of Mr. Russell, has excited much general attention during the last three years, but especially during the last few months. In a 'On the Mechanical Structure of the Great Ship' that his latest paper read before the British Association (August 1857) was written. This enormous ship is built on lines laid down by him in strict accordance with his wave principle; but the form therefore is that of Mr. Russell: the constructive principles are those of Mr. Brunel, the most remarkable feature being the application for the first time in a ship of the 'cellular principle,' which was employed with so much success in the Britannia (tubular) Bridge across the Menai Strait at Bangor. As Mr. Russell stated in the paper above mentioned, 'when a vessel is about to be built, intended to attain a certain speed, from ten miles an hour upwards, reference to the table of the wave principle informed them of the length which the bows and stern must be, and of the peculiarity of construction necessary in order to procure the desired result. According to this principle, it was necessary, in order to acquire the speed which this vessel was to attain, that the length of her bow should be 330, the length of her stern 250, of the midship 120, which, with ten feet for the screw propeller, gave her an entire length of 680 feet' [the figures, it will be seen, exceed 680]. He inferred therefore that, "while increasing the carrying or paying power of the ship to an immense extent, its mode of construction was such that the increase in the resistance of the water was in a much lower ratio, so that the vessel, notwithstanding its enormous size, could be worked as economically as a smaller one."

Mr. Russell, having read a paper on his investigations before the Royal Society of Edinburgh in 1837, was awarded the Society's large gold medal, and elected a Fellow of the Society. In June 1849 he was elected a Fellow of the Royal Society of London. He was for some time secretary of the Society of Arts, and, in connection with that society, was one of the originators of the Great Exhibition of 1851. He was also one of the nine gentlemen who purchased the building with a view to its re-erection at Sydenham.

SABINE, MAJOR GENERAL EDWARD, R.A., President and Treasurer of the Royal Society, one of the distinguished leaders in the conquest of nature, which the scientific branches of the British Army have contributed to society, is of Irish extraction, and was born in 1790. He first became known to the public, as Lieutenant Sabine, from his accompanying Captain (afterwards Sir John) Ross, and Lieutenant (afterwards Sir Edward) Parry, in the first Arctic Expedition of the series to which it belonged. The results of the magnetic observations which were made by him in the course of the voyage must be looked to, as an eminent philosopher, Dr. Peacock, has lately observed, "as having given the first great impulse to the systematic study of the phenomena of terrestrial magnetism." It appeared from the statement which he communicated to the Royal Society upon his return (in two papers inserted in the 'Philosophical Transactions' for 1819, being his first contributions to that collection), that the directive force of the horizontal magnetic needle in the Arctic regions was so much reduced by the greatness of the vertical force occasioning the dip, that the best suspended compasses not only traversed with great difficulty, but were so much dominated by the magnetism, whether induced or permanent, of the masses of iron in the ships themselves, that their indications became utterly useless. The peculiar character of the mind of Captain Sabine, as he had now become, leading him to experimental or observational research in those departments of terrestrial physics, which, the forces to be observed or measured, varying with the geographical position of the place, require for their investigation, the transport of instruments or apparatus from latitude to latitude, he commenced in 1821 a series of voyages, from the equator to the arctic circle, principally in order to determine the length of the seconds' pendulum in various latitudes and localities. The results, which were of great value in relation to the figure of the earth, were published in a quarto volume in 1825, together with Geographical, Hydrographical, and Atmospherical notices. This valuable work is now rare, having, with a too scrupulous conscientiousness bean to a great extent suppressed by the author, in consequence of certain clerical errors in reading the division of the level of a small astronomical circle, of which it would have sufficed widely to make known the correction. Similar researches and observations continued for some years to engage Captain Sabine's attention, in the intervals of his military duty in Ireland, in the course of which he attained the rank of Major. In 1836 he made some valuable observations on the direction and intensity of the magnetic force in Scotland, which he communicated to the British Association at the sixth meeting, held at Bristol in that year, in the 'Reports' of which they were published. To the meeting at Liverpool, in the following year, he communicated a valuable Report 'on the variations of the magnetic intensity observed at different points of the earth's surface.' In the next year he produced a memoir on the magnetic isoclinal and isodynamic lines in the British Islands. These, and subsequent contributions to the subject of terrestrial magnetical research, gradually paved the way for the establishment of permanent magnetical observatories, and especially for those established by the British government in various colonies, at the joint recommendation of the Royal Society and British Association. These have supplied the most precious results. In the words, again, of Dr. Peacock, he is for this distinguished observer, that we are chiefly indebted for the organisation of the vast system of magnetic observatories which have been established in later times, and for the complete discussion of the observations which they have afforded, and which have totally changed the aspect of the science of magnetism."

The colonial observatories are under the superintendence of General Sabine, whose discussions of the observations have been communicated to the Royal Society, and published in the 'Philosophical Transactions,' and also, together with the observations themselves, in a series of large volumes. Two of the latest most striking inductions made from them by him are the magnetic operation of the sun, independent of its heat, and the coincidence of the period of certain magnetic phenomena, with that of the cycle of changes of the solar spots. But his introduction to the Toronto observations, last published, vol. iii., also made public in the 'Proceedings of the Royal Society,' 1857, is memorable in a higher point of view. It contains the recommendations of the philosopher, full of years and honour, as to what is now desirable in the continuance of the Observatories; on which subject he remarks, (in the Proceedings,) with a feeling all will appreciate, "There is another advantage (if it be one) which might attend the early prosecution" [of what he recommends] "viz., the opportunity of consulting (if it were desired to consult) the experience of the person who has conducted—and, as he believes, successfully conducted—the first experiment from its commencement now almost to its close; but this, in the course of nature, can only be available for a few years to come."

We have been compelled to omit noticing many other researches, observations, and experiments of General Sabine, especially on the Pendulum and in Meteorology. Most of them have appeared in his work already mentioned, and in the 'Transactions' of the Royal Society, and British Association. Numerous minor but not unimportant papers by him will be found in the 'Philosophical Magazine.' He was elected a Fellow of the Royal Society in April 1818; in 1850 he succeeded Mr. George Rennie as Treasurer and Vice-President, and in 1861 was chosen President after Sir B. Brodie retired. Among the active Fellows of the Society there are very few of equal seniority. He became a member of the British Association in 1837, and was nominated on the council in the following year, and from 1839, with short intervals, he has been one of the general secretaries, and for some years past sole general secretary: at the meeting at Belfast, in 1852, he filled the honourable office of President. Mrs. Sabine is the translator of Humboldt's 'Cosmos' and 'Aspects of Nature,' to which, but particularly to the 'Cosmos,' General Sabine added many valuable notes in his own branch of science.

The elder brother of the subject of this notice, Mr. Joseph Sabine, F.R.S., F.L.S., who held for the greater part of his life the responsible office of Inspector-General of Taxes, was educated in the University of Dublin, and devoted himself from a very early period of life to the study of botany, ornithology, and other branches of natural history. He became secretary to the Horticultural Society of London at the period of its first establishment, and must always be considered as the chief author of its successful and complete development; in addition to his official and editorial services, contributing to its 'Transactions' no fewer than sixty-four papers, the most important of which are those on the genera Crocus, Dahlia, and Chrysanthemum. He was also an active and valuable early member of the Zoological Society, whose gardens were greatly indebted to his taste. He died in 1837.

Mr. Henry Browne, F.R.S., of Portland-place, London, whose wife was sister to these gentlemen, deserves mention here, because (in the words of the late Mr. Davies Gilbert, M.P., President of the Royal Society, in his Anniversary Address to that body for 1830) "No man was ever more distinguished in the important station of commanding those vessels which secure to England the commerce of nations unknown to former ages; nor did any one more largely contribute towards introducing the modern refinements of nautical astronomy, which, skilfully employed, and under favourable circumstances, determine the place of a ship with greater accuracy than what in the early part of the last century would have been thought amply sufficient for headlands, roadsteads, or harbours of the first importance. . . . . Retired to private life," Mr. Browne usefully amused his declining years by a continuance of his favourite pursuits; and was the latest period of his life he patronised, encouraged, and promoted practical astronomy." His house in Portland-place (No. 2, situated in N. lat. 51° 31′ 8″·4) is a classical locality in the history of English terrestrial physics. Captain Kater's (Kater, Henry) original experiments, made with his own convertible pendulum, for determining the length of the seconds' pendulum in the latitude of London, as the intended standard of linear measure, were made in Mr. Browne's house, and with his assistance. ('Phil. Trans.,' 1818.) Mr. Browne had become possessed of the original Ramsden brass scale of General Roy, which formed the basis of the Trigonometrical Survey of Great Britain. Here also, and with the same aid, General (then Captain) Sabine made his final observations for determining the oscillation of the pendulum in different latitudes, as referred to in the first two Arctic expeditions. ('Phil. Trans.,' 1821.)

**SCHLEIDEN, MATTHIAS JACOB, German botanist and physiologist, professor of botany in the University of Jena. He was educated for the medical profession and studied under his uncle, Professor Horkel of Berlin, who is well-known for his researches upon vegetable physiology. One of the earliest productions of Professor Schleiden, by which his name became associated in Europe with discoveries in vegetable physiology, was entitled 'Contributions to Phytogenesis,' and published in Müller's 'Archiv für Anatomie und Physiologie,' Part II. for 1838. This paper was translated by Dr. Francis, and published in the second volume of Taylor's 'Scientific Memoirs.' It was also republished by the Sydenham Society in England, in 1847. This indicates the importance attached to this paper. In it the author, for the first time, drew attention to the process of the growth of cells. It had already been shown that vegetable tissue consisted almost entirely of cells, but Schleiden now asserted that every vegetable tissue originated in cells, and that every cell originated in a nucleus or small mass of nitrogenous matter, which he called a 'cytoblast.' He supported the enunciation of this great law by a vast number of observations made by the microscope, and drew attention to the fact, that henceforth the functions of the life of plants must be studied from the point of view of the function of each individual cell. The sensation produced by this paper can hardly be overrated. At first it excited opposition amongst botanists, but this opposition had hardly time to declare itself before a paper appeared by Dr. Thomas Schwann, professor of anatomy in Louvain, entitled 'Microscopical Researches into the Accordance in the Structure and Growth of Animals and Plants,' in March 1839. In this essay Dr. Schwann demonstrated that the law which Schleiden had laid down for the vegetable kingdom was equally applicable to the animal kingdom. He showed that the tissues of animals were, like those of plants, made up of cells, and that each cell originated in a primitive cytoblast. Although the views of Schleiden and Schwann have been somewhat modified by the progress of discovery, the great fundamental facts which they made known in the above papers lie at the present moment at the foundation of all physiological science, and the period which was thus initiated may be regarded as even of more importance than that which occurred on the discovery of the circulation of the blood by Harvey.*

Since the period of the production of this great paper, Schleiden has very constantly appeared before the world as a contributor of facts to the science of vegetable physiology. The result of his

Digitized by Google

studies and original investigations he published in a systematic work, entitled 'The Principles of Scientific Botany, or Botany as an Inductive Science.' This book was translated into the English language by Dr. Lankester, and was published in London in 1849. It embraced a full account of his views on the development of plants, and also of his researches upon their impregnation. As the result of these he maintained that the pollen-tube is converted into the young embryo, a view which he has since abandoned. This work contained the freest possible criticism upon the labours of his predecessors, and established a system of morphology and morphological doctrine, which is gradually finding its way into the literature of the science of Botany.

Professor Schleiden, whilst one of the most profound original investigators and thinkers of the day, is one of a few German professors, who have felt it their duty to address a wider class than that which they meet in the lecture-room of the university, and in a language free from "the dust of the schools." With this view he published a series of popular lectures, entitled 'The Plant: a Biography.' These lectures were highly popular in Germany and have been translated in English by Professor Henfrey. The lectures may be classed amongst the most agreeable readings on the subject of natural history science.

Professor Schleiden has also had practical aims in view, and he has most successfully turned his attention to the application of vegetable physiology to agriculture and animal physiology. He was the first to detect the errors fallen into by the too enthusiastic cultivators of the chemical school of physiology, and wrote an indignant disclaimer of Liebig's physiological views, as given in his 'Chemistry of Agriculture.' In the 'Encyclopädie der Gesammten Staatswissenschaften, und Landwirthschaften in ihrer Anwendung auf die Landwirthschaft,' he has written a volume entitled 'The Physiology of Plants and Animals, and the Theory of Agriculture.' In this work he brings his great knowledge to bear upon the practical questions of the farmer and his art.

His papers on various departments of botany are numerous, and they are now being collectively published under the title of 'Beitrage zur Botanik.' Professor Schleiden is a foreign Fellow of the Linnean Society of London, and a member of many of the scientific bodies of Europe.

*SIMPSON, SIR JAMES YOUNG, BART., M.D. an eminent physician, professor of midwifery in Edinburgh University, and the discoverer of the anæsthetical properties of Chloroform, was born in 1811 at Bathgate, Linlithgowshire. He was educated for the medical profession, and took his degree of Doctor of Medicine in the University of Edinburgh. He became assistant to the late Professor Thomson, and in 1840 he succeeded in obtaining the chair of midwifery in the University of Edinburgh. His lecture at once became very popular, and he has probably contributed more than any other professor to the success of the Edinburgh school of medicine. Since his appointment he has contributed very largely to the literature of that department of his profession which he more particularly practises. His papers have recently been collected together and edited by two of his former pupils; they occupy two bulky octavo volumes. In the practice of midwifery, and the diseases of women, Dr. Simpson has suggested many important improvements which are generally recognised by the profession. He owes perhaps a greater degree of reputation to his introduction of anæsthetics into midwifery than any other point of practice. On the discovery in America of the anæsthetic properties of ether, Dr. Simpson immediately availed himself of its agency to alleviate the pains of labour. The ether however produced certain effects which induced him to seek some other agent, and his efforts were rewarded by the discovery of the much more beneficial action of chloroform. There are many other substances which are found to act as anæsthetics, but none so efficiently as chloroform. Hence it is the only substance generally employed at the present day. Dr. Simpson is not only known for his professional knowledge, but for his general literary acquirements. He is a Fellow of the Royal Society of Edinburgh, and taken an active part in all the local societies of that place for the diffusion of a knowledge of science, literature, and art. In 1840 he was elected president of the Royal College of Physicians of Edinburgh. In 1852 he was made president of the Medico-Chirurgical Society of Edinburgh. In 1853 he was elected a foreign associate of the French Academy of Medicine, and he is a member of many other foreign scientific bodies. He was created a baronet, 1866.

SMITH, ADMIRAL SIR SIDNEY, was born at Westminster in 1765, and in his twelfth year was sent as a midshipman on board the Sandwich, Lord Rodney. At the age of sixteen he was made lieutenant, and at nineteen post-captain. War having broken out between Russia and Sweden, he obtained permission to offer himself as a volunteer to the latter power, in whose service he showed so much courage and skill as to lead to his investment with the order of the sword. On the surrender of Toulon to Lord Hood, August 1793, Captain Smith, being in the south of Europe unemployed, hastened thither, and offered his services, which were accepted; and on the evacuation of the city in the following December, the destruction of the French ships of war, which could not be removed, and that of the powder magazines, arsenal, and stores, was entrusted to him. On his return to England he was appointed to the command of the Diamond, with a small flotilla, charged to cruise in the Channel. He succeeded in considerably annoying the enemy, but in attempting to cut out a ship at Havre he was made prisoner. After a confinement of over two years, he, by the assistance of a French officer named Philippeaux, made his escape and reached England in safety. Appointed to the command of the Tigre, 80 guns, and a small squadron, Sir Sidney proceeded to Constantinople, and thence to Acre, which, as the key of Syria, was then closely invested by Bonaparte at the head of 10,000 men. Sir Sidney, with admirable decision and promptitude, brought two of his largest ships close in shore and landed a party of sailors and marines, at the same time sending his friend Colonel Philippeaux, who was a skilful engineer, to assist in directing the fortifications; Bonaparte made several desperate assaults upon the place, but was on each occasion repulsed with heavy loss, and ultimately was compelled to raise the siege and retreat in disorder. This successful resistance was attributed in no small degree to the gallantry and energy of Sir Sidney Smith. In the events which followed Bonaparte's departure from Egypt, Sir Sidney took an active part, and when General Kleber on whom the command of the French army had devolved, offered to evacuate Egypt, Sir Sidney, through without instructions, confirmed the treaty which he made with the Turkish commander to that effect at El-Arish, January 24, 1800. The English ministry however disavowed his procedure, and Sir Sidney continued to participate in the measures adopted for the expulsion of the French. In the battle of Alexandria, in which Abercrombie was killed, Smith received a severe wound. On his return to England the 'Hero of Acre,' as he was popularly designated, was received with great enthusiasm, and among other marks of public approval, had the freedom of the city of London voted him along with the present of a valuable sword.

In 1802 he was elected M.P. for Rochester, and during the brief peace took part in the debates; but on the renewal of war he was appointed to the Antelope, 50 guns, with command of a flying squadron, at the head of which he displayed his wonted activity. In 1804 he was made colonel commandant in the admiral of the blue; and in 1806 he proceeded to the Mediterranean in the Pompey, 80 guns, with a small squadron to harass the French in Naples. He took Capri, succeeded in twice throwing succours into Gaeta, landed his sailors, and battered the fortresses of the French, and renewed, on a smaller scale, his Acre tactics, inflicting at several parts of the coast severe losses upon the troops of Massena. He was not able however to save Gaeta. As long as he was there the garrison was firm, but soon after his departure for Palermo the governor surrendered. In the following year Sir Sidney, now rear-admiral of the blue, joined Duckworth, to the Dardanelles, and there he destroyed a Turkish squadron of one line-of-battle ship, four frigates, four corvettes, two brigs, and two gun-boats. In 1810 he was made vice-admiral: in 1812 he was appointed second in command of the Mediterranean fleet, and remained stationed in the Adriatic for the space of two years, when he was created K.C.B., and received a pension of 1000*l.* for his distinguished services. In 1821 he rose to the rank of full admiral, and in 1830 succeeded King William IV. as lieutenant-general of marines. He died May 26, 1841, at Paris, where, in consequence of pecuniary difficulties arising out of unsuccessful trading speculations, he had been for some years a resident.

SMYTH, REAR-ADMIRAL WILLIAM HENRY, was born January 21, 1788, in the city of Westminster. His father was Joseph Brewer Palmer Smyth, Esq., of New Jersey, America, who having embraced the royalist cause, and fought under General Burgoyne in the War of Independence, was in consequence deprived of his landed property in America, and came to England. He was descended from the celebrated Captain John Smith, of whom a notice is given in the article VIRGINIA, in the GEOGRAPHICAL DIVISION.

William Henry Smyth, after having been some time in the merchant service, entered the royal navy, March 18, 1805, as a midshipman, on board the Cornwallis frigate, Captain Johnston, with whom he continued to serve in the Powerful, 74, till October 1808, when he was transferred to the Milford, 74. During this period he was present in actions at the Isle of France (Mauritius) and the Isle of Bourbon, and cruised in the Pacific. He was also engaged in the expedition to the Scheldt in 1809, and in attacks on the enemy's coasting trade on the French coast. He afterwards proceeded in the Milford to Cadiz, where he was appointed, September 4, 1810, to the command of a large Spanish gun-boat, in which and in other vessels he performed important services, not only in the defence of Cadiz, but in making a survey of the Isle de Leon and of the adjacent Spanish coast, accompanied by details of the strength of the French batteries. The Milford having left Cadiz, and joined the English fleet off Toulon, Mr. Smyth removed August 1, 1811, to the Rodney, 74, in which he attained, December 14, the same year, the rating of master's mate. He was actively engaged till paid off, on his return to England, in November 1812. For his valuable services in the vicinity of Cadiz he was presented by Lord Melville with a lieutenant's commission, dated March 25, 1813.

Lieutenant Smyth was soon afterwards appointed to a command in the flotilla under Sir Robert Hall, employed to co-operate with the British troops in the defence of Sicily. While in this situation he made an elaborate survey of Sicily and the adjacent islands. This important duty, in which he was occupied some years after the British troops had left the island, was performed by order of the Lords of the

Digitized by Google

Admiralty, in consequence of representations of the extremely defective state of the charts of the Mediterranean Sea, and particularly of the coasts and neighbourhood of Sicily. While engaged in these scientific operations, he was appointed by the Lords of the Admiralty to the rank of Commander, Sept. 30, 1815. He married, October 7, 1815, at Messina, Annarella, only daughter of T. W. Herrington, Esq., of Naples. Captain Smyth was unable, from the subsequent political changes, to execute the design he had originally projected of cutting a meridian through the island, and measuring a permanent base-line for the final determination of its true position, extent, and form. He was consequently obliged to execute this survey on a secondary basis, connected with geodetical operations. The utmost precision was used in laying down the astronomical data, and the whole was grounded upon the position of the Observatory at Palermo, as determined by the astronomer Piazzi, and communicated by him to Captain Smyth. The result of these surveys was the publication by the Lords of the Admiralty of an 'Atlas of Sicily,' containing the charts, plans, and views of sea-port towns, and all the remarkable capes and headlands. As an accompaniment to the Atlas, but at the same time an independent work, Captain Smyth published a 'Memoir, descriptive of the Resources, Inhabitants, and Hydrography of Sicily and its Islands, interspersed with Antiquarian and other Notices,' 4to, 1824. In the mean time Captain Smyth, in 1817, was appointed to the Adi, sloop-of-war, and in January 1820, to the Adventure, 8 guns. He was also engaged in completing the survey of the shores of the Adriatic Sea commenced by Napoleon, which he completed in about two years, and the results of his labours were published by the Imperial Geographical Institute of Milan.

In 1823 and 1824 Captain Smyth was employed by the Lords of the Admiralty in making a survey of the coasts of the island of Sardinia. He had previously made two visits to the island during the war with France, and now determined to make himself as well acquainted with its general condition and resources as time and his professional duties would allow. The results of his surveys of the coasts and visits to the interior were published in a 'Sketch of the Present State of the Island of Sardinia,' 8vo, 1828, a work full of accurate observations, and of interesting details concerning the antiquities of Sardinia and the very curious manners and customs of the inhabitants.

Captain Smyth attained the rank of post-captain, February 7, 1824, and paid off the Adventure in the following November. He afterwards settled at Bedford, and built a small observatory in his garden, which he furnished with a transit instrument, a circle, and an equatorial telescope. The result of his observations at this observatory was published in 4 'A Cycle of Celestial Objects for the use of Naval, Military, and Private Astronomers, observed, reduced, and discussed by Captain W. H. Smyth,' 2 vols., 8vo, 1844. Vol. I. contains the Prolegomena; vol. II., the Bedford Catalogue. The Prolegomena contains a sketch of the history of astronomy, an elementary survey of its leading facts, a description of Captain Smyth's own observatory, and advice as to the mode of combining economy with efficiency in the structure and furnishing of such a building; and also plans and drawings of instruments. The second volume, besides 850 observations of celestial objects, contains a mass of detached remarks, on the history of the objects, on preceding observers, and on astronomy generally. The volumes are not only instructive, but amusing and almost popular. Captain Smyth had published previously 'The Life and Service of Captain Philip Beaver,' 8vo, 1829, and a 'Descriptive Catalogue of a Cabinet of Roman Imperial Large Brass Medals,' 4to, Bedford, 1834.

Captain Smyth accepted the retirement pension, October 1, 1846. He attained the rank of rear-admiral, May 28, 1853.

Admiral Smyth's most valuable work, the result of his numerous surveys and observations in the Mediterranean Sea, is entitled 'The Mediterranean, a Memoir, Physical, Historical, and Nautical,' 8vo, 1854. The work is divided into five parts, the contents of which are as follows:—Part I., 'A Chorographical View of the Shores of the Mediterranean Sea, with especial reference to their Produce and Commerce.' Part II., 'Of the Currents, Tides, and Waters of the Mediterranean Sea.' Part III., 'Of the Mediterranean Winds, Weather, and Atmospherical Phenomena.' Part IV., 'Of the Surveys and Geographical Investigations in the Mediterranean Sea.' Part V., 'Of the Orthography and Nomenclature adopted; the Geographical Points—or Co-ordinates of Latitude, Longitude, and Height—of the Mediterranean Shores; with the Variation of the Magnetic Needle, and other Notanda.' There have since appeared, 'Popular Astronomy, by Francis Arago, translated from the original, and edited by Admiral W. H. Smyth and Robert Grant, Esq.,' vol. I, 8vo, 1855; 'Biographies of Distinguished Scientific Men,' by Francis Arago, translated by Admiral W. H. Smyth, Rev. Baden Powell, and Robert Grant, Esq., 8vo, 1857; and a 'History of the New World, by Girolamo Benzoni, of Milan, showing his Travels in America from A.D. 1541 to 1556, with some Particulars of the Island of Canary, now first translated, and edited by Rear-Admiral W. H. Smyth,' 8vo, 1857. (Printed for the Hakluyt Society.)

The scientific world has heaped honours in abundance on Admiral Smyth. In 1821 he was admitted a Fellow of the Antiquarian Society, and of the Astronomical Society; in 1826 he was unanimously elected F.R.S. In 1830 he was chosen one of the council of the Geographical Society of London. He was afterwards one of the committee for improving and extending the 'Nautical Almanac.' He has been created a D.C.L., is one of the Board of Visitors of the Royal Observatory, and has been vice-president of the Royal Society and the Society of Antiquaries, and president of the Astronomical Society, and of the Royal Geographical Society. He is also a corresponding and honorary member of several foreign scientific societies, and has had medals and other rewards presented to him by foreign sovereigns and by scientific societies. [*See* SUPPLEMENT.]

Admiral Smyth has a family of several children. His eldest son, WARINGTON WILKINSON SMYTH, is mining geologist to the Ordnance survey. His second son, CHARLES PIAZZI SMYTH, is astronomer royal for Scotland. In the summer of 1856 Professor Piazzi Smyth undertook the task of transporting a large collection of instruments—meteorological and magnetical, as well as astronomical—to a high point on the Peak of Teneriffe. He selected two stations, at altitudes above the sea of 8840 and 10,700 feet respectively; and obtained important astronomical and magnetical results. The heat radiated from the moon, which has been so often sought for in vain in a lower region, was distinctly perceptible even at the lower of the two stations.

SOWERBY, an English family well known from their publications in naturalists and natural history artists. The principal members of this family are as follows:—

SOWERBY, JAMES, was born March 21st, 1757, and died October 25th, 1822. His father John Sowerby was a lapidary and lived at Bolt-in-Tun Passage, Fleet-street. His son James was born at Mead Place, Lambeth. Having early evinced a taste for drawing he became a student of the Royal Academy and was articled to Richard Wright, a painter of sea-views. He commenced his profession as a painter of portraits and miniatures, of which many exist in London collections. He also engaged in landscape painting, and for the purpose of painting accurately the plants in the foreground of his pictures he commenced the study of botany. This he did under the direction of Mr. W. Curtis, and afterwards assisted him in the production of the illustrations to his botanical works. Sowerby having thus become acquainted with plants, projected one of the most extensive botanical works that has ever been completed in this country. This was the 'English Botany.' In this great work, which contained coloured illustrations of every species of British plant, he was assisted by Sir James Edward Smith, who wrote the descriptions of the plants mentioned in that work. He also published a folio volume 'On the English Fungi or Mushrooms.' This work contained coloured illustrations of all this family that were then known, and embraced figures of several species, published for the first time. It appeared in parts from 1796 to 1799. In 1802 he commenced a series of illustrations of 'British Mineralogy,' comprising an account of the minerals of Great Britain with figures. In 1806 he published a series of illustrations of animals with the title 'British Miscellany, or coloured figures of new, rare, or little known objects of the animal kingdom, many not before described to be natives of the British Isles.' This work was succeeded by another on foreign minerals, entitled 'Exotic Mineralogy,' which was published in parts from 1811 to 1817. His last great work was 'The Mineral Conchology of Great Britain,' in which he gave figures of the various forms of fossil shells, as well as of other animal remains. In the three works, which were undoubtedly the most important natural history publications of the day, Mr. Sowerby contributed many papers to the Transactions of scientific societies, more especially to the Linnean and Geological. He also formed a very large collection of specimens in British natural history, including fossils. The Fungi, which he had drawn, he also modelled with his own hand: this collection of models is now in the British Museum.

Sowerby's labours as an artist, besides those devoted to natural history, were considerable. He published 'A Drawing Book,' and a work on Colours, entitled 'A New Elucidation of Colour.' He was a fellow of the Linnean, Geological, and Zoological Societies. He left three sons and two daughters.

SOWERBY, JAMES DE CARLE, eldest son of the above, was born at Stoke-Newington on the 5th of June 1787, and is the secretary of the Royal Botanic Society, Regent's Park. He was brought up by his father to his own profession of an artist, but in assisting his father he acquired a considerable knowledge of minerals, plants, and animals. He was more particularly engaged in the publication of the British Mineralogy and Mineral Conchology. He supplied the chemical arrangement for the former work, and made the original sketches for the latter half of the English Botany. He also engraved the plates for Smith's edition of 'Stuthorp's Flora Graeca,' which were executed from the unrivalled drawings of Ferdinand Bauer. He contributed a large number of the descriptions of the specimens of fossils, figured in the Mineral Conchology. He has also published numerous descriptions of fossil shells in the Transactions of the Geological Society, and in many local geological works. On his father's death he became the possessor of the collection of fossil shells, figured in the 'Mineral Conchology,' which he still holds. In 1838 he took an interest in the establishment of the Botanic Gardens in Regent's Park and was appointed secretary, and to his energy and perseverance the great success of the Society and Gardens has been in a great measure owing. He is a Fellow of the Linnean and Zoological Societies.

SOWERBY, GEORGE BRETTINGHAM, second son of the above James Sowerby, was born at Lambeth on the 12th of August 1788, and died on the 26th of July 1854. He studied natural history with

Digitized by Google

more success than his elder brother, perhaps on account of his not being so good an artist. In early life he was attached to the study of Entomology, and assisted his father in those departments of his labours where a knowledge of insects was required. On marrying however he gave up his Entomology and commenced business as a dealer in natural history objects, and visited the Continent of Europe for the purpose of obtaining specimens. He bought the celebrated Tankerville collection of shells, for which he gave six thousand pounds. He also bought several other large collections. His knowledge of the forms of shells was very extensive, and he projected and published a great work entitled 'The Genera of recent and Fossil Shells.' This was published from 1820 to 1824. His father and brother executed the drawings and engravings, and he drew up the descriptions. His papers on various species of Mollusca are very numerous, and were published in the 'Zoological Journal,' the 'Proceedings of the Zoological Society,' the 'Magazine of Natural History,' and the 'Reports of the British Association.' A list of these papers, upwards of forty in number, is given in Agassiz's and Strickland's 'Bibliography of Zoology,' published by the Ray Society. Besides these papers and the work on the genera of shells he published several other independent works; amongst these should be mentioned the Catalogue of the collection of the late Earl of Tankerville, 'Species Conchyliorum, or concise original Descriptions and Observations of all the Species of recent Shells with their Varieties,' London, 1830. 'Conchological Illustrations, or coloured figures of all the hitherto unfigured recent Shells, with their varieties,' London, 1832-45. 'Thesaurus Conchyliorum, or Figures and Descriptions of Shells,' London, 1842. He was a Fellow of the Linnean Society.

SOWERBY, CHARLES EDWARD, third son of James, was born on the 1st of February 1795, and died in June 1842. He assisted first his father and afterwards his brother James de Carle in their natural history publications till 1831, when the copyright of 'English Botany' falling to his share, he commenced the publication of a second edition on small paper, with large additions. This work is at present being reprinted by his son, John Edward Sowerby.

*SOWERBY, GEORGE BRETTINGHAM, son of the above George Brettingham Sowerby, was born March 25, 1812, and is now well known as a naturalist and natural history engraver. He has continued the 'Thesaurus Conchyliorum' of his father, and has also contributed largely to the natural history literature of the day. His descriptions of new shells in the Proceedings of the Zoological Society are very numerous. He has also published several independent works: 1. 'A Conchological Manual,' in 1839, of which a fourth edition appeared in 1852. 2. 'Conchological Illustrations,' a continuation of his father's work from 1830 to 1842. 3. 'Popular British Conchology,' London, 1854. 4. 'A popular Guide to the Aquarium,' London, 1857. He is a Fellow of the Linnean Society.

*SOWERBY, HENRY, a younger son of George Brettingham Sowerby, who is now in Australia, commenced his career as a natural history artist and mineralogist. He wrote 'Popular Mineralogy' in Reeve's series of 'Popular Natural History Manuals.'

Other members of this family have also cultivated the same tastes and are known as artists and naturalists.

*TAYLOR, ALFRED SWAINE, a distinguished chemist and medical jurist. He was educated for the medical profession at Guy's Hospital in London, and became a Licentiate of the Apothecaries' Society in 1828, and a member of the Royal College of Surgeons in 1830. He was subsequently appointed lecturer on chemistry to the Guy's Hospital Medical School, and also lecturer on forensic medicine in medical jurisprudence. He has written two works in connection with forensic medicine, which are the principal text-books in our medical schools, and have given to Dr. Taylor a deservedly high position as a chemist and medical jurist. The first of these was entitled 'A Manual of Medical Jurisprudence,' and embraced all those subjects of inquiry which are brought before the medical man in cases of criminal inquiry. The importance of the subject of poisoning and the rapid advances of chemical knowledge in relation to poisons, induced Dr. Taylor to extend this part of his work, and to publish a volume devoted entirely to the subject of poisons. In 1845 he published his second volume, 'On Poisons in relation to Medical Jurisprudence and Medicine.' These works have brought Dr. Taylor into great repute in the investigation of cases of suspected criminal poisoning. Recently he has been employed by the crown in cases demanding chemical research. He was thus employed on the trial of William Palmer for the murder of John Parsons Cook, and although unable to detect strychnia in the contents of the murdered man's body, Dr. Taylor gave his evidence against Palmer on the ground that the symptoms exhibited by Cook could be produced by no other means than strychnia, and that this agent might destroy life without being in sufficient quantity in the body after death to yield proofs of its presence to chemical re-agents. It is well known that a large amount of chemical evidence was brought to combat the latter part of Dr. Taylor's evidence, and subsequent to the trial he published a work 'On poisoning by Strychnia, with comments on the Medical Evidence given at the trial of William Palmer for the murder of John Parsons Cook,' London, 1856. In this work he defends himself from the charges brought against him either directly or indirectly by the evidence got up by the unhappy prisoner. Dr. Taylor edited for some years the 'Medical Gazette,' and has been a frequent contributor to the weekly medical periodical literature.

In 1852 the honorary degree of doctor of medicine was conferred on him by the University of St. Andrews. In 1848 he became a Licentiate of the Royal College of Physicians, London, and in 1853 a Fellow of the same body. He was elected a Fellow of the Royal Society in 1845.

*TSCHUDI, JOHANN JAKOB VON, an eminent naturalist and ethnologist, was born at Glarus, of a knightly family in Switzerland, on the 25th of July 1818. He was educated first at the Gymnasium and then at the University of Zürich, where he devoted much of his attention to natural history and medical science, and displayed a marked talent and interest in scientific pursuits. After his studies in the natural-history sciences he proceeded from Zürich to Neufchâtel, and afterwards to Leyden, where he prepared his 'System der Batrachier,' Leyden, 1838. Subsequently he went to Paris, where an opportunity seemed to present itself of carrying out his strong desire of making a voyage round the world, and he accordingly embarked on board a French ship. On reaching Peru however the vessel was sold to the Peruvian government, and Von Tschudi was constrained to limit his labours to an investigation of the natural history and ethnology of Peru. The limitation of his field of inquiry had however the advantage of enabling him to carry it more thoroughly. He spent five years in the investigation, returning to Europe in 1843; and obstacles having intervened which prevented him from carrying out his wish to accompany Franklin in his Arctic expedition, he determined to devote himself to the completion of the purpose of publication, of the rich mass of materials he had collected in Peru. For this purpose he retired to his estate of Jakobshof, near Weiner Neustadt, in Lower Austria, from whence he has since given to the world a general account of his travels, under the title of 'Peru Reiseerinnerungen aus den Jahren 1838-42,' 2 vols., St. Gall, 1846, which has been translated into English, in 1847, by T. Ross; and the more special works—'Untersuchungen über die Fauna Peruana' (Investigations of the Fauna of Peru), St. Gall, 1844-47, with 72 plates, a work of great value; the splendid 'Antiquedades Peruanas,' Vienna, 1851, with atlas, published in conjunction with Don Mariano Eduardo de Rivera; and his elaborate work 'Die Kechua sprache,' 2 vols, Vienna, 1853, containing a grammar, dictionary, and vocabulary of the language of the natives of Peru. These works display a clear conception of the true purposes of such investigations, and have placed their author among the most eminent of those laborions and learned men who have devoted themselves to that particular department of scientific inquiry. 'Reisen durch Sud-Amerika,' Bd. 2, appeared 1866.

VICO, FRANCIS DE, one of the most distinguished astronomers of modern Italy, the son of Count Ascanio de Vico-Ubaldini and the Countess Amalia Archinto, was born at Macerata on the 19th of May 1805. He was educated partly at the Collegio del Nobili in Frisa, partly in the school of the well-known congregation of the Scolopi at Siena, and entered the Jesuit Society as a novice in 1823. After passing with much distinction through the usual stages, both as a scholar and as a master, in the Roman College of that Society, he was appointed (in 1835) assistant of Father Stephen Dumouchel, who was at that time in charge of the observatory; and it was a sort of prelude of the history of his after career, that one of the first duties assigned to him was to calculate the time of the appearance of the then expected Halley's comet, both according to the elements of Damoiseau and to those of Dumouchel. The young astronomer had the satisfaction of being the first to observe the comet, on the 5th of August 1835. Soon afterwards, de Vico, in consequence of the great age of F. Dumouchel, becoming the principal astronomer of the Roman observatory, undertook a long series of observations for the purpose of ascertaining the suspected error in the latitude of Rome, as determined by his illustrious predecessors, Boscovich, Calandrelli, Conti, and Reichenbach. These observations, which amounted to nearly 8000 in number, were eminently successful, and the result was a correction of an error of two seconds in the received latitude. He engaged at the same time on a similar series of observations for the longitude, in concert with the astronomers of Paris and Naples. Soon afterwards, Father de Vico, at the instance of Schumacher of Altona, undertook a course of observations of the planet Venus, for which the clearness of the Roman atmosphere was peculiarly adapted, with a view to the determination of the time of its rotation upon its own axis. The success of this undertaking contributed more than all his previous labours to establish his reputation among the astronomers of Europe; and his subsequent observations of the satellites of Saturn, and of the inner ring of that planet, as well as his detailed reports on the nebulæ, which about that time had become a prominent subject of interest, fully sustained that reputation.

Father de Vico however is most popularly known as an observer by his numerous and successful discoveries in the cometary system, which he was one of the earliest in more recent times to take up as a systematic study. During the years 1845, 1846, and 1847 he discovered no less than eight of these mysterious bodies, in seven of which his

Digitized by Google

claim to priority of discovery is undisputed. The eighth had been observed by another astronomer two days before it was discovered (independently however) by Father de Vico.

Another more humble but hardly less useful work undertaken by Father de Vico, was an improved and enlarged system of astronomical maps and charts, in which he is said to have made considerable progress; but in this and other works which he had commenced, he was interrupted by the Revolution of 1848, by which, in common with the other members of his order, he was driven from Rome. He was treated with much distinction during his exile by his fellow-astronomers in France and England, and received more than one invitation to fix his residence in either of these countries; but the circumstances of his order at that time determined him upon establishing himself in the United States of America, and he had almost completed his arrangements for the purpose, when he was seized with acute inflammation of the chest, and was carried off after a short illness. He died in London on the 15th of November, 1848, at the early age of forty-three. Father de Vico is chiefly known in literature by his contributions to the 'Raccolta Scientifica,' a scientific journal which owed its origin principally to himself, and which is still continued under a new form.

(*Ragguaglio intorno alla Vita e ai Lavori del P. Francesco de Vico*, Roma, 1851.)

WALLICH, NATHANIEL, M.D. and Ph. D., F.R.S., London and Edinburgh, a celebrated botanist, was born at Copenhagen on Jan. 28th, 1786. He commenced his botanical studies under the direction of Professor Vahl, and went to India in 1807 at the age of one-and-twenty in the capacity of surgeon to the Danish settlement at Serampore. In 1815 he was nominated to the temporary charge of the Calcutta Botanic Garden, which appointment was subsequently permanently confirmed on the recommendations of Dr. Fleming, Mr. Colebrooke, and Sir Joseph Banks. Dr. Wallich's extensive journeys during the three years that elapsed before his first return to Europe added greatly to the extent and value of the previously extensive collections of this garden. He also transmitted to Europe and America a vast quantity of hitherto unknown and beautiful plants. In 1820 Dr. Wallich made a botanical excursion to Nepaul, in the course of which he collected a great variety of plants, many of which he forwarded to London. A severe fever, caught on his descent to the plains, confined him to his bed for two months and compelled him to seek benefit from a voyage to Penang, Singapore, and some other places in the Straits of Malacca, from which, after an absence of five months, he returned on the last day of the year 1822, rich in botanical collections and with renewed health. In 1824 he commenced the publication of a selection from his Nepaul collections under the title of 'Tentamen Floræ Nepalensis Illustratæ,' of which two numbers, containing 25 plates, were issued. These plates were the botanical first fruits of the new art of lithography in India, and both drawings and lithographs were executed by native artists under Dr. Wallich's direction.

In the following year he was deputed by the government to inspect the timber forests of the Western Provinces, and availed himself of this opportunity to examine and collect plants in the kingdom of Oude, the valley of Degra, &c. Excursions to other parts of India were undertaken at various times by Dr. Wallich, which enabled him still further to increase the immense stores of botanical treasure he had accumulated. His health had now however suffered so severely from repeated attacks of illness that, in 1828, he visited England, bringing with him the great bulk of his collections. He then with the consent of the East India Company proceeded to distribute his duplicate specimens amongst the public and private herbaria throughout the world. The type collection, containing a complete series of all the species, was presented by Dr. Wallich to the Linnean Society of London. At this time he completed his work, entitled 'Plantæ Asiaticæ Rariores,' consisting of 300 beautifully executed coloured plates. In 1833 Dr. Wallich returned to India and resumed the charge of the Botanical Garden, which however his health obliged him finally to resign in 1847, when he again arrived in England. He was the author of numerous papers and reports on horticultural and botanical subjects, published in the 'Transactions of the Asiatic Society of Calcutta,' Sir W. J. Hooker's 'Journal of Botany,' and the 'Linnean Transactions.' He became a Fellow of the Linnean Society in 1818, and in 1849 one of its vice-presidents. He was a man of warm affections, ready wit, and pleasing manners, and devoted in his attachment to his favourite science. It must not be forgotten that he did more than any one else, to introduce into the gardens and greenhouses of England the beautiful and luxuriant plants of India, and it is from his collections and descriptions, and presentations to our public and private gardens that we are indebted more than to any other source for our acquaintance with the Flora of that district.

He died at his house in Upper Gower-street, London, on the 28th of April 1854, in the 69th year of his age.

* WHEATSTONE, SIR CHARLES, Professor of Experimental Philosophy in King's College, London, was born at Gloucester in the year 1802. Connected from his birth with business related to the musical profession, his career presents an instructive and gratifying instance, in addition to many we have already recorded, of the happy effects of the devotion of leisure to scientific study, and of the manner in which the ranks of science are recruited from those of trade. But this instance is of a peculiar kind. Mr. Wheatstone, as a seller and maker of musical instruments, in London, was led to investigate the science of sound, both theoretically and practically. His first contribution to science, we believe, was founded on some 'New Experiments on Sound,' made at an early age, and published in the 'Annals of Philosophy,' N.S., for August 1823. Uniting great mechanical ingenuity with clear geometrical conceptions of pure dynamics, he produced from time to time, a variety of instruments and pieces of apparatus, for the illustration of mechanical and acoustic principles, and the production of experiments both of research and demonstration; among which were many (some founded on Dr. T. Young's harmonic sliders,) for the explanation of the nature of waves and undulations and the mode of their propagation, interference, and combination. The study and illustration of the philosophy of sound led to that of the philosophy of light, and in this has consisted the peculiarity of Mr. Wheatstone's career, which, we conceive, affords something very like a practical demonstration of the undulatory theory of light. Had not that theory been essentially true—were not light, equally with sound, produced by the undulations of an elastic medium—had light consisted in the projection of corpuscles—did not acoustics and optics present an harmonious system of perfect mutual analogies—we believe Mr. Wheatstone would not have been led from music to light, and from optics to electricity, and could not have made himself the philosopher he has become. His apparatus and instruments for the production upon true theoretical principles,—or the imitation of such production—and the explanation of optical phenomena, are almost as numerous and valuable as those illustrating sound, with which, indeed, some of them are necessarily identical. The tardy justice with which the truth of Dr. Young's [YOUNG, THOMAS] great discoveries in connexion with the undulatory theory has at last been recognised, by the educated portion of the public, and the intellectual appreciation in this country of Fresnel's consentaneous researches, are both greatly indebted to Mr. Wheatstone for the production of experimental devices, enabling the student to obtain a rational conception of the theory—to perceive in relation to that subject, "that central thread of common sense, on which, in the words of Sir John Herschel, "the pearls of analytical research are invariably strung."

After numerous acoustic and optical investigations, made public in the later Journals of the Royal Institution (some of which were announced and illustrated at the weekly evening meetings), or in the 'Philosophical Magazine,' including experimental inquiries into the principles of various musical instruments, he communicated to the Royal Society, in 1833, through Professor Faraday as a Fellow, a paper on the Acoustic figures which had been summarily investigated by Chladni. In the following year he communicated to the society, through the same medium, his celebrated account of some experiments to measure the velocity of electricity and the duration of electric light.' In the same year (1834) he was appointed Professor of Experimental Philosophy in King's College, London. On the 21st of January 1836, he was elected a Fellow of the Royal Society. On the 21st of June 1838, he communicated a paper to the society (which was read on the same day,) entitled, 'Contributions to the Physiology of Vision. Part I. On some remarkable and hitherto unobserved phenomena of binocular vision.' In this he first described the beautiful instrument he named the Stereoscope, now, in various forms, and with various modifications and additions, so well-known.

But though the stereoscope has deservedly become an object of refined popular admiration, Professor Wheatstone is far better known to the general public, from the application of his scientific genius and attainments to the Electric Telegraph, to the history of which, in connection with himself and with his original co-patentee, Mr. WILLIAM FOTHERGILL COOKE, we must now proceed.

For between sixty and seventy years past, various philosophers have from time to time exhibited experiments on frictional, and on voltaic electricity, in electro-magnetism, and in magneto-electricity—as each branch of the subject became developed—all considered as possible means of communicating intelligence. These gradually improved in definiteness of object, and in the approaches they made to practicability. Dr. Hamel of St. Petersburg, has recently asserted (in a discourse delivered at the meeting at Bonn, in the autumn of 1857, of the German naturalists and physicists,) that the first electro-magnetic telegraph was produced, between 1820 and 1832, by the Baron Schilling, of Lausadon, who had been attached to the Russian embassy at Munich, and become familiar with the previous endeavours of the Bavarian electricians. At the sitting of the Physical section of the meeting at Bonn, in 1835, on September 23rd, of which Professor Muncke of Heidelberg was president for the day, the Baron explained and exhibited his telegraph. The subject received much continued attention from Professor Muncke, who, on the 6th of the following March, 1836—in the words of Dr. Hamel, "explained the whole thing" to Mr. Cooke, at that time occupied in the Anatomical Museum at Heidelberg, in preparing wax models for his father, who had then recently been appointed Professor of Anatomy in the University of Durham. He had not previously studied physics or electricity; but being struck with the vast importance to the railways then extending themselves over Great Britain, as well as to government and general purposes, of a (virtually) instantaneous mode of communication,

Digitized by Google

and impressed with a strong conviction that so great an object might be practically attained by means of electricity, Mr. Cooke immediately directed his attention to its adaptation to a practical system of telegraphing; and, giving up the profession in which he was engaged, he from that hour devoted himself exclusively to the realisation of that object. He came to England in April 1836 (reaching London on the 22nd,) in order to perfect his plans and instruments. On the 27th of February of the following year, 1837, while engaged in completing a set of instruments for an intended experimental application of his telegraph on the Liverpool and Manchester Railway, he became acquainted, through the introduction of Dr. Roget, [ROGET, PETER MARK] with Professor Wheatstone, who had for several years given much attention to the subject of transmitting intelligence by electric velocity, and had made several discoveries of the highest importance connected with this subject. Among these were his determination (which will be again referred to in this article) of the velocity of electricity, when passing, under certain circumstances, through a copper wire; his experiments, in which the deflection of magnetic needles, the decomposition of water, and other voltaic and magneto-electric effects, were produced through greater lengths of wire than had ever before been experimented upon; and his original method of converting a few wires into a considerable number of circuits, so that they might transmit the greatest number of signals which can be transmitted by a given number of wires, by the deflection of magnetic needles.

Mr. Charles Coles Adley, in a paper read before the Institution of Civil Engineers in London, on the 23rd of March 1852, remarks that "no less than four names stand enrolled on the annals of the year 1837 as claimants for the honour of having invented the Electric Telegraph as a practicable reality. These are Wheatstone, Alexander, Steinheil, and Morse." There "can be no question however," he continues, "of Wheatstone's priority in date over Alexander and Morse. Steinheil had repeated Gauss and Weber's experiments before that date, but he did not produce any invention of his own until long subsequently." In June 1836, Professor Wheatstone, in a course of lectures delivered at King's College, had exhibited his experiments on the velocity of electrical circuit of transmission, through eight miles of copper-wire, and had given a sketch of the means by which he proposed to convert the apparatus into an electrical telegraph. A statement to this effect was published in the 'Magazine of Popular Science' on the 1st of March 1838. In the following May, Messrs. Wheatstone and Cooke took out their first patent, which was sealed on the 12th of June, "for improvements in giving signals and sounding alarums, in distant places, by means of electric currents transmitted through metallic circuits." The telegraph thus patented originally consisted of five needles, which were soon afterwards reduced to two. The first line of electric telegraph laid down for useful purposes was constructed, under this patent, in the following year, upon the Blackwall Railway. Five other patents were subsequently taken out by the same patentees, either individually, or in co-operation, for various improvements on the original plan. The electro-magnetic alarum was first patented by them in 1837.

The terms of partnership of the patentees were more exactly defined and confirmed in November of that year, by a partnership deed, which vested in Mr. Cooke, as the originator of the undertaking, the exclusive management of the invention, in Great Britain, Ireland, and the Colonies, with the exclusive engineering department, as between themselves, and all the benefit arising from the laying down of the lines, and the manufacture of the instruments. As partners standing on a perfect equality, Messrs. Cooke and Wheatstone agreed to divide equally all proceeds arising from the granting of licences, or from the sale of the patent rights; a per-centage being first payable to Mr. Cooke as manager. Professor Wheatstone retained an equal voice with Mr. Cooke in selecting and modifying the forms of the telegraphic instruments, and both parties pledged themselves to impart to each other, for their equal and mutual benefit, all improvements of whatever kind, which they might become possessed of, connected with the giving of signals or the sounding of alarums by means of electricity.

For some years after the formation of the partnership, the undertaking rapidly progressed, under the constant and equally successful exertions of the parties in their distinct departments, until it attained the character of a simple and practical system, worked out scientifically on the sure basis of actual experience. In the words of the late Sir M. I. BRUNEL [BRUNEL, SIR MARK ISAMBARD], and Professor Daniell [DANIELL, JOHN FREDERICK], whose apportionment and history of the relative claims and merits of Professor Wheatstone and Mr. Cooke, in respect of the electric telegraph, we have here with some additions adopted, "Whilst Mr. Cooke is entitled to stand alone as the gentleman to whom this country is indebted for having practically introduced and carried out the electric telegraph as an useful undertaking, promising to be a work of national importance, and Professor Wheatstone is acknowledged as the scientific man whose profound and successful researches had already prepared the public to receive it as a project capable of practical application, it is to the united labours of two gentlemen so well qualified for mutual assistance that we must attribute the rapid progress which this important invention has made during the few years since they have been associated." These statements were made in 1841. With the commercial and the political extension which electric telegraphy, in various forms, has made during the seventeen years that have succeeded, in Great Britain, on the continent of Europe, in America, and in India, beneath the ocean, and between Africa and Europe, most of our readers have been made familiar by the daily sources of contemporary history, or by actual experience. It is understood that the principal subject of this article has reaped a substantial pecuniary reward for his share in the benefit which he has been thus instrumental in conferring upon mankind.

Mr. Adley's paper already referred to, and which has been one of our authorities for this article, is entitled 'The Electric Telegraph; its history, theory, and practical applications.' 'Minutes of Proceedings of the Institution of Civil Engineers,' v. 1. xi. pp. 299–329; to which is appended 'The Electric Telegraph, and the principles and improvements in its Construction. By Frederick Richard Window, Assoc. Inst. C.E.' lb. pp. 329-361. These papers were both read on the 2nd of March 1852, and the discussion of them was continued through the two following meetings of the Institution, the minutes of it occupying 27 pages of the printed Proceedings.

The principle of magneto-electric induction treated of by Faraday, was applied to telegraphic purposes by Professor Wheatstone, in his patent of 1840. There are several important secondary applications of the electric telegraph. One of them, first described by Professor Wheatstone, in a paper communicated to the Royal Society on the 26th of November 1840, is to the regulation of clocks, a series of which are worked together by an electric current. Another is an apparatus invented by him communicated to the British Association in August 1842, for registering the indications of the mariner's barometer, &c.; on the actual use of which he reported in the following year. A third most important application, also first proposed by Professor Wheatstone, and announced in the 'Bull-tins of the Royal Academy of Sciences of Brussels,' October 1840, is the registration and transmission of transit observations at distant stations. Another is the electro-magnetic chronoscope, announced in the same work, for the measurement of extremely short intervals of time.

Other papers by Professor Wheatstone, communicated to the Royal Society, and, together with those already noticed, inserted in the 'Philosophical Transactions,' or in the 'Proceedings,' are the following: —An account of several new instruments and processes for determining the constants of a voltaic circuit, founded on Ohm's theory;—Note relating to M. Foucault's new mechanical proof of the rotation of the earth;—the Bakerian Lecture for 1852, being Part II. of Contributions to the Physiology of Vision, and on Binocular Vision, in continuation;—on Fessel's gyroscope;—on the formation of powers from arithmetical progressions;—account of some experiments made with the submarine cable, &c.;—on the position of aluminum in the voltaic series. The Royal Medal of the Society for 1840, was awarded to Mr. Wheatstone for his researches in double vision, but also, in the words of the President (the late Marquis of Northampton) in presenting the medal, "for the science and ingenuity by which he had measured electrical velocity, and by which he had also opened his acquaintance with galvanism to the most important practical purposes." The royal medal was again awarded to him in 1843, for his paper on processes for determining the constants of a voltaic circuit, mentioned above.

As Professor Wheatstone's experiments on the velocity of electricity have been mentioned several times in this article, it is requisite to observe that Professor Faraday, with his peculiar mastery of electric science, had inferred (as is known to the present writer) shortly after their publication, that the velocity of electrical discharge through the same wire might be greatly varied by the amount and disposition of the surrounding previous inductive action. In 1838 he published this in his well-known 'Experimental Researches.' Having afterwards fully verified this influence by the electric telegraph, and experiments by various inquirers having proved that the difference of velocity in copper-wire might even be as a hundred to one, at the first evening meeting of the Royal Institution in 1854, he returned to the subject, and fully explained the causes of variation. An explicit view of the actual state of science on this interesting subject, has been given by Professor De la Rive, in his Treatise on Electricity lately published, translated by Mr. Charles Vincent Walker, F.R.S., superintendent telegrapher of the South-Eastern Railway. A final expression for the velocity of electricity, it would appear, has not yet been obtained; nor has it been shown in what the *prima facie* difference between the mode of propagation of electricity, and that of the radiant forces, such as light, heat, &c., really consists.

Professor Wheatstone was one of the jurors of the Paris Universal Exhibition of 1855, in the class for "heat, light, and electricity;" on which occasion he was appointed by the Emperor Napoleon III. a knight of the Legion of Honour, "for his application of the electric telegraph." He is also a correspondent of the French Institute of Sciences, and a foreign or an honorary member of the principal academies of science in Europe.

At King's College, we believe, like other titular professors, he has not taken any part in the routine of academic instruction; but he has occasionally lectured, as we have seen, on special subjects related to his own researches; giving also to his colleagues the advantageous aid of his peculiar knowledge and talent, and to the college the benefit of his philosophical reputation. In two previous articles [MILLER, WILLIAM ALLEN, and SMITH, WILLIAM,] the researches which con-

Digitized by Google

firmed the selection of magnesian limestone for building the New Palace of Westminster, have been noticed. The physical and chemical examination of the specimens of stone collected, having been consigned to the late Professor Daniell and his colleague Professor Wheatstone, the requisite experiments on their mechanical and hygrometrical properties were committed by the latter. He was knighted 1868.

WHEWELL, REV. WILLIAM, D.D., F.R.S., Master of Trinity College, Cambridge, was born in 1795, at Lancaster, where his father was a joiner, and intended to place his son with himself at 'the bench.' But fortunately he had received an excellent education of its degree at the Free Grammar Shool of his native town, the head master of which, perceiving the mathematical talent evinced by his pupil, with his father's assent, took measures for giving him an university education, and enabled him to enter Trinity College, Cambridge, where he graduated as B.A. in 1816, afterwards became a Fellow of his college, and was for many years an eminent and successful tutor. In 1828 he was appointed Professor of Mineralogy, which office he retained until 1832. In 1838 he became Professor of Moral Theology or Casuistry, retaining the chair until he took the office of Vice-Chancellor of the University, in 1855. He succeeded to the Mastership of Trinity College, which he still holds, in 1841. It has been stated that not long after the great improvement in the mathematical education of Cambridge, based on the introduction of the methods of the French masters of analysis, had been fully accomplished and its effects realised, it induced a tendency in the students to disregard the definite study of physics and the knowledge of nature, in the implicit belief that they were virtually superseded by mathematics, and that the latter included everything necessary to be known of the former. It is also said that one of the first of the distinguish-d graduates who perceived, and in his own case rectified this error, by the diligent study of physics and natural science, was Mr. Whewell; and further, that the study of mineralogical science and crystallography, by which he was prepared for holding the chair of mineralogy at Cambridge, was at once a part and one of the first fruits of this corrective system. Though not present at the first meeting of the British Association, he was nominated on the sub-committee (or section) of Mineralogy, and also one of the two vice-presidents of the Association for the second meeting held at Oxford, and requested to present to it a report on the state and progress of Mineralogy. This he promised accordingly, and to form a part of the first volume of the Reports of the Association, being second to none contained in the remarkable collection of reports on the progress of various branches of mathematical, physical, and practical knowledge obtained and published by the Association. It was afterwards incorporated by the author into his 'History of the Inductive Sciences,' to which we shall return.

We have seen, in effect, what an important part in his own university Dr. Whewell's unusual combination of extensive and multifarious knowledge, with a power of intellect more generally found concentrated on a few objects only, enabled him to take. A similar course in the Cambridge Philosophical Society was almost inseparable from this. But he has taken an equally prominent part in the Royal Society (of which he became a Fellow on the 13th of April 1820,) and in the British Association for the Advancement of Science, of which latter he was President in the year 1841, at the Plymouth meeting. At the third meeting, held at Cambridge in 1833, he had delivered an address on the desiderata and prospects of the Association and of science. The fifth volume of the Reports contains his 'Report on the recent progress and present condition of the mathematical theories of electricity, magnetism, and heat.' The subject of the Tides, equally important in its philosophical and practical relations, has received the most valuable accessions from Dr. Whewell, whose discussions of tide-observations (many of which were made by direction of the British Association at his instigation) will be found in a series of papers in the 'Philosophical Transactions.' For two years Dr. Whewell filled the chair of the Geological Society, directing the Fellows, in their papers and discussions, to the definite and comprehensive principles suggested, in application to Geology, by the peculiar culture of his own mind, and taking, in his annual addresses, equally valuable, broad, and philosophical views of geological theory and causation.

Several of Dr. Whewell's separate works and their contents have been alluded to in a former article, when noticing the contributions to science of one of his accomplished colleagues at Cambridge [WILLIS, REV. R.]. He is the author of many works in the tutorial series of the university on various departments of mathematics and physics. But the more considerable productions of his pen are the following:—'Astronomy and General Physics considered with reference to Natural Theology; being the Third Bridgewater Treatise,' London, 1833. In this may be recognised the rudiments of much that the author has since produced, as well as an earlier example of the style matured in the works next to be mentioned. 'History of the Inductive Sciences, from the earliest to the present times,' 3 vols., London, 1837; 'The Philosophy of the Inductive Sciences, founded upon their History,' 2 vols., London, 1840, 'The Elements of Morality, including Polity,' 2 vols., London, 1855.

On the first two works of this list, considered as a whole, Professor James Forbes, F.R.S., the successor of Playfair in the chair of natural philosophy in the University of Edinburgh, (in his Dissertation on the progress of mathematical and physical science from 1750 to 1850, in the eighth edition of the 'Encyclopædia Britannica,') remarks, 'One attempt—a bold and successful one—has been made, in our own day, to unite the history of science and the logic of inductive discovery,—I mean the History and Philosophy of the Inductive Sciences. An English philosopher of wonderful versatility, industry, and power has erected a permanent monument to his reputation in a voluminous work bearing the preceding title.' They are also the subject of a celebrated article in the 'Quarterly Review,' by Sir John Herschel, lately republished in his volume of Essays. A well known work, which has excited much controversy, on the Plurality of Worlds, has been very generally attributed to Dr. Whewell, but, as far as we know, its authorship has been neither admitted nor denied by him. [*See* SUPPLEMENT.]

WINSLOW, FORBES, M.D., born in 1810, a physician and writer on psychology, was educated for the medical profession in London, and became a member of the Royal College of Surgeons of England in 1835. He is also a graduate in medicine of King's College, Aberdeen, and a fellow of the Royal College of Physicians of Edinburgh; and he has received the honorary degree of Doctor of Civil Law from the University of Oxford. One of his earliest published works indicates the direction of his mind. It is entitled 'An Essay on the Application of the Principles of Phrenology to the Elucidation and the Cure of Insanity.' This was published in 1831. About this time he also published two manuals for the use of students, 'A Manual of Osteology,' and 'A Manual of Practical Midwifery.' His next work was one which resulted from the literary bent of his genius. It was called 'Physic and Physicians.' It consisted of biographical and literary sketches of the history of medicine, and produced a considerable sensation at the time it was published. It indicated clearly the workings of a mind that was studying with eagerness the road to success. He afterwards published a work more particularly directed to the speciality which he afterwards so successfully practised. This work was entitled 'The Anatomy of Suicide; being an attempt to establish the connection between the Desire to commit Suicide and certain physical conditions of the Brain and Abdominal Organs.' From this time Dr. Winslow devoted himself entirely to the treatment of insanity, and opened an asylum at Sussex House, Hammersmith, of which he was resident superintendent for many years. His consultation practice however increasing largely, he has recently taken a house in London, still carrying on the establishment at Hammersmith. Besides the above works, he is also author of the following, devoted to the subject of insanity: 'On the Preservation of the Health of the Body and Mind;' 'On the Plea of Insanity in Criminal Cases;' 'On the Act for the Better Regulation and Care of the Insane, with Notes;' 'Synopsis of the Lunacy Act.' In 1837 he was appointed Lettsonian Lecturer to the Medical Society of London, and on this occasion delivered a course of lectures on insanity, which have since been published. In 1848 he projected and became proprietor and editor of the 'Quarterly Journal of Psychological Medicine and Mental Pathology.' He has contributed extensively to the pages of this journal, and through it has been the means of diffusing a large amount of sound opinion on the subject of insanity and its treatment. As a great principle on which Dr. Winslow has laid the greatest stress, is the fact that there can be no derangement of the mind without some antecedent derangement of the body. To this subject he has devoted many papers. In 1860 he published a volume 'On the Obscure Diseases of the Brain.'

In 1853 Dr. Winslow was elected president of the London Medical Society. He is now (1857) president of the Association of the Medical Officers of Hospitals and Asylums for the Insane.

THE END.

THE following is a list of the names of persons who have died since the publication of the 'Penny Cyclopædia,' and of "those living names" which, in accordance with the announcement in the Prospectus, are included in the sixth volume of the Biographical Division of the 'English Cyclopædia.' The asterisk is prefixed to names of living persons:—

*Tholuck, Friedrich-August-Gottreu
Thom, James
Thom, William
*Thompson, Major-Gen. T. Perronet
Thomson, William
*Thoms, William J.
Thomson, Anthony Todd, M.D.
Thomson, Mrs. A. T.
Thomson, Thomas, M.D.
*Thoburn, Robert, A.R.A.
Thorkelin, Grim Jonsson
*Tickner, George
Tieck, Christian Friedrich
Tieck, Ludwig
Tiedemann, Friedrich
*Tite, William, M.P., F.R.S.
Tocqueville, Henri-Alexis, Count de
Todd, Robert Bentley, M.D., F.R.S.
*Todleben, Francis Edward
Toilens, Hendrik Cornelisszon
*Tommaseo, Niccolo
Tooke, Thomas
Tooke, William, F.R.S.
Toreno, Don José, Count of
Torrijos, José Maria
*Toussaint, Anna Luise Geertruide
Tredgold, Thomas
*Trench, Rev. R. Chenevix, Dean of Westminster
*Trentowski, Bronislaw Ferdynand
*Tricoupi, or Trikupis, Spiridion
Trithen, Frederick Henry
Trollope, Frances
Truebe y Costa, Telesforo de
Truro, Lord
*Turner, Martin Farquhar, D.C.L., F.R.S.
Turgenev, Alexander Ivanovich
*Turgenev, Nikolai Ivanovich
*Turgenev, Ivan
Turner, Dawson
Turner, J. M. W.
Turner, Sharon
*Turner, Rev. Sydney
Turner, Thomas Hudson
*Turton, William, M.D.
Tytler, Patrick Fraser
Uhland, Johann Ludwig
*Ulmann, Karl
*Ulrici, Hermann
Umbreit, Friedrich Wilhelm Karl
Ure, Andrew, M.D.
Uwins, Thomas, R.A.
Uvarov, Sergy Semenovich
*Uvarov, Alexei Sergievich
Ux, Johann Peter
Valpy, Rev. Richard, D.D.
Varnhagen Von Ense, Karl August
Varnhagen, Rahel Antonie
*Vaughan, Rev. Robert, D.D.
*Veit, Philipp
*Verdi, Giuseppe
Vernet, Horace
Vernon, Robert
*Victor-Emmanuel II.
*Victoria Alexandrina, Queen of Great Britain and Ireland
Vidocq, Francis-Jules
Vigny, Alfred, Comte de
Villanueva, Joaquin Lorenzo de
Villemain, Abel-Francois
Vinet, Alexandre-Rodolphe
Viny, Julien-Joseph
Visconti, Louis Joachim
Vogel, Dr. Edward
*Vorösmarty, Mihaly or Michael
Wagen, Gustav Friedrich
Waghorn, Lieut. Thomas, R.N.
*Wagner, Richard
Wakefield, Edward Gibbon
Wallis, Johann Olof
Walter, John
*Waltor, John
Warburton, Eliot
Ward, James, R.A.
*Ward, Matthew Edward, R.A.
Ward, Robert Plumer
Ward, Sir Henry George
Wardlaw, Ralph, D.D.
Warneford, Rev. S. W.
*Warren, Samuel, Q.C., M.P.
Washington, Capt. J., R.N., F.R.S.
Watt, James
Watt, James Henry
Watts, Alaric Alexander
Weaver, Thomas
*Weber, Wilhelm Eduard
Webster, Daniel
*Webster, Thomas, R.A.
Weiss, Christian Samuel
*Welcker, Friedrich Gottlieb
*Welcker, Karl Theodor
Wellington, Duke of
Wergeland, Henrik Arnold
Westall, William, A.R.A.
Westmacott, Sir Richard, R.A.
*Westmacott, Richard, R.A.
Westmoreland, J. Fane, 11th Earl of
*Weyer, Silvain de
Whately, Archbishop
Wheaton, Henry
*Widmann, Max
*Wiesinger, Peter
Wilken, Jeremiah Holme
*Wilberforce, Rt. Rev. Samuel, Bishop of Oxford
*Wilkinson, Sir John Gardner
Willems, Jan Frans
William II., King of the Netherlands
*William III., King of the Netherlands
Williams, Samuel
*Williams, Sir W. F., of Kars
Willis, Nathaniel Parker
*Willis, Rev. Robert, M.A., F.R.S.
Willmore, James Tibbets
*Wilis, William Henry
Wilson, Horace Hayman
Wilson, James
Wilson, Professor John
Wilson, General Sir R. T.
*Windham, Major-Gen. Charles Ash
*Winer, Georg Benedict
Wina, Peter de
*Winterhalter, Franz Xavier
*Winther, Christian
Wiseman, Nicholas, Cardinal
Withenington, Wm. Frederick, R.A.
*Wolff, Emil
Wordsworth, Rev. Christopher, D.D.
*Wordsworth, Rev. Christopher, D.D.
Wordsworth, William
*Wornum, Ralph Nicholson
Woronzow, Mikhail Semenovich, Prince
*Worsaae, Jens Jacob Asmussen
*Wrangel, Ferdinand Petrovich von
Wraxall, Sir Nathaniel Wm., Bart.
Wrede, Karl Philip, Prince
*Wright, Thomas, F.S.A.
*Wright, Thomas, of Manchester
Wrottesley, John, Lord
*Wyatt, Matthew Digby
Wyatt, Richard J.
Wyon, William
Yorck von Wartenburg, Hans David Ludwig, Graf
*Young, Brigham
Young, Thomas, M.D.
Zach, Francis Xavier, Baron von
Zagoskin, Mikhail Nikolaevich
Zaitzmann, Vice-Admiral Christian
Zhukovsky, Vasily Andreevich
Zingarelli, Nicolo
*Zorrilla y Moral, Don José
Zschokke, Johann Heinrich Daniel
Zschokkenarrgul, Tomas
Zumpt, Carl Gottlob

SUPPLEMENTARY NAMES.

A Becket, Gilbert Abbott
Amherst, Earl
*Ansted, David Thomas
*Arpelander, Friedrich Wilhelm A.
Auckland, Earl of
Aytoun, William Edmondstoune
*Bailey, Philip James
Baines, Edward
Baines, Matthew Talbot
*Baines, Edward
*Baifo, Michael William
*Balfour, John Hutton
Beaufort, Rear-Admiral Sir Francis
Behnes, William
*Benedict, Jules
*Bennett, William Sterndale
Bingham, Joseph
Bonstetten, Karl Victor von
*Bowerbank, John Scott
Brande, W. T.
Brayley, Edward Wedlake, F.S.A.
*Brayley, Edward William, F.R.S.
*Brooks, Charles Shirley
Burgess, Sir Samuel Egerton
*Busk, George
Canning, Charles John, Viscount
Cathcart, Gen. Sir George
*Chasles, Victor-Euphemion-Philarète
*Costa, Michael
Crawford, Thomas
Crosse, Andrew
*Dove, Heinrich Wilhelm
*Edwards, Henri-Milne
*Farr, William, M.D., F.R.S.
*Gayangos, Pascual de
Gmelin, Leopold
Gogol, Nikolay Ivanovich
*Graham, Thomas
*Grant, Robert, M.A., F.R.A.S.
Grotefend, Georg Friedrich
*Grove, William Robert, Q.C., M.A.
Haldane, Robert
Haldane, James Alexander
Hasley, Premeselthal
Hammer-Purgstall, J., Baron von
Havelock, Major-Gen. Sir Henry
Henfrey, Arthur
Henslow, Rev. John Stevens, M.A.
Herapath, William
Horsfield, Thomas, M.D.
*Huilah, John
*Huxley, Thomas Henry
*Julien, Stanislas-Aignan
*Livingstone, David, LL.D., D.C.L.
*Maury, Matthew Fontaine, LL.D.
Monk, Dr. James Henry
*Parkes, Josiah
Parkes, Joseph
Rendel, James Meadows
Rigaud, Stephen Peter, M.A., F.R.S.
*Russell, John Scott, F.R.S.
*Sabine, Major-General Edw., R.A.
*Schleiden, M. J.
*Simpson, James Young, M.D.
Smyth, Rear-Admiral Wm. Henry
Sowerby, James
Sowerby, George de Carle
Sowerby, George Brettingham
Sowerby, Charles Edward
*Sowerby, George Brettingham, jun.
*Sowerby, Henry
*Taylor, Alfred Swaine
*Tschudi, Johann Jakob von
Vico, Francis de
Wallich, Nathaniel, M.D.
*Wheatstone, Charles, F.R.S.
Whewell, Rev. William, D.D.
*Winslow, Forbes, M.D.
